Acknowledgments

The METeOR and Metadata Unit of the Australian Institute of Health and Welfare receives funding from the Australian Health Ministers' Advisory Council to produce and maintain the national standards for this *National health data dictionary* (NHDD). This includes producing biennial editions of the NHDD that are endorsed by the National Health Information Standards and Statistics Committee (NHISSC), and posting NHISSC-endorsed updates to the NHDD on METeOR every 6 months.

Contents

Acknowledgments	iii
Summary of updates to the <i>National health data dictionary</i> (NHDD) since version 14.....	1
National health data dictionary version 15.....	23
Data elements.....	23
Accrued mental health care days.....	24
Activity and participation life area.....	27
Activity when injured	30
Activity when injured (non-admitted patient)	31
Actual place of birth	33
Acute coronary syndrome procedure type	35
Acute coronary syndrome related clinical event type.....	38
Acute coronary syndrome related medical history.....	42
Acute coronary syndrome stratum	46
Additional diagnosis	49
Address line (person)	51
Address line (service provider organisation)	54
Address type (person).....	57
Address type (service provider organisation)	60
Address – country identifier (person).....	62
Administrative health region name	64
Administrative health region palliative care strategic plan indicator.....	65
Admission date	67
Admission time	70
Admitted patient election status.....	71
Age.....	74
Age range.....	76
Alcohol consumption frequency (self reported).....	78
Alcohol consumption in standard drinks per day (self reported)	80
Anaesthesia administered for operative delivery of the baby.....	82
Analgesia administered for labour.....	84
Angina status.....	86
Angiotensin converting enzyme (ACE) inhibitors therapy status.....	88
Anticipated patient election status	90
Apgar score at 1 minute	92
Apgar score at 5 minutes	93
Area of practice – dental	95

Data elements (continued)

Area of practice – midwifery.....	98
Area of practice – nursing.....	101
Area of practice – psychology	104
Area of usual residence.....	106
Aspirin therapy status.....	109
Assistance with activities.....	111
Australian State/Territory identifier (establishment)	114
Australian State/Territory identifier (jurisdiction).....	119
Australian state of birth	121
Australian state/territory identifier	124
Australian state/territory identifier (service provider organisation).....	126
Average available beds for hospital-in-the-home patients	128
Average available beds for overnight-stay patients	130
Average available beds for residential mental health patients	133
Average available beds for same-day patients	135
Average available neonatal cots (non-special-care)	138
Behaviour-related risk factor intervention	140
Behaviour-related risk factor intervention – purpose	142
Beta-blocker therapy status	144
Birth order.....	146
Birth plurality	148
Bleeding episode using TIMI criteria (status).....	150
Blindness (diabetes complication).....	152
Blood pressure – diastolic (measured).....	154
Blood pressure – systolic (measured)	157
Bodily location of main injury.....	160
Body function	163
Body mass index – adult (measured).....	166
Body mass index – adult (self-reported).....	169
Body mass index – child (measured)	172
Body mass index – child (self-reported)	175
Body mass index – classification.....	178
Body structure	183
Building/complex sub-unit number (person)	186
Building/complex sub-unit number (service provider organisation)	188
Building/complex sub-unit type – abbreviation (person)	189
Building/complex sub-unit type – abbreviation (service provider organisation)	191
Building/property name (person).....	193
Building/property name (service provider organisation)	195

Data elements (continued)

Bundle-branch block status	197
C-reactive protein level (measured)	198
CVD drug therapy – condition	199
Caesarean section indicator, last previous birth	201
Cancer initial treatment completion date	202
Cancer initial treatment starting date	203
Cancer staging – M stage code	204
Cancer staging – N stage code	206
Cancer staging – T stage code	208
Cancer staging – TNM stage grouping code	210
Cancer treatment type	212
Cancer treatment – target site (ICD-10-AM)	214
Cancer treatment – target site (ICDO-3)	215
Capital consumption expenses	216
Cardiovascular medication (current)	218
Care type	220
Carer participation arrangements – carer consultants employed	227
Carer participation arrangements – carer satisfaction surveys	229
Carer participation arrangements – formal complaints mechanism	231
Carer participation arrangements – formal participation policy	233
Carer participation arrangements – regular discussion groups	235
Cataract – history	237
Category reassignment date	239
Census date	240
Centrelink customer reference number	241
Cerebral stroke due to vascular disease (history)	243
Change to body structure	244
Chest pain pattern category	247
Cholesterol – HDL (measured)	249
Cholesterol – LDL (calculated)	251
Cholesterol – total (measured)	253
Classification of health labour force job	255
Client type (alcohol and other drug treatment services)	258
Clinical evidence of acute coronary syndrome related medical history	260
Clinical procedure timing (status)	263
Clinical urgency	264
Clopidogrel therapy status	266
Co-location status of mental health service	268
Compensable status	270

Data elements (continued)

Complication of labour and delivery	272
Complications of pregnancy	273
Condition onset flag	274
Congenital malformations	277
Congenital malformations – BPA code.....	278
Consumer committee representation arrangements.....	279
Consumer participation arrangements – consumer consultants employed.....	281
Consumer participation arrangements – consumer satisfaction surveys.....	283
Consumer participation arrangements – formal complaints mechanism.....	285
Consumer participation arrangements – formal participation policy.....	287
Consumer participation arrangements – regular discussion groups	289
Contract establishment identifier	291
Contract procedure flag.....	292
Contract role	293
Contract type	294
Contracted care commencement date.....	296
Contracted care completion date.....	297
Coordinator of volunteers indicator	298
Coronary artery bypass graft location	300
Coronary artery disease – history of intervention or procedure.....	301
Coronary artery stenosis location.....	303
Country of birth	304
Country of employment in registered profession.....	308
Creatine kinase MB isoenzyme level (index code).....	310
Creatine kinase MB isoenzyme level (kCat per litre).....	312
Creatine kinase MB isoenzyme level (micrograms per litre).....	314
Creatine kinase MB isoenzyme level (nanograms per decilitre).....	316
Creatine kinase MB isoenzyme level (percentage).....	318
Creatine kinase MB isoenzyme level (units per litre)	320
Creatine kinase MB isoenzyme – upper limit of normal range (units per litre)	322
Creatine kinase MB isoenzyme – upper limit of normal range (index code).....	323
Creatine kinase MB isoenzyme – upper limit of normal range (kCat per litre).....	324
Creatine kinase MB isoenzyme – upper limit of normal range (micrograms per litre)	326
Creatine kinase MB isoenzyme – upper limit of normal range (nanograms per decilitre) ...	327
Creatine kinase MB isoenzyme – upper limit of normal range (percentage).....	329
Creatine kinase isoenzyme – upper limit of normal range (U/L)	331
Creatine kinase level (U/L).....	332
Creatinine serum level (measured)	334
Date C-reactive protein level measured	337

Data elements (continued)

Date accuracy indicator.....	338
Date creatine kinase MB isoenzyme measured	342
Date creatinine serum level measured.....	343
Date of acute coronary syndrome related clinical event	344
Date of birth.....	345
Date of cessation of treatment episode for alcohol and other drugs	353
Date of change to qualification status	355
Date of commencement of treatment episode for alcohol and other drugs	356
Date of completion of last previous pregnancy.....	358
Date of coronary artery bypass graft.....	359
Date of death	360
Date of diagnosis.....	362
Date of diagnosis of cancer.....	363
Date of diagnosis of first recurrence	365
Date of diagnostic cardiac catheterisation.....	366
Date of electrocardiogram	367
Date of first contact.....	368
Date of first delivery of service	370
Date of functional stress test	372
Date of implantable cardiac defibrillator procedure	373
Date of intra-aortic balloon pump procedure.....	374
Date of intravenous fibrinolytic therapy	375
Date of last contact.....	376
Date of most recent stroke	378
Date of non-invasive ventilation administration.....	379
Date of onset of acute coronary syndrome symptoms	380
Date of pacemaker insertion.....	382
Date of primary percutaneous coronary intervention.....	383
Date of procedure	384
Date of referral to rehabilitation	385
Date of rescue percutaneous coronary intervention.....	387
Date of revascularisation percutaneous coronary intervention	388
Date of surgical treatment for cancer	389
Date of triage	390
Date of ventricular ejection fraction test.....	392
Date patient presents.....	393
Date troponin measured	395
Day program attendances.....	396
Degree of spread of cancer	397

Data elements (continued)

Department of Veterans' Affairs file number	400
Department of Veterans' Affairs patient	403
Dependency in activities of daily living – bathing.....	405
Dependency in activities of daily living – bed mobility.....	407
Dependency in activities of daily living – bladder continence.....	409
Dependency in activities of daily living – bowel continence.....	411
Dependency in activities of daily living – day-time technical nursing care requirement	413
Dependency in activities of daily living – dressing	415
Dependency in activities of daily living – eating	417
Dependency in activities of daily living – evening technical nursing care requirement.....	419
Dependency in activities of daily living – extra surveillance	421
Dependency in activities of daily living – infrequent technical nursing care requirement ...	423
Dependency in activities of daily living – mobility	425
Dependency in activities of daily living – night-time technical nursing care requirement ...	427
Dependency in activities of daily living – toileting	429
Dependency in activities of daily living – transferring	431
Diabetes status.....	433
Diabetes therapy type	436
Diagnosis related group.....	438
Difficulty with activities.....	440
Division of General Practice number	443
Dyslipidaemia treatment indicator	444
ECG – Q waves indicator.....	446
Electrocardiogram – new Q waves indicator.....	448
Electrocardiogram – ST-segment-elevation in lead V4R.....	450
Electrocardiogram – lead V4R presence indicator	452
Electrocardiogram change location.....	453
Electrocardiogram change type	455
Electronic communication address (person).....	457
Electronic communication address (service provider organisation)	459
Electronic communication medium (person)	461
Electronic communication medium (service provider organisation).....	463
Electronic communication usage code (person).....	465
Emergency department arrival mode – transport.....	467
Emergency department date of commencement of service event	469
Emergency department departure date.....	472
Emergency department departure time	474
Emergency department episode end date.....	476
Emergency department episode end time.....	478

Data elements (continued)

Emergency department service episode end status.....	480
Emergency department time of commencement of service event.....	482
Emergency department waiting time to admission.....	485
Emergency department waiting time to service delivery.....	487
Employee expenses.....	488
Employment status (admitted patient).....	490
Employment status – health professional.....	492
Employment status – public psychiatric hospital admissions.....	494
Environmental factor.....	496
Episode of residential care end date.....	499
Episode of residential care end mode.....	501
Episode of residential care start date.....	503
Episode of residential care start mode.....	505
Erectile dysfunction.....	507
Establishment identifier.....	509
Establishment number.....	516
Establishment sector.....	519
Establishment type.....	523
Extended leave status in registered profession.....	528
Extended wait patient.....	530
Extent of participation.....	532
External cause.....	535
External cause (non-admitted patient).....	537
External cause – human intent.....	540
Family name.....	542
Fasting status.....	547
Feedback collection indicator.....	549
Feedback collection method.....	551
Fibrinolytic drug used.....	553
Fibrinolytic therapy status.....	554
Field of medicine – medical practitioner.....	556
First day of the last menstrual period.....	558
Floor/level number (person).....	559
Floor/level number (service provider organisation).....	561
Floor/level type (person).....	563
Floor/level type (service provider organisation).....	565
Foot deformity.....	567
Foot lesion (active).....	569
Foot ulcer (history).....	571

Data elements (continued)

Foot ulcer (current)	573
Formal community support access status	575
Full-time equivalent staff (mental health) – all staff	577
Full-time equivalent staff – administrative and clerical staff	580
Full-time equivalent staff – average	583
Full-time equivalent staff – carer consultants	585
Full-time equivalent staff – consultant psychiatrists and psychiatrists	587
Full-time equivalent staff – consumer consultants	589
Full-time equivalent staff – diagnostic and health professionals	591
Full-time equivalent staff – domestic and other staff	594
Full-time equivalent staff – enrolled nurses	597
Full-time equivalent staff – occupational therapists	600
Full-time equivalent staff – other diagnostic and health professionals	602
Full-time equivalent staff – other medical officers	604
Full-time equivalent staff – other personal care staff	606
Full-time equivalent staff – psychiatry registrars and trainees	609
Full-time equivalent staff – psychologists	611
Full-time equivalent staff – registered nurses	613
Full-time equivalent staff – salaried medical officers	616
Full-time equivalent staff – social workers	619
Full-time equivalent staff – student nurses	621
Full-time equivalent staff – trainee/pupil nurses	623
Functional stress ischaemic and perfusion outcome result	625
Functional stress test assessment of cardiac perfusion	627
Functional stress test element	628
Functional stress test intensity	629
Functional stress test performed indicator	631
Funding source for hospital patient	632
Geographical location of establishment	636
Geographical location of service delivery outlet	638
Gestational age	640
Given name sequence number	642
Given name(s)	644
Glycoprotein IIb/IIIa receptor antagonist (status)	650
Glycosylated Haemoglobin – upper limit of normal range (percentage)	652
Glycosylated haemoglobin level (measured)	654
Goal of care	656
Grants to non-government organisations – accommodation services	659
Grants to non-government organisations – advocacy services	662

Data elements (continued)

Grants to non-government organisations – community awareness/health promotion services.....	664
Grants to non-government organisations – counselling services	666
Grants to non-government organisations – independent living skills support services	668
Grants to non-government organisations – other and unspecified mental health services ...	670
Grants to non-government organisations – pre-vocational training services	673
Grants to non-government organisations – psychosocial support services	675
Grants to non-government organisations – recreation services	677
Grants to non-government organisations – respite services.....	679
Grants to non-government organisations – self-help support group services.....	681
Gross capital expenditure (accrual accounting) – buildings and building services.....	683
Gross capital expenditure (accrual accounting) – constructions.....	685
Gross capital expenditure (accrual accounting) – equipment	687
Gross capital expenditure (accrual accounting) – information technology	689
Gross capital expenditure (accrual accounting) – intangible assets	691
Gross capital expenditure (accrual accounting) – land	693
Gross capital expenditure (accrual accounting) – major medical equipment	695
Gross capital expenditure (accrual accounting) – other equipment.....	697
Gross capital expenditure (accrual accounting) – transport	699
Gross capital expenditure – computer equipment/installations	701
Gross capital expenditure – intangible assets	703
Gross capital expenditure – land and buildings.....	705
Gross capital expenditure – major medical equipment.....	707
Gross capital expenditure – other.....	709
Gross capital expenditure – plant and other equipment.....	711
Group sessions (public psychiatric, alcohol and drug hospital) – emergency and outpatient	713
Group sessions (public psychiatric, alcohol and drug hospital) – outreach and community	715
Group sessions – alcohol and other drug.....	717
Group sessions – allied health services.....	719
Group sessions – community health services	722
Group sessions – dental	725
Group sessions – dialysis.....	727
Group sessions – district nursing services	729
Group sessions – emergency services	732
Group sessions – endoscopy and related procedures	734
Group sessions – mental health	737
Group sessions – other medical/surgical/diagnostic	739
Group sessions – other outreach services.....	741

Data elements (continued)

Group sessions – pathology	744
Group sessions – pharmacy.....	746
Group sessions – radiology and organ imaging.....	748
Health industry relevant organisation type.....	750
Health professionals attended (diabetes mellitus).....	761
Heart rate	763
Heart rhythm type.....	764
Height (measured).....	766
Height (self-reported).....	770
Hip circumference (measured)	773
Histopathological grade.....	776
Hospital insurance status.....	778
Hours on-call (not worked) by medical practitioner	780
Hours worked in health profession – clinical	781
Hours worked in health profession – non-clinical	783
Hours worked in health profession – private sector.....	785
Hours worked in health profession – public sector	787
Hours worked in health profession – total.....	789
House/property number (person)	792
House/property number (service provider organisation).....	794
Household annual gross income range	796
Household annual gross income range (\$10,000 range).....	798
Human epidermal growth factor receptor-2 test result.....	800
Human epidermal growth factor receptor-2 test type.....	803
Hypertension – treatment.....	805
Hypoglycaemia – severe.....	807
Impairment of body function.....	809
Impairment of body structure.....	812
Indicator procedure.....	815
Indigenous status.....	819
Individual sessions (public psychiatric, alcohol and drug hospital) – emergency and outpatient	827
Individual sessions (public psychiatric, alcohol and drug hospital) – outreach and community	829
Individual sessions – alcohol and drug.....	831
Individual sessions – allied health services.....	834
Individual sessions – community health services	836
Individual sessions – dental	839
Individual sessions – dialysis.....	842

Data elements (continued)

Individual sessions – district nursing services	845
Individual sessions – emergency services	848
Individual sessions – endoscopy and related procedures	851
Individual sessions – mental health	854
Individual sessions – other medical/surgical/diagnostic	857
Individual sessions – other outreach services.....	860
Individual sessions – pathology	863
Individual sessions – pharmacy.....	866
Individual sessions – radiology and organ imaging.....	869
Individual/group session indicator	871
Infant weight, neonate, stillborn.....	872
Influence of environmental factor	874
Informal carer existence indicator	878
Initial visit indicator – diabetes mellitus.....	881
Injecting drug use status.....	883
Instrumented bleeding location.....	885
Intended length of hospital stay	887
Intended place of birth.....	889
Intended years in health profession.....	891
Intention of treatment for cancer	893
Inter-hospital contracted patient	895
Interpreter services required	897
Jobseeker status in registered profession	898
Killip classification code	900
Labour force status	902
Laterality of primary cancer	905
Leave days from residential care.....	907
Length of employment in health profession.....	909
Length of non-admitted patient emergency department service episode.....	911
Length of stay	913
Length of stay (including leave days).....	914
Length of stay (including leave days) (antenatal).....	916
Length of stay (including leave days) (postnatal).....	918
Level of palliative care service	920
Lifestyle counselling type.....	922
Lipid-lowering therapy status	924
Listing date for care.....	926
Living arrangement.....	928
Location of impairment.....	930

Data elements (continued)

Lot/section number (person).....	933
Lot/section number (service provider organisation)	935
Lower limb amputation due to vascular disease	937
Lymphovascular invasion	939
Main language other than English spoken at home	941
Main occupation of person.....	944
Main treatment type for alcohol and other drugs	946
Major diagnostic category	949
Marital status.....	951
Maternal medical conditions.....	955
Maximum stenosis coronary artery.....	956
Medicare card number	957
Medicare eligibility status.....	959
Mental health legal status.....	962
Mental health service contact date	967
Mental health service contact duration.....	969
Mental health service contact – patient/client participation indicator	971
Mental health service contact – session type.....	973
Mental health services grants to non-government organisations by non-health departments	975
Method of birth	977
Method of use for principal drug of concern.....	979
Microalbumin level – albumin/creatinine ratio (measured).....	981
Microalbumin level – micrograms per minute (measured)	983
Microalbumin level – milligrams per 24 hour (measured)	985
Microalbumin level – milligrams per litre (measured).....	987
Microalbumin level – upper limit of normal range (albumin/creatinine ratio)	989
Microalbumin level – upper limit of normal range (micrograms per minute)	991
Microalbumin level – upper limit of normal range (milligrams per 24 hour)	993
Microalbumin level – upper limit of normal range (milligrams per litre).....	995
Minutes of operating theatre time	997
Mode of admission	998
Mode of separation.....	1000
Month and year of birth.....	1004
Morphology of cancer	1006
Most common service delivery setting	1008
Most valid basis of diagnosis of cancer	1010
Mother’s original family name.....	1013
Multi-disciplinary team status.....	1014

Data elements (continued)

Myocardial infarction (history).....	1015
Name context flag.....	1017
Name suffix	1019
Name suffix sequence number	1021
Name title.....	1023
Name title sequence number.....	1025
Name type.....	1027
Name type (service provider organisation)	1029
Narrative description of injury event.....	1031
National standards for mental health services review status.....	1033
Nature of main injury (non-admitted patient)	1036
Neo-adjuvant therapy	1039
Neonatal morbidity	1041
Net capital expenditure (accrual accounting) – buildings and building services.....	1042
Net capital expenditure (accrual accounting) – constructions	1044
Net capital expenditure (accrual accounting) – equipment.....	1046
Net capital expenditure (accrual accounting) – information technology	1048
Net capital expenditure (accrual accounting) – intangible assets	1050
Net capital expenditure (accrual accounting) – land	1052
Net capital expenditure (accrual accounting) – major medical equipment.....	1054
Net capital expenditure (accrual accounting) – other equipment.....	1056
Net capital expenditure (accrual accounting) – transport.....	1058
New/repeat status.....	1060
Non-Australian state/province (person).....	1061
Non-Australian state/province (service provider organisation).....	1063
Non-instrumented bleeding location	1064
Number of caesarean sections.....	1066
Number of contacts – psychiatric outpatient clinic/day program	1067
Number of coronary artery lesions attempted	1069
Number of coronary artery lesions successfully dilated.....	1070
Number of coronary artery stents	1071
Number of days in special/neonatal intensive care	1072
Number of days of hospital-in-the-home care.....	1074
Number of episodes of angina in last 24 hours	1077
Number of episodes of residential care	1078
Number of group sessions.....	1080
Number of leave periods	1082
Number of occasions of service	1083
Number of positive sentinel lymph nodes.....	1085

Data elements (continued)

Number of qualified days for newborns	1086
Number of regional lymph nodes examined	1088
Number of sentinel lymph nodes examined	1090
Number of service contact dates	1091
Number of service contacts within a treatment episode for alcohol and other drug	1092
Number of service events (non-admitted patient)	1094
Number of tobacco cigarettes smoked per day after 20 weeks of pregnancy	1096
Number of tobacco cigarettes smoked per day first 20 weeks of pregnancy	1098
Nursing diagnosis – other	1100
Nursing diagnosis – principal	1102
Nursing interventions	1104
Occasions of service (residential aged care services) – outreach/community	1108
Occasions of service (residential aged care services) – outpatient	1109
Oestrogen receptor assay result	1110
Onset of labour	1112
Ophthalmological assessment – outcome (left retina)	1114
Ophthalmological assessment – outcome (right retina)	1116
Ophthalmoscopy performed indicator	1118
Organisation end date	1120
Organisation expenses, total Australian currency	1121
Organisation name	1124
Organisation revenues	1126
Organisation start date	1129
Other drug of concern	1130
Other treatment type for alcohol and other drugs	1133
Other/Underlying cause of acute coronary syndrome	1136
Outcome of initial treatment	1138
Outcome of last previous pregnancy	1140
Outpatient clinic type	1141
Overdue patient	1148
Palliative care agency service delivery setting	1150
Parity	1152
Partner organisation type	1153
Patient days	1155
Patient listing status	1157
Patient present status (non-admitted patient)	1159
Patients in residence at year end	1160
Percutaneous coronary intervention procedure type	1162
Perineal status	1164

Data elements (continued)

Period of residence in Australia.....	1166
Peripheral neuropathy (status)	1168
Peripheral vascular disease in feet (status)	1171
Person identifier	1173
Person identifier type – health care (person)	1179
Pharmacotherapy type prescribed for acute coronary syndrome in hospital.....	1181
Pharmacotherapy type taken for acute coronary syndrome post discharge.....	1183
Physical activity sufficiency status	1185
Place of occurrence of external cause of injury (ICD-10-AM)	1188
Place of occurrence of external cause of injury (non-admitted patient).....	1190
Postal delivery point identifier (person).....	1192
Postal delivery point identifier (service provider organisation).....	1194
Postal delivery service number.....	1196
Postal delivery service type – abbreviation.....	1198
Postcode – Australian (person)	1200
Postcode – Australian (service provider organisation)	1203
Postcode – Australian (workplace).....	1205
Postcode – international (person)	1207
Postcode – international (service provider organisation)	1208
Postpartum complication.....	1209
Preferred language	1211
Pregnancy duration at the first antenatal care visit	1213
Pregnancy – current status	1215
Premature cardiovascular disease family history (status)	1216
Presentation at birth	1218
Previous pregnancies – ectopic.....	1220
Previous pregnancies – induced abortion	1222
Previous pregnancies – live birth	1224
Previous pregnancies – spontaneous abortion	1226
Previous pregnancies – stillbirth	1228
Previous specialised treatment	1230
Primary site of cancer (ICD-10-AM code)	1233
Primary site of cancer (ICDO-3 code)	1235
Principal diagnosis	1237
Principal drug of concern	1239
Principal role – health profession	1241
Procedure	1244
Proficiency in spoken English.....	1246
Progesterone receptor assay results	1249

Data elements (continued)

Proteinuria status.....	1251
Provider occupation category (self-identified) (ANZSCO 1st edition).....	1253
Provider occupation end date.....	1256
Provider occupation start date.....	1257
Purchase of goods and services	1258
Quality accreditation/certification standard – Australian Council on Healthcare Standards EQUIP	1261
Quality accreditation/certification standard – Australian Quality Council	1262
Quality accreditation/certification standard – ISO 9000 quality family.....	1263
Quality accreditation/certification standard – Quality Improvement Council.....	1264
Radiotherapy treatment type	1265
Reason for cessation of treatment episode for alcohol and other drugs	1267
Reason for non prescription of pharmacotherapy	1271
Reason for readmission – acute coronary syndrome.....	1273
Reason for removal from elective surgery waiting list.....	1277
Received radiation dose.....	1279
Recurrent expenditure (indirect health care) – public health and monitoring services	1281
Recurrent expenditure (indirect health care) – central administrations	1283
Recurrent expenditure (indirect health care) – central and statewide support services	1285
Recurrent expenditure (indirect health care) – other.....	1287
Recurrent expenditure (indirect health care) – patient transport services	1289
Recurrent expenditure (mental health) – non-salary operating costs	1291
Recurrent expenditure (mental health) – salaries and wages.....	1294
Recurrent expenditure (salaries and wages) – administrative and clerical staff	1296
Recurrent expenditure (salaries and wages) – carer consultants	1298
Recurrent expenditure (salaries and wages) – consultant psychiatrists and psychiatrists ..	1300
Recurrent expenditure (salaries and wages) – consumer consultants	1302
Recurrent expenditure (salaries and wages) – diagnostic and health professionals.....	1304
Recurrent expenditure (salaries and wages) – domestic and other staff	1306
Recurrent expenditure (salaries and wages) – enrolled nurses.....	1308
Recurrent expenditure (salaries and wages) – occupational therapists.....	1310
Recurrent expenditure (salaries and wages) – other diagnostic and health professionals ..	1312
Recurrent expenditure (salaries and wages) – other medical officers.....	1314
Recurrent expenditure (salaries and wages) – other personal care staff.....	1316
Recurrent expenditure (salaries and wages) – psychiatry registrars and trainees	1318
Recurrent expenditure (salaries and wages) – psychologists.....	1320
Recurrent expenditure (salaries and wages) – registered nurses.....	1322
Recurrent expenditure (salaries and wages) – salaried medical officers	1324
Recurrent expenditure (salaries and wages) – social workers	1326

Data elements (continued)

Recurrent expenditure (salaries and wages) – student nurses.....	1328
Recurrent expenditure (salaries and wages) – total.....	1330
Recurrent expenditure (salaries and wages) – trainee/ pupil nurses	1332
Recurrent expenditure – Department of Veterans’ Affairs funded	1334
Recurrent expenditure – National Mental Health Strategy funded	1336
Recurrent expenditure – State or Territory health authority funded	1338
Recurrent expenditure – administrative expenses.....	1340
Recurrent expenditure – depreciation	1343
Recurrent expenditure – domestic services.....	1346
Recurrent expenditure – drug supplies	1349
Recurrent expenditure – food supplies.....	1352
Recurrent expenditure – interest payments	1355
Recurrent expenditure – medical and surgical supplies	1358
Recurrent expenditure – non-salary operating costs (excluding depreciation).....	1361
Recurrent expenditure – other Commonwealth Government funded.....	1364
Recurrent expenditure – other State or Territory funded	1366
Recurrent expenditure – other patient revenue funded.....	1368
Recurrent expenditure – other recurrent expenditure.....	1370
Recurrent expenditure – other revenue funded	1372
Recurrent expenditure – patient transport.....	1374
Recurrent expenditure – payments to visiting medical officers.....	1376
Recurrent expenditure – recoveries funded.....	1379
Recurrent expenditure – repairs and maintenance	1381
Recurrent expenditure – superannuation employer contributions	1384
Recurrent expenditure – total.....	1387
Referral destination to further care (from specialised mental health residential care)	1390
Referral destination to further care (psychiatric patients)	1392
Referred to ophthalmologist (diabetes mellitus)	1394
Region code	1396
Region of first recurrence.....	1399
Regional lymph nodes positive	1401
Removal date.....	1403
Renal disease therapy.....	1405
Renal disease – end-stage (diabetes complication)	1407
Residential stay start date.....	1409
Residual expenditure (mental health service) – Mental Health Act Regulation or related legislation	1411
Residual expenditure (mental health service) – academic positions.....	1413
Residual expenditure (mental health service) – education and training	1415

Data elements (continued)

Residual expenditure (mental health service) – insurance	1417
Residual expenditure (mental health service) – mental health promotion.....	1419
Residual expenditure (mental health service) – mental health research.....	1421
Residual expenditure (mental health service) – other indirect expenditure	1423
Residual expenditure (mental health service) – patient transport services	1425
Residual expenditure (mental health service) – program administration	1427
Residual expenditure (mental health service) – property leasing costs	1429
Residual expenditure (mental health service) – service development	1431
Residual expenditure (mental health service) – superannuation.....	1433
Residual expenditure (mental health service) – support services.....	1435
Residual expenditure (mental health service) – workers compensation	1437
Resuscitation of baby – method	1439
Retirement status in registered profession.....	1441
Revenue – other	1443
Revenue – patient	1444
Revenue – recoveries	1445
Satisfaction with participation	1447
Scheduled admission date	1450
Separation date.....	1451
Separation time	1455
Separations.....	1456
Service contact date	1458
Service mode (non-admitted patient)	1460
Service type (non-admitted patient).....	1462
Sex	1465
Source of public and private revenue	1473
Source of referral to alcohol and other drug treatment service.....	1479
Source of referral to public psychiatric hospital.....	1482
Specialised mental health service program type.....	1484
Specialised mental health service setting	1487
Specialised mental health service target population	1489
Specialised mental health service – hours staffed	1492
Specialised mental health service – supported public housing places.....	1494
Specialised service indicators – acquired immune deficiency syndrome unit.....	1496
Specialised service indicators – acute renal dialysis unit.....	1498
Specialised service indicators – acute spinal cord injury unit	1500
Specialised service indicators – alcohol and drug unit.....	1502
Specialised service indicators – bone marrow transplantation unit.....	1504
Specialised service indicators – burns unit (level III)	1506

Data elements (continued)

Specialised service indicators – cardiac surgery unit	1508
Specialised service indicators – clinical genetics unit	1510
Specialised service indicators – comprehensive epilepsy centre	1512
Specialised service indicators – coronary care unit	1514
Specialised service indicators – diabetes unit	1516
Specialised service indicators – domiciliary care service	1518
Specialised service indicators – geriatric assessment unit	1520
Specialised service indicators – heart, lung transplantation unit	1522
Specialised service indicators – hospice care unit	1524
Specialised service indicators – in-vitro fertilisation unit	1526
Specialised service indicators – infectious diseases unit	1528
Specialised service indicators – intensive care unit (level III)	1530
Specialised service indicators – liver transplantation unit	1532
Specialised service indicators – maintenance renal dialysis centre	1534
Specialised service indicators – major plastic/reconstructive surgery unit	1536
Specialised service indicators – neonatal intensive care unit (level III)	1538
Specialised service indicators – neurosurgical unit	1540
Specialised service indicators – nursing home care unit	1542
Specialised service indicators – obstetric/maternity	1544
Specialised service indicators – oncology unit, cancer treatment	1546
Specialised service indicators – pancreas transplantation unit	1548
Specialised service indicators – psychiatric unit/ward	1550
Specialised service indicators – rehabilitation unit	1552
Specialised service indicators – renal transplantation unit	1554
Specialised service indicators – sleep centre	1556
Specialised service indicators – specialist paediatric	1558
Specialised service indicators – transplantation unit	1560
Specialist private sector rehabilitation care indicator	1561
Staging basis of cancer	1563
Staging scheme source	1565
Staging scheme source edition number	1567
Standards assessment indicator	1569
Standards assessment level	1571
Standards assessment method	1573
State/Territory of birth	1575
Status of the baby	1577
Street name (person)	1579
Street name (service provider organisation)	1581
Street suffix code (person)	1583

Data elements (continued)

Street suffix code (service provider organisation).....	1585
Street type code (person)	1587
Street type code (service provider organisation).....	1589
Suburb/town/locality name (person)	1591
Suburb/town/locality name (service provider organisation)	1593
Suburb/town/locality name (workplace).....	1595
Surgical specialty	1597
Surgical treatment procedure for cancer	1599
Systemic therapy agent name	1601
Teaching status.....	1603
Telephone number.....	1605
Telephone number type.....	1607
Time C-reactive protein level measured.....	1609
Time creatine kinase MB isoenzyme measured.....	1610
Time of acute coronary syndrome related clinical event	1611
Time of diagnostic cardiac catheterisation	1612
Time of electrocardiogram.....	1613
Time of implantable cardiac defibrillator procedure.....	1614
Time of intra-aortic balloon pump procedure	1615
Time of intravenous fibrinolytic therapy	1616
Time of non-invasive ventilation administration.....	1617
Time of onset of acute coronary syndrome symptoms	1618
Time of pacemaker insertion.....	1620
Time of primary percutaneous coronary intervention	1621
Time of rescue percutaneous coronary intervention	1622
Time of revascularisation percutaneous coronary intervention	1623
Time of triage	1625
Time of ventricular ejection fraction test.....	1627
Time patient presents	1628
Time troponin measured	1630
Timing of ACE-inhibitor prescription	1631
Timing of angiotensin II receptor blocker prescription.....	1633
Timing of antithrombin therapy prescription.....	1635
Timing of aspirin prescription	1637
Timing of beta-blocker prescription.....	1639
Timing of clopidogrel prescription	1641
Timing of glycoprotein IIb/IIIa inhibitor prescription.....	1643
Timing of statin prescription.....	1645
Tobacco smoking indicator, after 20 weeks of pregnancy	1647

Data elements (continued)

Tobacco smoking indicator, first 20 weeks of pregnancy	1649
Tobacco smoking status	1651
Tobacco smoking status (diabetes mellitus).....	1654
Tobacco smoking – consumption/quantity (cigarettes)	1656
Tobacco smoking – duration (daily smoking)	1658
Tobacco smoking – ever daily use.....	1660
Tobacco smoking – frequency.....	1662
Tobacco smoking – product	1664
Tobacco smoking – quit age (daily smoking)	1666
Tobacco smoking – start age (daily smoking).....	1668
Tobacco smoking – time since quitting (daily smoking).....	1670
Total blood units transfused.....	1672
Total contract patient days	1673
Total leave days.....	1674
Total psychiatric care days	1677
Treatment delivery setting for alcohol and other drugs	1681
Triage category.....	1683
Triglyceride level (measured)	1685
Troponin assay type	1687
Troponin assay – upper limit of normal range (micrograms per litre)	1688
Troponin level (measured)	1689
Tumour size at diagnosis (solid tumours).....	1691
Tumour thickness at diagnosis (melanoma)	1694
Type of accommodation	1695
Type of augmentation of labour	1698
Type of health or health related function	1700
Type of labour induction	1712
Type of usual accommodation.....	1713
Type of visit to emergency department.....	1715
Underlying cause of death.....	1717
Urgency of admission	1719
Vascular history	1723
Vascular procedures.....	1725
Ventricular ejection fraction measurement indicator	1727
Ventricular ejection fraction test result (percentage)	1728
Ventricular ejection fraction test result (code)	1729
Ventricular ejection fraction test type	1731
Visa type – health professional	1732
Visual acuity (left eye).....	1734

Data elements (continued)

Visual acuity (right eye).....	1736
Waist circumference (measured)	1738
Waist circumference risk indicator – adults.....	1742
Waist-to-hip ratio.....	1744
Waiting list category.....	1747
Waiting time at a census date.....	1752
Waiting time at removal from elective surgery waiting list	1755
Weight (self-reported).....	1758
Weight in grams (measured).....	1761
Weight in kilograms (measured)	1763
Work sector – health professional	1767
Work setting – chiropractor.....	1770
Work setting – dental	1773
Work setting – medical practitioner.....	1776
Work setting – midwife.....	1779
Work setting – nurse	1781
Work setting – optometrist.....	1785
Work setting – osteopath.....	1788
Work setting – pharmacist.....	1791
Work setting – physiotherapist.....	1794
Work setting – podiatrist	1797
Work setting – psychologist	1800
Work setting – registered health professional	1803
Working partnership indicator	1806
Year insulin started.....	1808
Year of arrival in Australia	1809
Year of diagnosis of diabetes mellitus	1811

Summary of updates to the *National health data dictionary (NHDD)* since version 14

This section summarises the updates made to the *National health data dictionary* (NHDD) version 15, published in August 2010. This reflects changes to national health data standards between July 2008 and June 2010. During this time, 13 data set specifications, 33 data clusters, 122 data elements, 1 classification scheme and 1 glossary item have been added to the NHDD. Other changes include the revision of 20 national minimum data sets, 8 data set specifications, 6 data clusters, 84 data elements, 7 classification schemes and 1 glossary item. As a result of these revisions, 86 data elements, 20 national minimum data sets, 8 data set specifications, 6 data element clusters, 7 classifications and 1 glossary item have been superseded. No national standards have been retired since version 14 of the NHDD was published.

These new standards have been agreed and endorsed by the members of the National Health Information Standards and Statistics Committee (NHISSC) and the National Electronic Health Information Principal Committee (NEHIPC).

Table 1: Summary table of updates to the NHDD since version 14

Registration status	National minimum data sets	Data set specifications	Data clusters	Data elements	Classifications	Glossary items
Standards (new)	Nil	13	33	122	1	1
Standards (revised)	20	8	6	84	7	1
Superseded	20	8	6	86	7	1
Retired	Nil	Nil	Nil	Nil	Nil	Nil

Table 2: Revised national minimum data sets

National minimum data set	Description of change	Data elements revised	Data elements added	Data elements removed
Admitted patient care NMDS 2009–2010	Revision of two data elements due to version change of related classifications	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Admitted patient care NMDS 2010–2011	Revision of seven data elements due to version change of related classifications	Activity when injured Additional diagnosis Area of usual residence External cause (admitted patient) Place of occurrence of external cause of injury (ICD-10-AM) Principal diagnosis Procedure	Nil	Nil

(continued)

Table 2 (continued): Revised national minimum data sets

National minimum data set	Description of change	Data elements revised	Data elements added	Data elements removed
Admitted patient mental health care NMDS 2009–2010	Revision of two data elements due to version change of related classifications	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Admitted patient mental health care NMDS 2010–2011	Revision of data elements due to version change of related classifications	Additional diagnosis Area of usual residence Diagnosis related group Major diagnostic category Principal diagnosis	Nil	Nil
Admitted patient palliative care NMDS 2009–2010	Revision of two data elements due to version change of related classifications	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Admitted patient palliative care NMDS 2010–11	Revision of three data elements due to version change of related classifications	Additional diagnosis Area of usual residence Principal diagnosis	Nil	Nil
Alcohol and other drug treatment services NMDS 2010–2011	Revision of two data elements due to version change of related classification	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Community mental health care NMDS 2009–2010	Revision of two data elements due to version change of related classification	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Community mental health care NMDS 2010–2011	Revision of two data elements due to version change of related classifications	Area of usual residence Principal diagnosis	Nil	Nil
Elective surgery waiting times (census data) NMDS 2009–	Addition of one data element	Nil	Indigenous status	Nil
Elective surgery waiting times (removals data) NMDS 2009–	Addition of one data element	Nil	Indigenous status	Nil
Government health expenditure NMDS 2009–2010	Revised scope statement which provides information about the purpose of the NMDS Data cluster separated into three component data clusters Revision of two data elements	Capital consumption expenses Health industry relevant organisation type	Nil	Nil

(continued)

Table 2 (continued): Revised national minimum data sets

National minimum data set	Description of change	Data elements revised	Data elements added	Data elements removed
Mental health establishments NMDS 2009–2010	Addition of two data elements	Nil	Average available beds for overnight-stay patients Average available beds for residential mental health patients	Nil
Mental health establishments NMDS 2010–2011	Revision of one data element due to version change of related classification	Geographical location of establishment	Nil	Nil
Non-admitted patient emergency department care NMDS 2010–2011	Revision of four data elements to clarify time spent in the emergency department. Revision of two data elements due to a version change of related classifications	Area of usual residence Country of birth (SACC 2008) Emergency department date of commencement of service event Emergency department time of commencement of service event Emergency department waiting time to service delivery Triage category	Nil	Nil
Perinatal NMDS 2010–2011	Addition of four data elements. Revision of two data elements due to a version change of related classifications	Area of usual residence Country of birth (SACC 2008)	Number of tobacco cigarettes smoked per day, first 20 weeks of pregnancy Pregnancy duration at the first antenatal care visit Tobacco smoking indicator, after 20 weeks of pregnancy Tobacco smoking indicator, first 20 weeks of pregnancy	Nil
Public hospital establishments NMDS 2009–2010	One data element replaced by two new data elements	Nil	Average available beds for overnight-stay patients Average available beds for same-day patients	Number of available beds for admitted patients
Public hospital establishments NMDS 2010–2011	Revision of one data element due to version change of related classification	Geographical location of establishment	Nil	Nil

(continued)

Table 2 (continued): Revised national minimum data sets

National minimum data set	Description of change	Data elements revised	Data elements added	Data elements removed
Residential mental health care NMDS 2009–2010	Revision of two data elements due to version change of related classifications	Area of usual residence Country of birth (SACC 2008)	Nil	Nil
Residential mental health care NMDS 2010–2011	Revision of three data elements due to version change of related classifications	Additional diagnosis Area of usual residence Principal diagnosis	Nil	Nil

Table 3: Revised data set specifications

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
Acute coronary syndrome (clinical) DSS	Revised scope statement clarifying the data collection timeframe of the data set Revisions to 29 data elements, 70 new data elements	ECG – change location ECG – change type ECG – heart rhythm type Functional stress ischaemic and perfusion outcome result Laboratory standard – upper limit of normal range for creatine kinase myocardial band isoenzyme, total micrograms per litre Laboratory standard – upper limit of normal range for creatine kinase myocardial band isoenzyme, total units per litre Laboratory standard – upper limit of normal range for troponin assay, total micrograms per litre Person – acute coronary syndrome procedure type Person – acute coronary syndrome related medical history Person – acute coronary syndrome risk stratum Person – bleeding episode status Person – chest pain pattern Person – cholesterol level (measured)	ECG – Bundle-branch block status ECG – lead V4R presence indicator ECG – new Q waves indicator ECG – ST-segment-elevation in lead V4R indicator ECG time Electrocardiogram (ECG) date Isoenzyme, total units per litre Laboratory standard – upper limit of normal range for creatine kinase Person – acute coronary syndrome symptoms onset date Person – acute coronary syndrome symptoms onset time Person with ACS – instrumented bleeding location Person with ACS – acute coronary syndrome related clinical event time Person with ACS – lifestyle counselling type Person with ACS – non instrumented bleeding location Person with ACS – other cause of acute coronary syndrome	Nil

(continued)

Table 3 (continued): Revised data set specifications

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
		<p>Person – clinical evidence status (acute coronary syndrome related medical history)</p> <p>Person – clinical procedure timing</p> <p>Person – creatine kinase myocardial band isoenzyme level (measured), total micrograms per litre</p> <p>Person – creatine kinase myocardial band isoenzyme level (measured), total units per litre</p> <p>Person – creatinine serum level, micromoles per litre</p> <p>Person – fibrinolytic drug administered Person – intravenous fibrinolytic therapy date</p> <p>Person – intravenous fibrinolytic therapy time</p> <p>Person – low-density lipoprotein cholesterol level (calculated)</p> <p>Person – primary percutaneous coronary intervention date</p> <p>Person – primary percutaneous coronary intervention time</p> <p>Person – reason for readmission following acute coronary syndrome episode</p> <p>Person – triglyceride level (measured)</p> <p>Person – troponin assay type</p> <p>Person – troponin level (measured), total micrograms per litre</p> <p>Stress test element</p>	<p>Person with ACS – pharmacotherapy type prescribed (in hospital)</p> <p>Person with ACS – pharmacotherapy type taken post discharge from hospital</p> <p>Person with ACS – type of acute coronary syndrome related clinical event experienced</p> <p>Person with acute coronary syndrome (ACS) – acute coronary syndrome related clinical event date</p> <p>Stress test – assessment of cardiac perfusion</p> <p>Stress test date</p> <p>Stress test intensity</p>

Table 3 (continued): Revised data set specifications

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
Cancer (clinical) DSS (Version Standard from 22/12/2009)	Revision of 3 data elements due to version change of related classification.	Number of regional lymph nodes examined Oestrogen receptor assay result Primary site of cancer (ICDO-3 code) Regional lymph nodes positive Tumour size at diagnosis (solid tumours) Cancer treatment—target site (ICD-10-AM) Primary site of cancer (ICD-10-AM code) Surgical treatment procedure for cancer	Nil	Nil
Cardiovascular disease (clinical) DSS	Revision of one data element due to version change of related classification.	Country of birth (SACC 2008)	Nil	Nil
Health care client identification DSS	Revision of one data element due to version change of related classification.	Country of birth (SACC 2008)	Nil	Nil
Health care provider identification DSS	Revision of one data element due to version change of a related classification	Country of birth (SACC 2008)	Nil	Nil
Computer Assisted Telephone Interview demographic module DSS	Revision of one data element due to version change of related classification.	Country of birth (SACC 2008)	Nil	Nil
Injury surveillance DSS	Revision of three data elements due to version change of related classifications.	Activity when injured External cause (admitted patient) Place of occurrence of external cause of injury (ICD-10-AM)	Nil	Nil

Table 4: New data set specifications

Name	Description
Breast cancer (cancer registries) DSS	The breast cancer data set enables common, consistent and high-quality breast cancer data to be collected by state and territory cancer registries and collated nationally. This data will help inform research, policy, planning and guideline development work in the breast cancer area.
Registered chiropractic labour force DSS	All chiropractors listed with the Australian Health Practitioner Regulation Agency during the reference period. Chiropractors included in this DSS may be currently registered or they may be listed but not currently registered.
Registered dental and allied dental health professional labour force DSS	All dental and allied dental health professionals listed with the Australian Health Practitioner Regulation Agency during the reference period. Dental and allied dental health professionals included in this DSS may be currently registered or they may be listed but not currently registered.
Registered health labour force DSS	All health professionals listed with the Australian Health Practitioner Regulation Agency during the reference period. This encompasses health professions that require registration under the National Registration and Accreditation Scheme. All health professionals listed with the Australian Health Practitioner Regulation Agency during the reference period. This encompasses health professions that require registration under the National Registration and Accreditation Scheme.
Registered medical professional labour force DSS	All medical professionals listed with the Australian Health Practitioner Regulation Agency during the reference period, including: <ul style="list-style-type: none"> • medical practitioners • medical specialists • medical specialists-in-training. Medical professionals included in this DSS may be currently registered or they may be listed but not currently registered.
Registered midwifery labour force DSS	All midwives listed with the Australian Health Practitioner Regulation Agency during the reference period. Midwives included in this DSS may be currently registered or they may be listed but not currently registered.
Registered nursing professional labour force DSS	All nursing professionals listed with the Australian Health Practitioner Regulation Agency during the reference period, including: <ul style="list-style-type: none"> • enrolled nurses • registered nurses • nurse practitioners. Nursing professionals included in this DSS may be currently registered or they may be listed but not currently registered.
Registered optometry labour force DSS	All optometrists listed with the Australian Health Practitioner Regulation Agency during the reference period. Optometrists included in this DSS may be currently registered or they may be listed but not currently registered.
Registered osteopathy labour force DSS	All osteopaths listed with the Australian Health Practitioner Regulation Agency during the reference period. Osteopaths included in this DSS may be currently registered or they may be listed but not currently registered.
Registered pharmacy labour force DSS	All pharmacists listed with the Australian Health Practitioner Regulation Agency during the reference period. Pharmacists included in this DSS may be currently registered or they may be listed but not currently registered.
Registered physiotherapy labour force DSS	All physiotherapists listed with the Australian Health Practitioner Regulation Agency during the reference period. Physiotherapists included in this DSS may be currently registered or they may be listed but not currently registered.
Registered podiatry labour force DSS	All podiatrists listed with the Australian Health Practitioner Regulation Agency during the reference period. Podiatrists included in this DSS may be currently registered or they may be listed but not currently registered.
Registered psychology labour force DSS	All psychologists listed with the Australian Health Practitioner Regulation Agency during the reference period. Psychologists included in this DSS may be currently registered or they may be listed but not currently registered.

Table 5: New data clusters

Name	Description
Acute coronary syndrome clinical event cluster	The acute coronary syndrome (ACS) related clinical events are those which can negatively impact on the outcomes of a person with ACS. Information on the occurrence of these events in people with ACS is required due to an emerging appreciation of their relationship with late mortality. The clinical event cluster collects information on the timing and type of clinical events experienced during the current hospitalisation.
Acute coronary syndrome pharmacotherapy data cluster	<p>The pharmacotherapies collected in this data cluster are recommended for the management of acute coronary syndromes (ACS) in the national guidelines. The following pharmacotherapies are collected as part of this data cluster:</p> <p>Aspirin</p> <p>Angiotensin converting enzyme (ACE) inhibitor</p> <p>Angiotensin II receptor blocker</p> <p>Antithrombin</p> <p>Beta-blocker</p> <p>Clopidogrel</p> <p>Fibrinolytic</p> <p>Glycoprotein IIb/IIIa receptor antagonist</p> <p>Statin</p> <p>The pharmacotherapy cluster collects information on the type of pharmacotherapies prescribed and the timing of each prescription.</p>
Coronary artery cluster	<p>This cluster collects information on the characteristics of and interventions performed for the coronary arteries during the current hospitalisation. The coronary arteries included in this cluster are:</p> <p>Left anterior descending coronary artery</p> <p>Inferior surface artery</p> <p>Left circumflex coronary artery</p> <p>Diagonal coronary artery</p> <p>Left main coronary artery</p> <p>Posterior descending artery</p> <p>Right coronary artery</p>
Electrocardiogram cluster	<p>An electrocardiogram (ECG) measures the electrical activity of the heart over time. The evaluation of an ECG provides important diagnostic information relevant to the risk stratification, diagnosis and management of acute coronary syndromes. The electrocardiogram cluster collects information on the timing of each ECG and specific diagnostic characteristics determined from the ECG:</p> <ul style="list-style-type: none"> • ECG change type and location • Bundle-branch block status • Q waves status • ST-segment elevation in lead V4R
Functional stress test cluster	A functional stress test evaluates arterial blood flow to the heart muscle during increased cardiac work through physical exercise or pharmacological methods. The functional stress test cluster collects information on the timing, characteristics and results of a functional stress test performed during the current hospital presentation.
Government health expenditure organisation expenditure capital consumption data element cluster	The scope of this data cluster is direct government and government-funded expenditure by a health industry relevant organisation consisting of consumption of fixed capital (depreciation). These are all either health and health-related goods and services or non-health care goods and services to support the health industry relevant organisation's activities.

(continued)

Table 5 (continued): New data clusters

Name	Description
Government health expenditure organisation expenditure employee related data element cluster	The scope of this data cluster is direct government and government-funded expenditure by a health industry relevant organisation consisting mainly of wages, salaries and supplements, superannuation employer contributions, and workers compensation premiums and payouts. These are all either health and health-related goods and services or non-health care goods and services to support the health industry relevant organisation's activities.
Government health expenditure organisation expenditure purchase of goods and services data element cluster	The scope of this data cluster is direct government and government-funded expenditure by a health industry relevant organisation consisting mainly of purchases of goods and services. These are all either health and health-related goods and services or non-health care goods and services to support the health industry relevant organisation's activities.
Labour force status cluster	All health professionals renewing their registration with the Australian Health Practitioner Regulation Agency.
Main job of registered chiropractor cluster	The main job of registered chiropractors who were employed in the profession during the reference week. The main job is defined as the post or position, funded by an organisation, in which the health professional worked the most hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.
Main job of registered dental and allied dental health professional cluster	The main job of registered dental and allied dental health professionals who were employed in the profession during the reference week.
Main job of registered medical professional cluster	The main job of registered medical professionals who were employed in the profession during the reference week.
Main job of registered midwife cluster	The main job of registered midwives who were employed in the profession during the reference week.
Main job of registered nursing professional cluster	The main job of registered nursing professionals who were employed in the profession during the reference week.
Main job of registered optometrist cluster	The main job of registered optometrists who were employed in the profession during the reference week.
Main job of registered osteopath cluster	The main job of registered osteopaths who were employed in the profession during the reference week.
Main job of registered pharmacist cluster	The main job of registered pharmacists who were employed in the profession during the reference week.
Main job of registered physiotherapist cluster	The main job of registered physiotherapists who were employed in the profession during the reference week.
Main job of registered podiatrist cluster	The main job of registered podiatrists who were employed in the profession during the reference week.
Main job of registered psychologist cluster	The main job of registered psychologists who were employed in the profession during the reference week.
Second job of registered chiropractor cluster	The second job of registered chiropractors who were employed in more than one job in the profession during the reference week. The second job is defined as the post or position, funded by an organisation, in which the health professional worked the second longest hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.
Second job of registered dental and allied dental health professional cluster	The second job of registered dental and allied dental health professionals who were employed in more than one job in the profession during the reference week.
Second job of registered medical professional cluster	The second job of registered medical professionals who were employed in more than one job in the profession during the reference week.

(continued)

Table 5 (continued): New data clusters

Name	Description
Second job of registered midwife cluster	The second job of registered midwives who were employed in more than one job in the profession during the reference week.
Second job of registered nursing professional cluster	The second job of registered nursing professionals who were employed in more than one job in the profession during the reference week.
Second job of registered optometrist cluster	The second job of registered optometrists who were employed in more than one job in the profession during the reference week.
Second job of registered osteopath cluster	The second job of registered osteopaths who were employed in more than one job in the profession during the reference week.
Second job of registered pharmacist cluster	The second job of registered pharmacists who were employed in more than one job in the profession during the reference week.
Second job of registered physiotherapist cluster	The second job of registered physiotherapists who were employed in more than one job in the profession during the reference week.
Second job of registered podiatrist cluster	The second job of registered podiatrists who were employed in more than one job in the profession during the reference week.
Second job of registered psychologist cluster	The second job of registered psychologists who were employed in more than one job in the profession during the reference week.
Ventricular ejection fraction cluster	The ventricular ejection fraction is the fraction of blood pumped out of a ventricle with each heart beat. Impaired ventricular ejection fraction can be indicative of damage to the heart muscle, such as that sustained during myocardial infarction. The ventricular ejection fraction cluster collects information on the timing, measurement type and results of a ventricular ejection fraction measurement during the current hospital presentation.
Work setting hours cluster	Registered health professionals listed with the Australian Health Practitioner Regulation Agency who were employed in the profession during the reference week. They may be an employee or they may be self-employed.

Table 6: Revised data clusters

Data cluster	Description of change	Data elements revised	Data elements added	Data elements removed
Government health expenditure organisation expenditure capital consumption data element cluster	Revision of two data elements. One revision due to the revision of the data element concept name, and the second due to an addition of a permissible value.	Capital consumption expenses Health industry relevant organisation type	Nil	Nil
Government health expenditure organisation expenditure data element cluster	Revision of two data elements. One revision due to the revision of the data element concept name, and the second due to an addition of a permissible value.	Capital consumption expenses Health industry relevant organisation type	Nil	Nil
Government health expenditure organisation expenditure employee related data element cluster	Revision of one data element, due to the addition of a new permissible value.	Health industry relevant organisation type	Nil	Nil

(continued)

Table 6 (continued): Revised data clusters

Data cluster	Description of change	Data elements revised	Data elements added	Data elements removed
Government health expenditure organisation expenditure purchase of goods and services data	Revision of one data element, due to the addition of a new permissible value.	Health industry relevant organisation type	Nil	Nil
Government health expenditure organisation revenue data element cluster	Revision of one data element, due to the addition of a new permissible value. Addition of information to the collection methods.	Health industry relevant organisation type	Nil	Nil
Government health expenditure organisation function revenue data element cluster	Scope statement added, conditionality updated to mandatory	Nil	Nil	Nil

Table 7: Revised data elements

Short name	Technical name	Description of change
Activity when injured	Injury event—activity type, code (ICD-10-AM 7th edn) ANNNN	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Acute coronary syndrome procedure type	Person—acute coronary syndrome procedure type, code NN	Additional information added to Collection methods and Guide for use regarding timing of ACS procedures.
Acute coronary syndrome related medical history	Person—acute coronary syndrome related medical history, code NN	Definition revised for clarification. Collection methods revised to clarify use of supporting data elements. Insertion of new references.
Acute coronary syndrome stratum	Person—acute coronary syndrome risk stratum, code N	Definition revised for clarification. Guide for use includes additional information for ACS symptoms. Comments provide rationale for collection.
Additional diagnosis	Episode of care—additional diagnosis, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Address—country identifier (person)	Person (address)—country identifier, code (SACC 2008) NNNN	Revisions are a result of the release of the Standard Australian Classification of Countries 2008.
Area of practice – dental	Registered health professional—principal area of practice, dental code NN	The former data element was revised and replaced with four specific and targeted data elements based on the previous permissible values.
Area of practice – midwifery	Registered health professional—principal area of practice, midwifery code NN	The former data element was revised and replaced with four specific and targeted data elements based on the previous permissible values.
Area of practice – nursing	Registered health professional—principal area of practice, nursing code NN	The former data element was revised and replaced with four specific and targeted data elements based on the previous permissible values.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Area of practice – psychology	Registered health professional—principal area of practice, psychology code NN	The former data element was revised and replaced with four specific and targeted data elements based on the previous permissible values
Area of usual residence	Person—area of usual residence, geographical location code (ASGC 2008) NNNNN	Value domain uses updated ASGC 2008 classification.
Area of usual residence	Person—area of usual residence, geographical location code (ASGC 2009) NNNNN	Revisions are a result of the release of the ASGC 2009.
Available bed—overnight-stay admitted care, average number of beds N[NNN.N]	Average available beds for overnight-stay patients	Value domain has been revised to 5 numeric characters in length. The object class has been revised to reference available beds and the property revised to clearly reflect the scope as overnight-stay patients.
Bleeding episode using TIMI criteria (status)	Person—bleeding episode status, Thrombolysis in Myocardial Infraction (TIMI) code N	Data element now uses specific TIMI value domain. Value domain Guide for use clarifies acceptable ranges for bleeding episodes.
Cancer staging—M stage code	Person with cancer—distant metastasis status, M stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX	Value domain updated to 6 th edition of UICC TNM Classification of Malignant Tumours. Guide for use updated to clarify that TNM staging applies to solid tumours, excluding brain tumours.
Cancer staging—N stage code	Person with cancer—regional lymph node metastasis status, N stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX	Value domain updated to 6 th edition of UICC TNM Classification of Malignant Tumours. Guide for use updated to clarify that TNM staging applies to solid tumours, excluding brain tumours.
Cancer staging—T stage code	Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XX[X]	Value domain updated to 6 th edition of UICC TNM Classification of Malignant Tumours. Guide for use updated to clarify that TNM staging applies to solid tumours, excluding brain tumours.
Cancer staging—TNM stage grouping code	Person with cancer—extent of primary cancer, TNM stage (UICC TNM Classification of Malignant Tumours, 6th ed) code XXXX{[X]XX}	Value domain updated to 6 th edition of UICC TNM Classification of Malignant Tumours. Guide for use updated to clarify that TNM staging applies to solid tumours, excluding brain tumours.
Cancer treatment—target site (ICD-10-AM)	Cancer treatment—target site for cancer treatment, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Capital consumption expenses	Organisation—capital consumption expenses, total Australian currency NNNNN.N	Property changed from Depreciation expenses for consistency with definition, therefore changing the data element concept and data element.
Chest pain pattern category	Person—chest pain pattern, code N	Value domain Guide for use expanded to provide additional information about chest pain.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Cholesterol—LDL (calculated)	Person—low-density lipoprotein cholesterol level (calculated), total millimoles per litre N[N].N	Definition revised for clarification. Collection methods updated to reflect changes in clinical practice. Origin for information included.
Cholesterol—total (measured)	Person—cholesterol level (measured), total millimoles per litre N[N].N	Definition revised for clarification. Comments and references updated.
Clinical evidence of acute coronary syndrome related medical history	Person—clinical evidence status (acute coronary syndrome related medical history), yes/no code N	Five separate data elements for clinical evidence status consolidated into one data element.
Clinical procedure timing (status)	Person—clinical procedure timing, code N	Value domain modified to refer to a clinical procedure relating to the current hospital presentation, rather than an episode of admitted patient care.
Complication of labour and delivery	Birth event—complication, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Complications of pregnancy	Pregnancy (current)—complication, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Congenital malformations	Person—congenital malformation, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Country of birth	Person—country of birth, code (SACC 2008) NNNN	Revisions are a result of the release of the Standard Australian Classification of Countries 2008.
Creatine kinase MB isoenzyme level (micrograms per litre)	Person—creatinine kinase-myocardial band isoenzyme level (measured), total micrograms per litre N[NNN]	Guide for use modified to refer to hospital presentation rather than admission. Change to supplementary codes in value domain.
Creatine kinase MB isoenzyme level (units per litre)	Person—creatinine kinase-myocardial band isoenzyme level (measured), total units per litre N[NNN]	Value domain name changed to reflect appropriate unit of measurement – previously international units. Guide for use modified to refer to hospital presentation rather than admission. Change to supplementary codes in value domain.
Creatine kinase MB isoenzyme—upper limit of normal range (units per litre)	Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total units per litre N[NNN]	Value domain name changed to reflect appropriate unit of measurement – previously international units.
Creatine kinase MB isoenzyme—upper limit of normal range (micrograms per litre)	Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total micrograms per litre N[NNN]	Correction to definition.
Creatinine serum level (measured)	Person—creatinine serum level, total micromoles per litre NN[NN]	Data element name and definition revised for clarification. Additional information added to comments.
Date of intravenous fibrinolytic therapy	Person—intravenous fibrinolytic therapy date, DDMMYYYY	Definition revised for clarification.
Date of primary percutaneous coronary intervention	Person—primary percutaneous coronary intervention date, DDMMYYYY	Name and definition changed to reflect Percutaneous coronary intervention date rather than first angioplasty balloon inflation or stenting date. Guide for use provides information about PCI.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Diagnosis related group	Episode of admitted patient care—diagnosis related group, code (AR-DRG v 6) ANNA	Revisions are a result of agreement to collect version 6 of the Australian Refined Diagnosis Related Groups (AR-DRG v 6).
Electrocardiogram change location	Electrocardiogram—change location, code N	Definition no longer specifies a 12 point ECG. Guide for use revised for clarity.
Electrocardiogram change type	Electrocardiogram—change type, code N	Object class changed. Collection methods contain additional information. Value domain codes have been changed to double digits.
Emergency department date of commencement of service event	Non-admitted patient emergency department service episode—service commencement date, DDMMYYYY	Revised to ensure greater consistency of collection and reporting.
Emergency department time of commencement of service event	Non-admitted patient emergency department service episode—service commencement time, hhmm	Revised to ensure greater consistency of collection and reporting.
Emergency department waiting time to service delivery	Non-admitted patient emergency department service episode—waiting time (to service delivery), total minutes NNNNN	Revised to ensure greater consistency of collection and reporting.
Employment status - health professional	Registered health professional—labour force status, registered health professional code N	Data element updated to refer to registered health professionals. Permissible values condensed.
External cause (admitted patient)	Injury event—external cause, code (ICD-10-AM 7th edn) ANN{N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Fibrinolytic drug used	Person—fibrinolytic drug administered, code N	Definition revised for clarification.
Functional stress ischaemic and perfusion outcome result	Functional stress test—iskaemic and perfusion outcome result, code N	Object class changed. Definition changed to include perfusion outcome. New value domain used.
Functional stress test element	Functional stress test—stress test element, code N	Object class changed. Definition revised for clarification.
Geographical location of establishment	Establishment—geographical location, code (ASGC 2009) NNNNN	Revisions are a result of the 2009 release of the Australian Standard Geographical Classification (ASGC 2009).
Geographical location of establishment	Establishment—geographical location, code (ASGC 2008) NNNNN	Value domain uses updated ASGC 2008 classification.
Geographical location of service delivery outlet	Service delivery outlet—geographic location, code (ASGC 2008) NNNNN	Value domain uses updated ASGC 2008 classification.
Geographical location of service delivery outlet	Service delivery outlet—geographic location, code (ASGC 2009) NNNNN	Revisions are a result of the release of the ASGC 2009.
Gestational age	Product of conception—gestational age, completed weeks N[N]	Revised to clarify the existing definition.
Health industry relevant organisation type	Health industry relevant organisation—main activity type, code NNN	Addition of category '204 Residential age care' to value domain and associated guide for use changes.
Heart rhythm type	Electrocardiogram—heart rhythm type, code N[N]	Object class changed.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Histopathological grade	Person with cancer—histopathological grade, code N	Revision to definition for clarity. Guide for use expanded to clarify coding rules including breast cancer. Collection methods updated to provide information about cancer registries.
Hours worked in health profession - clinical	Registered health professional—hours worked in clinical role, total hours NNN	Data element scope has been generalised to apply to all registered health professional, rather than simply medical practitioners. As a result the object class, property and data element concept have been changed
Hours worked in health profession - total	Registered health professional—hours worked in health profession, total hours NNN	Revision has consolidated two data elements into one data element. The scope has been generalised to capture all registered health professionals.
Major diagnostic category	Episode of admitted patient care—major diagnostic category, code (AR-DRG v 6) NN	Revisions are a result of agreement to collect AR-DRG v 6.
Maternal medical conditions	Female (pregnant)—maternal medical condition, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Morphology of cancer	Person with cancer—morphology of cancer, code (ICDO-3) NNNN/N	Collection methods updated to provide more comprehensive information for cancer registries.
Neonatal morbidity	Admitted patient (neonate)—neonatal morbidity, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition (ICD-10-AM-7 th edition).
Number of regional lymph nodes examined	Person with cancer—number of regional lymph nodes examined, total code N[N]	Additional information added to the Guide for use, including a reference to TNM Classification of Tumours, 6th Edition.
Oestrogen receptor assay result	Person with cancer—oestrogen receptor assay result, code N	Information about coding rules added to Guide for use. Collection methods updated to provide information about cancer registries. Additional information added to value domain clarifying use of supplementary codes.
Place of occurrence of external cause of injury (ICD-10-AM)	Injury event—place of occurrence, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Postpartum complication	Birth event—complication (postpartum), code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Primary site of cancer (ICD-10-AM code)	Person with cancer—primary site of cancer, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.
Primary site of cancer (ICDO-3 code)	Person with cancer—primary site of cancer, code (ICDO-3) ANN{.N[N]}	Information about cancer registries and coding rules added to Guide for use.
Principal diagnosis	Episode of care—principal diagnosis, code (ICD-10-AM 7th edn) ANN{.N[N]}	Revisions are a result of the release of the ICD-10-AM-7 th edition.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Principal role – health profession	Registered health professional—principal role, health profession code N	The definition has been revised. The value domain has been revised to condense three permissible values into an 'other' category. The object class has also been revised to clarify it refers to registered health professionals only
Procedure	Episode of admitted patient care—procedure, code (ACHI 7th edn) NNNNN-NN	Revisions are a result of the release of the ACHI 7 th edition.
Reason for readmission—acute coronary syndrome	Person—reason for readmission following acute coronary syndrome episode, code N[N]	Guide for use revised to clarify conditions under which this data element should be collected i.e. if they have been discharged from an episode of admitted patient care for acute coronary syndrome within the last 28 days.
Recurrent expenditure—Department of Veterans' Affairs funded	Establishment—recurrent expenditure (Department of Veterans' Affairs funded), total Australian currency N[N(8)]	Revised to clarify the existing definition and remove perceived ambiguities.
Regional lymph nodes positive	Person with cancer—number of positive regional lymph nodes, total N[N]	Additional information added to the Guide for use, including a reference to TNM Classification of Tumours, 6th Edition. Data element now using a generic value domain which is reused across a number of cancer data elements.
Specialised mental health service—supported public housing places	Specialised mental health service—number of supported public housing places, total N[N(5)]	Revised to clarify the existing definition and remove perceived ambiguities.
Surgical treatment procedure for cancer	Cancer treatment—surgical procedure for cancer, procedure code (ACHI 7th edn) NNNNN-NN	Revisions are a result of the release of the Australian Classification of Health Interventions (ACHI) 7 th edition.
Time of intravenous fibrinolytic therapy	Person—intravenous fibrinolytic therapy time, hhmm	Additional information added to comments.
Time of primary percutaneous coronary intervention	Person—primary percutaneous coronary intervention time, hhmm	Name and definition changed to reflect Percutaneous coronary intervention time rather than first angioplasty balloon inflation or stenting time. Guide for use provides information about PCI.
Triage category	Non-admitted patient emergency department service episode—triage category, code N	Revised to ensure greater consistency of collection and reporting.
Triglyceride level (measured)	Person—triglyceride level (measured), total millimoles per litre N[N].N	Collection methods modified to reflect that new information relating to the calculation of the low-density lipoprotein - cholesterol (LDL-C).
Troponin assay type	Person—troponin assay type, code N	Value domain revised: permissible value '3 Not taken' has been removed.
Troponin assay—upper limit of normal range (micrograms per litre)	Laboratory standard—upper limit of normal range for troponin assay, total micrograms per litre N[NNN]	Correction of grammatical error in definition.
Troponin level (measured)	Person—troponin level (measured), total micrograms per litre NN.NN	Guide for use revised to remove reference to the admission, and correction of typographical error.

(continued)

Table 7 (continued): Revised data elements

Short name	Technical name	Description of change
Tumour size at diagnosis (solid tumours)	Person with cancer—solid tumour size (at diagnosis), total millimetres NNN	Guide for use expanded to include detailed information about reporting standards and coding rules.
Work setting – registered health professional	Registered health professional—work setting, code ANN	The definition, object class and value domain have been revised to reflect the work setting of a registered health professional. The property has been revised to change the scope to work setting

Table 8: New data elements

Short name	Technical name
Acute coronary syndrome related clinical event type	Person with acute coronary syndrome—type of acute coronary syndrome related clinical event experienced, code N[N]
Angina status	Person—angina status, Canadian Cardiovascular Society code N
Area of practice - dental	Registered health professional—principal area of practice, dental code NN
Area of practice - midwifery	Registered health professional—principal area of practice, midwifery code NN
Area of practice - nursing	Registered health professional—principal area of practice, nursing code NN
Area of practice - psychology	Registered health professional—principal area of practice, psychology code NN
Average available beds for hospital-in-the-home patients	Occupied bed—hospital in the home care, average number of beds N[NNN.N]
Average available beds for residential mental health patients	Available bed—residential mental health care, average number of beds N[NNN.N]
Average available beds for same-day patients	Available bed—same-day admitted care, average number of beds N[NNN.N]
Average available neonatal cots (non-special-care)	Available bed—neonatal admitted care (Non-special-care), average number of beds N[NNN.N]
Bundle-branch block status	Electrocardiogram—bundle-branch block status, code N
Coronary artery bypass graft location	Person—coronary artery bypass graft location, code N
Coronary artery stenosis location	Person—coronary artery stenosis location, code N
Country of employment in registered profession	Registered health professional—country of employment in registered profession, Australia/other country code N
C-reactive protein level (measured)	Person—C-reactive protein level (measured), total milligrams per litre N[NN].N
Creatine kinase isoenzyme—upper limit of normal range (U/L)	Laboratory standard—upper limit of normal range for creatine kinase isoenzyme, total units per litre N[NNN]
Creatine kinase level (U/L)	Person—creatinine kinase isoenzyme level (measured), total units per litre N[NNN]
Date C-reactive protein level measured	Person—C-reactive protein level measured date, DDMMYYYY
Date creatinine serum level measured	Person—creatinine serum level measured date, DDMMYYYY

(continued)

Table 8 (continued): New data elements

Short name	Technical name
Date of acute coronary syndrome related clinical event	Person with acute coronary syndrome—acute coronary syndrome related clinical event date, DDMMYYYY
Date of coronary artery bypass graft	Person—coronary artery bypass graft date, DDMMYYYY
Date of diagnostic cardiac catheterisation	Person—diagnostic cardiac catheterisation date, DDMMYYYY
Date of electrocardiogram	Electrocardiogram— electrocardiogram date, DDMMYYYY
Date of functional stress test	Functional stress test—test date, DDMMYYYY
Date of implantable cardiac defibrillator procedure	Person—implantable cardiac defibrillator procedure date, DDMMYYYY
Date of intra-aortic balloon pump procedure	Person—intra-aortic balloon pump procedure date, DDMMYYYY
Date of most recent stroke	Person—most recent stroke date, DDMMYYYY
Date of non-invasive ventilation administration	Person—non-invasive ventilation administration date, DDMMYYYY
Date of onset of acute coronary syndrome symptoms	Person—acute coronary syndrome symptoms onset date, DDMMYYYY
Date of pacemaker insertion	Person—pacemaker insertion date, DDMMYYYY
Date of rescue percutaneous coronary intervention	Person—rescue percutaneous coronary intervention date, DDMMYYYY
Date of revascularisation percutaneous coronary intervention	Person—revascularisation percutaneous coronary intervention date, DDMMYYYY
Date of ventricular ejection fraction test	Ventricular ejection fraction test—test date, DDMMYYYY
ECG - Q waves indicator	Person—electrocardiogram Q waves indicator, yes/no code N
Electrocardiogram - new Q waves indicator	Electrocardiogram—new Q waves indicator, yes/no code N
Electrocardiogram - lead V4R presence indicator	Electrocardiogram—lead V4R presence indicator, yes/no code N
Electrocardiogram - ST-segment-elevation in lead V4R	Electrocardiogram— ST-segment-elevation in lead V4R indicator, yes/no code N
Extended leave status in registered profession	Registered health professional—extended leave status in registered profession, code N
Field of medicine - medical practitioner	Registered health professional—principal field of medicine, medical practitioner code N
Functional stress test assessment of cardiac perfusion	Functional stress test—assessment of cardiac perfusion, code N[N]
Functional stress test intensity	Functional stress test— stress test intensity, code N
Functional stress test performed indicator	Person—functional stress test performed indicator, yes/no code N
Hours worked in health profession - clinical	Registered health professional—hours worked in clinical role, total hours NNN
Hours worked in health profession - non-clinical	Registered health professional—hours worked in non-clinical role, total hours NNN
Hours worked in health profession - private sector	Registered health professional—hours worked in private sector, total hours NNN
Hours worked in health profession - public sector	Registered health professional—hours worked in public sector, total hours NNN
Hours worked in health profession - total	Registered health professional—hours worked in health profession, total hours NNN

(continued)

Table 8 (continued): New data elements

Short name	Technical name
Human epidermal growth factor receptor-2 test result	Person with cancer—human epidermal growth factor receptor-2 test result, code N
Human epidermal growth factor receptor-2 test type	Person with cancer—human epidermal growth factor receptor-2 test type, code N
Instrumented bleeding location	Person with acute coronary syndrome—bleeding location, instrumented code N(N)
Intended years in health profession	Registered health professional—intended years in profession, total years NN
Jobseeker status in registered profession	Registered health professional—jobseeker status in registered profession, code N
Length of employment in health profession	Registered health professional—length of employment in profession in Australia, total years NN
Lifestyle counselling type	Person with acute coronary syndrome—lifestyle counselling type, code N
Lymphovascular invasion	Person with cancer—lymphovascular invasion, code N
Maximum stenosis coronary artery	Person—maximum stenosis coronary artery, percentage N[NN]
Month and year of birth	Person—date of birth, MMYYYY
Neo-adjuvant therapy	Person with cancer—neoadjuvant therapy indicator, code N
Non-instrumented bleeding location	Person with acute coronary syndrome—bleeding location, non-instrumented code N(N)
Number of coronary artery lesions attempted	Person—count of coronary artery lesions attempted, total number N[N]
Number of coronary artery lesions successfully dilated	Person—count of coronary artery lesions successfully dilated, total number N[N]
Number of coronary artery stents	Person—count of coronary artery stents, total number N[N]
Number of episodes of angina in last 24 hours	Person—angina episodes count (24 hours preceding hospital presentation), total number NN[N]
Number of positive sentinel lymph nodes	Person with cancer—number of positive sentinel lymph nodes, total code N[N]
Number of sentinel lymph nodes examined	Person with cancer—number of sentinel lymph nodes examined, total code N[N]
Number of tobacco cigarettes smoked per day after 20 weeks of pregnancy	Female (pregnant)—number of cigarettes smoked (per day after 20 weeks of pregnancy), number N[NN]
Number of tobacco cigarettes smoked per day first 20 weeks of pregnancy	Female (pregnant)—number of cigarettes smoked (per day first 20 weeks of pregnancy), number N[NN]
Other/Underlying cause of acute coronary syndrome	Person with acute coronary syndrome—underlying cause of acute coronary syndrome, code N
Percutaneous coronary intervention procedure type	Person—percutaneous coronary intervention procedure type, code N
Person—Australian state/territory of birth, code N	Person—Australian state/territory of birth, code N
Pharmacotherapy type prescribed for acute coronary syndrome in hospital	Person with acute coronary syndrome—pharmacotherapy type prescribed in hospital, code N[N]
Pharmacotherapy type taken for acute coronary syndrome post discharge	Person with acute coronary syndrome—pharmacotherapy type taken post discharge from hospital, code N[N]
Postcode—Australian workplace	Workplace (address)—Australian postcode, code (Postcode datafile) {NNNN}
Pregnancy duration at the first antenatal care visit	Pregnancy—estimated duration (at the first visit for antenatal care), completed weeks N[N]

(continued)

Table 8 (continued): New data elements

Short name	Technical name
Principal role – health profession	Registered health professional—principal role, health profession code N
Reason for non prescription of pharmacotherapy	Person—reason for non prescription of pharmacotherapy, code N
Residual expenditure (mental health service)—Mental Health Act Regulation or related legislation	Specialised mental health service—residual expenditure (Mental Health Act Regulation or related legislation), total Australian currency N[N(8)]
Residual expenditure (mental health service)—service development	Specialised mental health service—residual expenditure (service development), total Australian currency N[N(8)]
Retirement status in registered profession	Registered health professional—retirement status in registered profession, code N
Suburb/town/locality name (workplace)	Workplace (address)—suburb/town/locality name, text [A(50)]
Time C-reactive protein level measured	Person—C-reactive protein level measured time, hhmm
Time of acute coronary syndrome related clinical event	Person with acute coronary syndrome—acute coronary syndrome related clinical event time, hhmm
Time of diagnostic cardiac catheterisation	Person—diagnostic cardiac catheterisation time, hhmm
Time of electrocardiogram	Electrocardiogram— electrocardiogram time, hhmm
Time of implantable cardiac defibrillator procedure	Person—implantable cardiac defibrillator procedure time, hhmm
Time of intra-aortic balloon pump procedure	Person—intra-aortic balloon pump procedure time, hhmm
Time of non-invasive ventilation administration	Person—non-invasive ventilation administration time, hhmm
Time of onset of acute coronary syndrome symptoms	Person—acute coronary syndrome symptoms onset time, hhmm
Time of pacemaker insertion	Person—pacemaker insertion time, hhmm
Time of rescue percutaneous coronary intervention	Person—rescue percutaneous coronary intervention time, hhmm
Time of revascularisation percutaneous coronary intervention	Person—revascularisation percutaneous coronary intervention time, hhmm
Time of ventricular ejection fraction test	Ventricular ejection fraction test—test time, hhmm
Timing of ACE-inhibitor prescription	Person—timing of ACE-inhibitor prescription, code N
Timing of angiotensin II receptor blocker prescription	Person—timing of angiotensin II receptor blocker prescription, code N
Timing of antithrombin therapy prescription	Person—timing of antithrombin therapy prescription, code N
Timing of aspirin prescription	Person—timing of aspirin prescription, code N
Timing of beta-blocker prescription	Person—timing of beta-blocker prescription, code N
Timing of clopidogrel prescription	Person—timing of clopidogrel prescription, code N
Timing of glycoprotein lib/IIIa inhibitor prescription	Person—timing of glycoprotein lib/IIIa inhibitor prescription, code N
Timing of statin prescription	Person—timing of statin prescription, code N
Tobacco smoking indicator, after 20 weeks of pregnancy	Female (pregnant)—tobacco smoking indicator (after twenty weeks of pregnancy), yes/no code N
Tobacco smoking indicator, first 20 weeks of pregnancy	Female (pregnant)—tobacco smoking indicator (first twenty weeks of pregnancy), yes/no code N
Total blood units transfused	Person—units of blood transfused, total N[NNN]
Underlying cause of death	Person—underlying cause of death, code (ICD-10 2 nd edn) ANN-ANN

(continued)

Table 8 (continued): New data elements

Short name	Technical name
Ventricular ejection fraction measurement indicator	Person—ventricular ejection fraction test performed indicator, yes/no code N
Ventricular ejection fraction test result (percentage)	Ventricular ejection fraction—test result, percentage N[N].N
Ventricular ejection fraction test result (code)	Ventricular ejection fraction—test result, code N
Ventricular ejection fraction test type	Ventricular ejection fraction test—test type, code N
Visa type - health professional	Registered health professional—visa type, code AANNN
Work sector - health professional	Registered health professional—work sector in health profession, code N
Work setting - chiropractor	Registered health professional—work setting, chiropractor code ANN
Work setting - dental	Registered health professional—work setting, dental code ANN
Work setting - medical practitioner	Registered health professional—work setting, medical practitioner code ANN
Work setting - midwife	Registered health professional—work setting, midwife code ANN
Work setting - nurse	Registered health professional—work setting, nurse code ANN
Work setting - optometrist	Registered health professional—work setting, optometrist code ANN
Work setting - osteopath	Registered health professional—work setting, osteopath code ANN
Work setting - pharmacist	Registered health professional—work setting, pharmacist code ANN
Work setting - physiotherapist	Registered health professional—work setting, physiotherapist code ANN
Work setting - podiatrist	Registered health professional—work setting, podiatrist code ANN
Work setting - psychologist	Registered health professional—work setting, psychologist code
Work setting - registered health professional	Registered health professional—work setting, code ANN

Table 9: Revised classification schemes

Name	Description of change
Australian Classification of Health Interventions (ACHI) 7th edition	Revisions are a result of the release of the ACHI 7th edition.
Australian Refined Diagnosis Related Groups version 6	Revisions are a result of agreement to collect AR-DRG v 6.
Australian Standard Geographical Classification 2008	Australian Standard Geographical Classification 2008 replaces Australian Standard Geographical Classification 2007.
Australian Standard Geographical Classification 2009	Revisions are a result of the release of the ASGC 2009.
International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition	Revisions are a result of the release of the ICD-10-AM 7th edition.
International Union against Cancer (UICC) TNM Classification of Malignant Tumours 6th edition	International Union against Cancer (UICC) TNM Classification of Malignant Tumours 6th edition replaces TNM Classification of Malignant Tumours 5th edition.
Standard Australian Classification of Countries 2008.	Standard Australian Classification of Countries 2008 replaces Standard Australian Classification of Countries 1998.

Name	Description
Residential mental health care service	Revised to clarify the existing definition and remove perceived ambiguities.

Table 12: New glossary items

Name
Average for the counting period

National health data dictionary version 15

Data elements

Accrued mental health care days

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment – accrued mental health care days, total N[N(7)]
<i>METeOR identifier:</i>	286770
<i>Registration status:</i>	Health, Standard 08/12/2004
<i>Definition:</i>	The total number of accrued mental health care days provided by admitted patient care services and residential mental health care services within the reference period (from 1 July to 30 June inclusive).
Data Element Concept:	Establishment – accrued mental health care days

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[N(7)]
<i>Maximum character length:</i>	8
<i>Unit of measure:</i>	Day

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The days to be counted are only those days occurring within the reference period, i.e. from 1 July to the following 30 June for the relevant period, even if the patient/resident was admitted prior to the reference period or discharged after the reference period.</p> <p>A day is measured from midnight to 2359 hours.</p> <p>The following basic rules are used to calculate the number of accrued mental health care days:</p> <ul style="list-style-type: none">• Admission and discharge on the same day is equal to one mental health care day.• For a patient/resident admitted and discharged on different days all days are counted as mental health care days, except the day of discharge and any leave days.• If the patient/resident remains in hospital or residential care facility from midnight to 2359 hours count as a mental health care day.• The day a patient/resident goes on leave is not counted as a mental health care day, unless this was also the admission day.
-----------------------	--

- The day the patient/resident returns from leave is counted as a mental health care day, unless the patient/resident goes on leave again on the same day of return or is discharged.
- Leave days involving an overnight absence are not counted as mental health care days.
- If a patient/resident goes on leave the day they are admitted and does not return from leave until the day they are discharged, count as one mental health care day.
- If the patient/resident remains in a hospital or residential care facility from 1 July to 30 June (the whole of the reference period) count as 365 days (or 366 days in a leap year).
- If the patient/resident remains in a hospital or residential care facility after the end of the reference period (i.e. after 30 June) do not count any days after the end of the reference period.

The following additional rules cover special circumstances and in such cases, override the basic rules:

When calculating accrued mental health care days for the reference period:

- Count the mental health care days of those patients/residents separated during the reference period. Exclude any days that may have occurred before the beginning of the reference period.
- Count the mental health care days of those patients/residents admitted during the reference period who did not separate until the following reference period. Exclude the days after the end of the reference period.
- For patients/residents admitted before the reference period and who remain in after the reference period (i.e. after 30 June), count the mental health care days within the reference period only. Exclude all days before and after the reference period.

Examples of mental health care day counting for a reference period 1 July 2004 to 30 June 2005:

Patient/resident A was admitted to hospital on 4 June 2004 and separated on 6 July 2004. If no leave or transfer occurred counting starts on 1 July. Count would be 5 days as day of discharge is not counted.

Patient/resident B was admitted to hospital on 1 August 2004 and separated on 8 August 2004. If no leave or transfer occurred counting starts on 1 August. Count would be 7 days as day of discharge is not counted.

Patient/resident C was admitted to hospital on 1 June 2005 and separated on 6 July 2005. If no leave or transfer occurred counting starts on 1 June. Count would be 30 days as patient/resident was not discharged on 30 June, so every day up to and including 30 June would be counted.

Patient/resident D was admitted to hospital on 1 August 2003 and has remained continuously in hospital to the present time. If no leave or transfer occurred counting starts on 1 July 2004 and concludes on 30 June 2005. Count would be 365 days as there is no day of discharge.

Collection methods:

To be reported for admitted patient care services, including services that are staffed for less than 24 hours, and non-government organisation services where included.

NOTE: These data need to be disaggregated by Specialised mental health service setting (excluding Ambulatory care settings). For admitted patient care settings these counts also need to be disaggregated by Specialised mental health service program type and Specialised mental health service target population.

Activity and participation life area

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – activity and participation life area, code (ICF 2001) AN[NNN]
<i>METeOR identifier:</i>	320125
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The life area in which a person participates or undertakes activities, as represented by a code.
<i>Context:</i>	Human functioning and disability
<i>Data Element Concept:</i>	Person – activity and participation life area

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	AN[NNN]
<i>Maximum character length:</i>	5

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept ‘Disability’ and gives an indication of the experience of disability for a person.</p> <p>The activities and participation codes are a neutral list that covers the full range of life areas in which a person can be involved. The domains can be used to record positive or neutral experience of functioning as well as limitations and restrictions.</p> <p>Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both ‘Self care’ (chapter level) and ‘Looking after one’s health’ (3 digit level) as the former includes the latter.</p> <p>The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with respective qualifiers (Activity difficulty level, Activity Need for assistance, Participation extent and Participation satisfaction level) will use the codes as indicated.</p> <p>CODE d1 Learning and applying knowledge CODE d2 General tasks and demands CODE d3 Communication CODE d4 Mobility</p>
-----------------------	--

CODE d5 Self-care
CODE d6 Domestic life
CODE d7 Interpersonal interactions and relationships
CODE d8 Major life areas
CODE d9 Community, social and civic life

Data collected at this level will provide a general description of functioning for the person and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For specific more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values is listed in the **Activities** and **Participation** component of the ICF.

An example of a value domain at the 3 digit level from the Self-care chapter may include:

CODE d510 Washing oneself
CODE d520 Caring for body parts
CODE d530 Toileting
CODE d540 Dressing
CODE d550 Eating
CODE d560 Drinking
CODE d570 Looking after one's health

An example of value domains at the 4 digit level from the Mobility chapter may include:

CODE d4600 Moving around within the home
CODE d4601 Moving around within buildings other than home
CODE d4602 Moving around outside the home and other buildings
CODE d4701 Using private motorized transportation
CODE d4702 Using public motorized transportation

The prefix *d* denotes the domains within the component of *Activities and Participation*. At the user's discretion, the prefix *d* can be replaced by *a* or *p*, to denote activities or participation respectively.

Data element attributes

Collection and usage attributes

Guide for use:

This metadata item, in conjunction with Activity difficulty level code N, enables the provision of information about the presence and extent of activity limitation for any given life area; with Activity need for assistance code N, the provision of information about the need for assistance with the given life area.

The extent of, and level of satisfaction with, participation in a given area are indicated by the use of this metadata item with the qualifiers Participation extent code N and Participation satisfaction level code N.

Activity when injured

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Injury event – activity type, code (ICD-10-AM 7th edn) ANNNN
<i>METeOR identifier:</i>	391320
<i>Registration status:</i>	Health, Standard 22/12/2009
<i>Definition:</i>	The type of activity being undertaken by the person when injured, as represented by a code.
Data Element Concept:	Injury event – activity type

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	ANNNN
<i>Maximum character length:</i>	5

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Admitted patient: External cause codes V00 to Y34 must be accompanied by an activity code.
<i>Comments:</i>	Enables categorisation of injury and poisoning according to factors important for injury control. Necessary for defining and monitoring injury control targets, injury costing and identifying cases for in-depth research. This term is the basis for identifying work-related and sport-related injuries.

6	Unspecified activities																																				

Collection and usage attributes

Guide for use:

To be used for injury surveillance purposes for non-admitted patients when it is not possible to use ICD-10-AM codes. Select the code which best characterises the type of activity being undertaken by the person when injured, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate, select the one that comes first in the code list.

Data element attributes

Collection and usage attributes

Comments:

Enables categorisation of injury and poisoning according to factors important for injury control. Necessary for defining and monitoring injury control targets, injury costing and identifying cases for in-depth research. This item is the basis for identifying work-related and sport-related injuries.

Data element attributes

Collection and usage attributes

Guide for use:

More than one procedure can be recorded. Record all codes that apply.

Codes '88' and '99' in combination cannot be used in multiple entries.

CODE 06 Reperfusion: primary percutaneous coronary intervention (PCI)

Primary PCI relates to balloon angioplasty and/or stent implantation for reperfusion therapy of a ST-segment-elevation myocardial infarction (STEMI).

CODE 07 Reperfusion: rescue percutaneous coronary intervention (PCI)

Rescue PCI relates to a balloon angioplasty and/or stent implantation that is performed following failed fibrinolysis in people with continuing or recurrent myocardial ischaemia.

CODE 18 Revascularisation: percutaneous coronary intervention (PCI)

Revascularisation PCI relates to the restoration of blood flow through balloon angioplasty and/or stent implantation outside the setting of myocardial salvage for STEMI. Revascularisation PCI may be performed on a person following STEMI where there is objective evidence of spontaneous or inducible ischaemia or haemodynamic instability. Revascularisation PCI may also be performed on a person with high-risk non-ST-segment-elevation acute coronary syndrome.

When read in conjunction with Person – clinical procedure timing, code N, this metadata item provides information on the procedure(s) provided to a patient prior to or during this presentation.

When read in conjunction with Person – acute coronary syndrome risk stratum, code N, codes 01, 05, 06, 07, 08, 09, 10 and 18 of this metadata item provide information for risk stratification.

Where codes 06, 07 and 18 have been recorded please also record Person - percutaneous coronary intervention procedure, code N.

Collection methods:

For each Person-acute coronary syndrome procedure type, code NN, the following timing data elements must also be recorded, where applicable:

- Person - clinical procedure timing, code N
- Person - intravenous fibrinolytic therapy date, DDMMYYYY
- Person - intravenous fibrinolytic therapy time, hhmm

- Person - primary percutaneous coronary intervention date, DDMMYYYY
- Person - primary percutaneous coronary intervention time, hhmm
- Person - rescue percutaneous coronary intervention date, DDMMYYYY
- Person - rescue percutaneous coronary intervention time, hhmm
- Person - revascularisation percutaneous coronary intervention date, DDMMYYYY
- Person - revascularisation percutaneous coronary intervention time, hhmm
- Person - pacemaker insertion date, DDMMYYYY
- Person - pacemaker insertion time, hhmm
- Person - implantable cardiac defibrillator procedure date, DDMMYYYY
- Person - implantable cardiac defibrillator procedure time, hhmm
- Person - intra-aortic balloon pump procedure date, DDMMYYYY
- Person - intra-aortic balloon pump procedure time, hhmm
- Person - non-invasive ventilation administration date, DDMMYYYY
- Person - non-invasive ventilation administration time, hhmm

Collection and usage attributes

Guide for use:

CODE 1 Cardiogenic shock

Use this code when the person has experienced cardiogenic shock, including if the person was in shock at the time of presentation to the hospital.

Cardiogenic shock is defined as:

- hypotension (systolic BP <90mmHg for at least 30 minutes or the need for supportive measures to maintain blood pressure of greater than or equal to 90mmHg)
- end-organ hypoperfusion (cool extremities or a urine output of <30ml/hour, and a heart rate \geq 60 beats/minute)
- a cardiac index of no more than 2.2 l/min per square meter of body-surface area and a pulmonary-capillary wedge pressure of at least 15 mmHg.

CODE 2 Cardiac rupture

Use this code when the person has a rupture of the ventricular myocardium, the ventricular septum, or a frank papillary muscle rupture. This includes if the person experienced the rupture before presentation to the hospital.

CODE 3 Cardiac arrest

Use this code when the person has experienced cardiac arrest (i.e. the lack of effective cardiac output), including if the person was under arrest at the time of presentation to the hospital.

CODE 4 New or recurrent myocardial infarction

Use this code when the person experiences a myocardial infarction during hospitalisation distinct from the index event at the time of presentation.

Recurrent myocardial infarction is defined by clinical events and cardiac marker elevations after the first 24 hours following presentation to the hospital.

For people presenting without initial evidence of myonecrosis, recurrent MI is defined by:

- A rise in troponin T or I to greater than the diagnostic threshold level (with precision of 10% coefficient of variation) as defined by the local laboratory; OR
- A CK-MB elevation of greater than twice the upper limit of normal for the laboratory (if CK-MB is not available, CK may be used).

For people presenting with evidence of myonecrosis:

- A further rise in troponin of greater than 25% or a re-elevation in CK-MB of greater than 50% (if no CK-MB is drawn, CK may be used) will define recurrent MI
- If the event occurs within 24 hours of PCI, then a level of greater than 3 times the upper limit of normal for CK-MB will be used. If the event occurs within 24 hours of CABG, then a level of greater than 5 times the upper limit of normal for CK-MB will be used.

CODE 5 Stroke

Use this code if the person experiences a loss of neurological function with residual symptoms remaining for at least 24 hours after onset and which occurred before presentation to the hospital. The occurrence of stroke should be evidenced by a record of cerebral imaging (CT or MRI).

CODE 6 Acute pulmonary oedema/congestive heart failure

Use this code when the person has experienced acute pulmonary oedema or congestive heart failure with evidence of supportive clinical signs of ventricular dysfunction. These include:

- Third heart sound (S3)
- Cardiomegaly
- Elevated jugular venous pressure (JVP)
- Chest X-ray evidence of pulmonary congestion
- Requirement for ventilatory assistance (CPAP or intubation).

This includes if acute pulmonary oedema or congestive heart failure was present at the time of presentation to the hospital.

CODE 7 Recurrent rest angina with electrocardiogram (ECG) changes

Use this code when the person has experienced recurrent ischaemic pain occurring at rest believed to be cardiac in origin with associated ECG changes.

CODE 8 Recurrent rest angina without electrocardiogram (ECG) changes

Use this code when the person has experienced recurrent ischaemic pain occurring at rest believed to be cardiac in origin without associated ECG changes.

CODE 9 New onset arrhythmia: atrial

Use this code when the person has experienced an atrial arrhythmia, that was not present before this acute coronary syndrome event, documented by one of the following:

- Atrial fibrillation/flutter
- Supraventricular tachycardia requiring treatment (i.e. requiring cardioversion, drug therapy, or is sustained for greater than one minute).

CODE 10 New onset arrhythmia: ventricular

Use this code when the person has experienced ventricular tachycardia or ventricular fibrillation requiring cardioversion and/or intravenous antiarrhythmics, that was not present before this acute coronary syndrome event.

CODE 11 New onset arrhythmia: heart block (1,2,3)

Use this code when the person has experienced first, second or third degree atrioventricular block with bradycardia with or without the requirement for pacing.

CODE 12 Unplanned revascularisation

Use this code when the person has undergone revascularisation precipitated by 20 minutes or more of recurrent chest pain with/or without objective evidence of ischaemia on the ECG.

Code 13 Acute renal failure

Use this code when the person has acute renal failure as determined by a rise in serum creatinine of x 1.5 or a decrease in GFR by 25% or urine output <0.5mL/kg/h for 6 hours.

Code 14 Thrombocytopenia

Use this code when the person has thrombocytopenia as determined by the platelet count: platelet count dropped to less than $100 \times 10^9/L$.

Data element attributes

Collection and usage attributes

Guide for use:

Record all clinical events that the person experiences from the time of presentation to hospital until discharge from hospital.

More than one event may be recorded.

The time and date must be recorded for each clinical event that occurs.

Comments:

An acute coronary syndrome (ACS) related clinical event is a clinical event which can affect the health outcomes of a person with ACS.

Information on the occurrence of these clinical events in people with ACS is required due to an emerging appreciation of their relationship with late mortality.

Collection and usage attributes

Guide for use:

Angina:

CODE 11 Angina (excluding unstable angina): prior existing

This code is used where there are symptoms, which can be described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing) suggestive of cardiac ischaemia, the onset of which occurred more than two weeks ago.

CODE 12 Angina (excluding unstable angina): new onset

This code is used where there are symptoms which can be described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing) suggestive of cardiac ischaemia; the onset of which occurred two or less weeks ago.

CODE 13 Unstable angina

This code is used where a person has experienced new onset or prior existing angina (described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing)), which is increasing in severity, duration or frequency.

Chronic lung disease:

CODE 21 Chronic lung disease

This code is used where there is a history or symptoms suggestive of chronic lung disease.

Heart failure:

CODE 31 Heart failure

This code is used where a person has past or current symptoms of heart failure (typically breathlessness or fatigue), either at rest or during physical activity and/or signs of pulmonary or peripheral congestion suggestive of cardiac dysfunction.

Hypertension:

CODE 41 Hypertension

This code is used where there is current use of pharmacotherapy for hypertension and/or clinical evidence of high blood pressure.

CODE 51 Ischaemic: non-haemorrhagic cerebral infarction

This code is used if there is history of stroke or cerebrovascular accident (CVA) resulting from an ischaemic event where the patient suffered a loss of neurological function with residual symptoms remaining for at least 24 hours.

CODE 52 Haemorrhagic: intracerebral haemorrhage

This code is used if there is history of stroke or cerebrovascular accident (CVA) resulting from a haemorrhagic event where the patient suffered a loss of neurological function with residual symptoms remaining for at least 24 hours.

Peripheral arterial disease:

CODE 61 Peripheral artery disease

This code is used where there is history of either chronic or acute occlusion or narrowing of the arterial lumen in the aorta or extremities.

CODE 62 Aortic aneurysm

This code is used where there is a history of aneurysmal dilatation of the aorta (thoracic and or abdominal).

CODE 63 Renal artery stenosis

This code is used where there is a history of functional stenosis of one or both renal arteries.

Sleep apnoea syndrome:

CODE 71 Sleep apnoea

This code is used where there is evidence of sleep apnoea syndrome (SAS) on history.

Myocardial infarction:

CODE 81 Previous myocardial infarction

This code is used where a person has previously experienced a myocardial infarction, excluding the current event that prompted this presentation to hospital. This may be supported by clinical documentation and evidenced by ECG changes or serum cardiac biomarker changes.

Other vascular conditions:

CODE 91 Atrial fibrillation

This code is used where there is a history or symptoms suggestive of atrial fibrillation.

CODE 92 Other cardiac arrhythmias or conductive disorders

This code is used where there is a history of other cardiac arrhythmias or conductive disorders.

CODE 93 Left ventricular hypertrophy

This code is used where there is a history or symptoms suggestive of left ventricular hypertrophy.

Data element attributes

Collection and usage attributes

Guide for use:

More than one medical condition may be recorded.

Record only those codes that apply.

Record all codes that apply.

Collection methods:

Where codes 21, 31, 51, 52, 61, 62, 63, 71, 91, 92 and 93 are recorded Person - clinical evidence status (acute coronary syndrome related medical conditions), yes/no code N must also be recorded.

Comments:

A history of the listed medical conditions is pertinent to the risk stratification and treatment of acute coronary syndrome.

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 ST-segment-elevation (myocardial infarction)</p> <p>This code is used where persistent ST elevation of ≥ 1mm in two contiguous limb leads, or ST elevation of ≥ 2mm in two contiguous chest leads, or with new left bundle -branch block (BBB) pattern on the ECG.</p> <p>This classification is intended for identification of patients potentially eligible for reperfusion therapy, either pharmacologic or intervention-based. Other considerations such as the time to presentation and the clinical appropriateness of instituting reperfusion are not reflected in this metadata item.</p> <p>CODE 2 Non-ST-segment-elevation ACS with high-risk features</p> <p>This code is used when presentation with clinical features consistent with an acute coronary syndrome with high-risk features which include any of the following:</p>
-----------------------	---

- repetitive or prolonged (> 10 minutes) ongoing chest pain or discomfort;
- elevated level of at least one cardiac biomarker (troponin or creatine kinase-MB isoenzyme);
- persistent or dynamic ECG changes of ST segment depression $\geq 0.5\text{mm}$ or new T wave $\geq 2\text{mm}$;
- transient ST-segment elevation ($\geq 0.5\text{ mm}$) in more than 2 contiguous leads;
- haemodynamic compromise: Blood pressure $< 90\text{ mmHg}$ systolic, cool peripheries, diaphoresis, Killip Class > 1 , and/or new onset mitral regurgitation;
- sustained ventricular tachycardia;
- syncope;
- left ventricular systolic dysfunction (left ventricular ejection fraction < 0.40);
- prior percutaneous coronary intervention within 6 months or prior coronary artery bypass surgery;
- presence of known diabetes (with typical symptoms of ACS);or
- chronic kidney disease (estimated glomerular filtration rate $< 60\text{mL/minute}$) (with typical symptoms of ACS).

This classification is intended for identification of patients potentially eligible for aggressive medical management and coronary angiography and revascularisation.

CODE 3 Non-ST-segment-elevation ACS with intermediate-risk features

This code is used when presentation with clinical features consistent with an acute coronary syndrome and any of the following intermediate-risk features AND NOT meeting the criteria for high-risk ACS:

- chest pain or discomfort within the past 48 hours that occurred at rest, or was repetitive or prolonged (but currently resolved);
- age greater than 65yrs;
- known coronary heart disease: prior myocardial infarction with left ventricular ejection fraction ≥ 0.40 known coronary lesion more than 50% stenosed;
- no high-risk changes on electrocardiography (see high-risk features);
- two or more of the following risk factors: known hypertension, family history, active smoking or hyperlipidaemia;
- presence of known diabetes (with atypical symptoms of ACS);
- chronic kidney disease (estimated glomerular filtration rate $< 60\text{mL/minute}$) (with atypical symptoms of ACS); or
- prior aspirin use.

This classification is intended for identification of patients potentially eligible for accelerated diagnostic evaluation and further risk stratification.

CODE 4 Non-ST-segment-elevation ACS with low-risk features

This code is used when presentation with clinical features consistent with an acute coronary syndrome without intermediate or high-risk features of non-ST-segment-elevation ACS. This includes onset of anginal symptoms within the last month, or worsening in severity or frequency of angina, or lowering of anginal threshold.

This classification is intended for identification of patients potentially eligible for outpatient investigation discharge on upgraded medical therapy and outpatient investigation.

Data element attributes

Collection and usage attributes

Guide for use:

Other clinical considerations influencing the decision to admit and investigate are not reflected in this metadata item. This metadata item is intended to simply provide a diagnostic classification at the time of, or within hours of clinical presentation.

Acute coronary syndrome symptoms may include:

- tightness, pressure, heaviness, fullness or squeezing in the chest which may spread to the neck and throat, jaw, shoulders, the back, upper abdomen, either or both arms and even into the wrists and hands
- dyspnoea, nausea/vomiting, cold sweat or syncope.

Collection methods:

Recorded at time of presentation.

Only one code should be recorded.

Must be recorded in conjunction with Person – acute coronary syndrome procedure type, code NN and Person – clinical procedure timing, code N.

Comments:

The clinical, electrocardiogram and biochemical characteristics are important to enable early risk stratification.

<i>METeOR identifier:</i>	391322
<i>Registration status:</i>	Health, Standard 22/12/2009
<i>Definition:</i>	A condition or complaint either coexisting with the principal diagnosis or arising during the episode of admitted patient care, episode of residential care or attendance at a health care establishment, as represented by a code.
Data Element Concept:	Episode of care – additional diagnosis

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	ANN{.N[N]}
<i>Maximum character length:</i>	6

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Record each additional diagnosis relevant to the episode of care in accordance with the ICD-10-AM Australian Coding Standards. Generally, external cause, place of occurrence and activity codes will be included in the string of additional diagnosis codes. In some data collections these codes may also be copied into specific fields.</p> <p>The diagnosis can include a disease, condition, injury, poisoning, sign, symptom, abnormal finding, complaint, or other factor influencing health status.</p> <p>Additional diagnoses give information on the conditions that are significant in terms of treatment required, investigations needed and resources used during the episode of care. They are used for casemix analyses relating to severity of illness and for correct classification of patients into Australian Refined Diagnosis Related Groups (AR-DRGs).</p>
<i>Collection methods:</i>	An additional diagnosis should be recorded and coded where appropriate upon separation of an episode of admitted patient care or the end of an episode of residential care or attendance at a health care establishment. The additional diagnosis is derived from and must be substantiated by clinical documentation.

Comments:

Additional diagnoses should be interpreted as conditions that affect patient management in terms of requiring any of the following:

- Commencement, alteration or adjustment of therapeutic treatment
- Diagnostic procedures
- Increased clinical care and/or monitoring

In accordance with the Australian Coding Standards, certain conditions that do not meet the above criteria may also be recorded as additional diagnoses.

Additional diagnoses are significant for the allocation of Australian Refined Diagnosis Related Groups. The allocation of patient to major problem or complication and co-morbidity Diagnosis Related Groups is made on the basis of the presence of certain specified additional diagnoses. Additional diagnoses should be recorded when relevant to the patient's episode of care and not restricted by the number of fields on the morbidity form or computer screen.

External cause codes, although not diagnosis of condition codes, should be sequenced together with the additional diagnosis codes so that meaning is given to the data for use in injury surveillance and other monitoring activities.

Address line (person)

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person (address)— address line, text [X(180)]
<i>Synonymous names:</i>	Australian address line
<i>METeOR identifier:</i>	286620
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 30/09/2005
<i>Definition:</i>	A composite of one or more standard address components that describes a low level of geographical/physical description of a location, as represented by text. Used in conjunction with the other high-level address components i.e. Suburb/town/locality, Postcode— Australian, Australian state/territory, and Country, forms a complete geographical/physical address of a person.
Data Element Concept:	Person (address)— address line

Value domain attributes

Representational attributes

<i>Representation class:</i>	Text
<i>Data type:</i>	String
<i>Format:</i>	[X(180)]
<i>Maximum character length:</i>	180

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A high-level address component is defined as a broad geographical area that is capable of containing more than one specific physical location. Some examples of a broad geographical area are:</p> <ul style="list-style-type: none">- Suburb, town or locality- Postcode— Australian or international- State, Territory, local government area, electorate, statistical local area- Postal delivery point identifier- Countries, provinces, etc other than in Australia <p>These components of a complete address do not form part of the Address line.</p> <p>When addressing an Australian location, following are the standard address data elements that may be concatenated in the Address line:</p> <ul style="list-style-type: none">- Building/complex sub-unit type- Building/complex sub-unit number
-----------------------	---

- Building/property name
- Floor/level number
- Floor/level type
- House/property number
- Lot/section number
- Street name
- Street type code
- Street suffix code

One complete identification/description of a location/site of an address can comprise one or more than one instance of address line.

Instances of address lines are commonly identified in electronic information systems as Address-line 1, Address-line 2, etc.

The format of data collection is less important than consistent use of conventions in the recording of address data. Hence, address may be collected in an unstructured manner but should ideally be stored in a structured format.

Where Address line is collected as a stand-alone item, software may be used to parse the Address line details to separate the sub-components.

Multiple Address lines may be recorded as required.

Collection methods:

The following concatenation rules should be observed when collecting address lines addressing an Australian location.

- Building/complex sub-unit type is to be collected in conjunction with Building/complex sub-unit number and vice versa.
- Floor/level type is to be collected in conjunction with Floor/level number and vice versa.
- Street name is to be used in conjunction with Street type code and Street suffix code.
- Street type code is to be used in conjunction with Street name and Street suffix code.
- Street suffix code is to be used in conjunction with Street name and Street type code.
- House/property number is to be used in conjunction with Street name.

<i>Guide for use:</i>	<p>CODE 1 Business</p> <p>This code is used to indicate an address that is the physical location of a business, an office or from where a service is delivered.</p> <p>CODE 2 Mailing or postal</p> <p>This code is used to indicate an address that is only for correspondence purposes.</p> <p>CODE 3 Residential</p> <p>This code is used to indicate where a person is living. Note that this code is not valid for organisations.</p> <p>CODE 4 Temporary residential</p> <p>Temporary accommodation address (such as for a person from rural Australia who is visiting an oncology centre for a course of treatment, or a person who usually resides overseas). Note that this is not valid for organisations.</p>
-----------------------	--

CODE 9 Unknown/Not stated/inadequately described

This code may also be used where the person has no fixed address or does not wish to have their residential or a correspondence address recorded.

Data element attributes

Collection and usage attributes

Guide for use:

A single address may have multiple address types associated with it. Record as many as required.

Collection methods:

At least one address must be recorded (this may be an unknown Address type).

Health care establishments should always attempt to collect the residential address of a person who is a health care client when a service is provided. When recording the address for a health care provider or organisation, the business address should always be collected. In addition, other addresses may also need to be recorded for individuals and organisations.

Overseas address:

For individuals record the overseas address as the residential address and record a temporary accommodation address as their contact address in Australia.

Comments:

'No fixed address' is coded as unknown because it (the concept) is not a type of address for a person but is an attribute of the person only i.e. it is not a location for which an address may be derived. It is not recommended that an implementation collects this attribute as an address type. A person not having a fixed address constrains the number of address types that can be collected i.e. temporary accommodation and residential address types cannot be collected. However, if it is imperative that this occurs, it is suggested that code 9 be used.

Administrative health region palliative care strategic plan indicator

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Administrative health region – palliative care strategic plan indicator, yes/no code N
<i>METeOR identifier:</i>	288331
<i>Registration status:</i>	Health, Standard 05/12/2007
<i>Definition:</i>	Whether an administrative health region has a written strategic plan which incorporates palliative care elements, as represented by a code.
Data Element Concept:	Administrative health region – palliative care strategic plan indicator

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code						
<i>Data type:</i>	Boolean						
<i>Format:</i>	N						
<i>Maximum character length:</i>	1						
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Yes</td></tr><tr><td>2</td><td>No</td></tr></tbody></table>	Value	Meaning	1	Yes	2	No
Value	Meaning						
1	Yes						
2	No						

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A palliative care strategic plan may be an entire health region's plan, or an aggregation of the region's sub-units' plans. The plan may be specifically for palliative care or a general health service plan that includes palliative care elements.</p> <p>The palliative care elements in the plan must include all of the following aspects:</p> <ul style="list-style-type: none">• timeframe (the beginning and end-date in years), with a minimum time period of two years to demonstrate a strategic focus• measurable objectives relating to: service access, quality, utilisation, responsiveness and evaluation• demonstrated stakeholder involvement in plan development, such as the inclusion of a description of the consultation process in the strategic plan document• demonstrated links with the National Palliative Care Strategy
-----------------------	--

- implementation strategies (can include resources identified for service delivery)
- evidence of ongoing development in subsequent plans.

A strategic plan typically has a mission statement, outlines a vision, values and strategies, and includes goals and objectives. A strategic plan may: serve as a framework for decisions; provide a basis for more detailed planning; explain the business to others in order to inform, motivate and involve; assist benchmarking and performance monitoring; stimulate change and become a building block for next plan.

The plan will ideally address both palliative care at the specialist level and palliative care at the primary care (i.e. non-specialist) level.

CODE 1 Yes

The administrative health region has a written strategic plan which incorporates palliative care elements, and which includes all specified strategic plan aspects.

CODE 2 No

The administrative health region does not have a written strategic plan which incorporates palliative care elements, or has a plan with only partial coverage of the specified strategic plan aspects.

receive public hospital services free of charge at the discretion of the hospital, and prisoners, who are Medicare ineligible while incarcerated.

Data element attributes

Collection and usage attributes

Guide for use:

Australian Health Care Agreements 2003–08 state that eligible persons are to be given the choice to receive, free of charge as public patients, health and emergency services.

At the time of, or as soon as practicable after, admission for a public hospital service, the patient must elect in writing to be treated as either

- a public patient or
- a private patient

This item is independent of the patient's hospital insurance status and room type.

Notes:

Inability to sign: In cases where the patient is unable to complete the patient election form, the patient should be assumed to be a public patient.

Compensation funding decisions: A patient may be recorded as a public patient as an interim patient election status while the patient's compensable status is being decided.

Inter-hospital contracted care: If the patient receives inter-hospital contracted care the following guidelines can be used if no further information is available:

- If the patient received contracted care that was purchased by a public hospital then it will be assumed that they elected to be treated as a public patient.
- If the patient received contracted care that was purchased by a private hospital then it will be assumed that they elected to be treated as a private patient.

Age

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – age, total years N[NN]
<i>METeOR identifier:</i>	303794
<i>Registration status:</i>	Health, Standard 08/02/2006 Community services, Standard 29/04/2006 Housing assistance, Standard 10/02/2006
<i>Definition:</i>	The age of the person in (completed) years at a specific point in time.
<i>Context:</i>	Age is a core data element in a wide range of social, labour and demographic statistics. It is used in the analyses of service utilisation by age group and can be used as an assistance eligibility criterion.
Data Element Concept:	Person – age

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NN]
<i>Maximum character length:</i>	3
<i>Supplementary values:</i>	Value Meaning 999 Unknown/not stated
<i>Unit of measure:</i>	Year

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Age in single years (if aged under one year, record as zero). If age (or date of birth) is unknown or not stated, and cannot be estimated, use Code 999. National community services and housing assistance data dictionary specific: If year of birth is known (but date of birth is not) use the date, 0101YYYY of the birth year to estimate age (where YYYY is the year of birth). National housing assistance data dictionary specific: In the housing assistance data collections age is calculated at 30 June for the corresponding year.
<i>Collection methods:</i>	Although collection of date of birth allows more precise calculation of age, this may not be feasible in some data collections, and alternative questions are: Age last birthday? What was age last birthday?

What is age in complete years?

Comments:

National community services data dictionary specific:

Different rules for reporting data may apply when estimating the Date of birth of children aged under 2 years since the rapid growth and development of children within this age group means that a child's development can vary considerably over the course of a year. Thus, more specific reporting of estimated age is recommended.

Those who need to conduct data collections for children where age is collected in months, weeks, or days should do so in a manner that allows for aggregation of those results to this standard.

<i>Supplementary values:</i>	99 Not stated																				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Used in computer assisted telephone interview (CATI) surveys in cases where the specific age is not available. Depending on the collection a different starting age may be used, but should map back to the standard output. Information at a finer level can be collected as long as it maps back to the proposed data domain, e.g. 75+ age group can be split into 75-84 and 85 years or older.
<i>Collection methods:</i>	Although collection of date of birth allows more precise calculation of age, as does the collection of a single age, this may not always be feasible. Age range should be derived from a

question on date of birth or age at last birthday.

Comments:

In cases where an exact age is not known or not stated, age may be reported as an age range. The age ranges are consistent with the standard 10 year ranges recommended by the ABS.

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	The World Health Organisation, in its 2000 International Guide for Monitoring Alcohol Consumption and Related Harm document, suggests that in assessing alcohol consumption patterns a ‘Graduated Quantity Frequency’ method is preferred. This method requires that questions about the quantity and frequency of alcohol consumption should be asked to help determine short-term and long-term health consequences. This
----------------------------	---

information can be collected (but not confined to) the following ways:

- in a clinical setting with questions asked by a primary healthcare professional
- as a self-completed questionnaire in a clinical setting
- as part of a health survey
- as part of a computer aided telephone interview.

It should be noted that, particularly in telephone interviews, the question(s) asked may not be a direct repetition of the Value domain; yet they may still yield a response that could be coded to the full Value domain or a collapsed version of the Value domain.

Alcohol consumption in standard drinks per day (self reported)

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – alcohol consumption amount (self-reported), total standard drinks NN
<i>METeOR identifier:</i>	270249
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	A person's self-reported usual number of alcohol-containing standard drinks on a day when they consume alcohol.
Data Element Concept:	Person – alcohol consumption amount

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	NN
<i>Maximum character length:</i>	2
<i>Supplementary values:</i>	Value Meaning
	99 Consumption not reported
<i>Unit of measure:</i>	Standard drink

Collection and usage attributes

<i>Guide for use:</i>	Alcohol consumption is usually measured in standard drinks. An Australian standard drink contains 10 grams of alcohol, which is equivalent to 12.5 millilitres of alcohol.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>This estimation is based on the person's description of the type (spirits, beer, wine, other) and number of standard drinks, as defined by the National Health and Medical Research Council (NH&MRC), consumed per day. One standard drink contains 10 grams of alcohol.</p> <p>The following gives the NH&MRC examples of a standard drink:</p> <ul style="list-style-type: none">• Light beer (2.7%): - 1 can or stubbie = 0.8 a standard drink• Medium light beer (3.5%): - 1 can or stubbie = 1 standard drink• Regular Beer - (4.9% alcohol):
-----------------------	---

- 1 can = 1.5 standard drinks
- 1 jug = 4 standard drinks
- 1 slab (cans or stubbies) = about 36 standard drinks
- Wine (9.5% - 13% alcohol):
 - 750-ml bottle = about 7 to 8 standard drinks
 - 4-litre cask = about 30 to 40 standard drinks
- Spirits:
 - 1 nip = 1 standard drink
 - Pre-mixed spirits (around 5% alcohol) = 1.5 standard drinks

When calculating consumption in standard drinks per day, the total should be reported with part drinks recorded to the next whole standard drink (e.g. 2.4 = 3).

Collection methods:

The *World Health Organisation's 2000 International Guide for Monitoring Alcohol Consumption and Related Harm* document suggests that in assessing alcohol consumption patterns a 'Graduated Quantity Frequency' method is preferred. This method requires that questions about the quantity and frequency of alcohol consumption should be asked to help determine short-term and long-term health consequences.

Collection and usage attributes

<i>Guide for use:</i>	
<i>Comments:</i>	Note: Code 3, which had a meaning in previous versions of the data standard is no longer used. As is good practice, the code will not be reused.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Systemic opioids include both intra-muscular and intravenous opioids. Code 7: this code is used when this technique has been selected for the administration of analgesia for labour.
<i>Collection methods:</i>	More than one agent or technique can be recorded, except where 1=none applies.

This item is to be recorded for first and second stage labour, but not third stage labour e.g. removal of placenta.

Comments:

Analgesia use may influence the duration of labour, may affect the health status of the baby at birth and is an indicator of obstetric intervention.

<i>Supplementary values:</i>	9 Not stated/inadequately described										

Collection and usage attributes

<i>Guide for use:</i>	<p>Code 1 No angina with ordinary physical activity Use this code for patients who have no angina on ordinary physical activity such as walking or stair climbing. Angina occurs with strenuous, rapid or prolonged exertion at work or recreation.</p> <p>Code 2 Slight limitation of ordinary physical activity Use this code for patients for whom angina occurs on walking or climbing stairs rapidly, walking uphill, walking or climbing stairs after a meal, or under emotional stress, or in the cold, or only during the first few hours after waking.</p> <p>Code 3 Marked limitation or ordinary physical activity Use this code for patients where angina occurs walking one or two blocks on the level and climbing one or more flights of stairs in normal conditions and at a normal pace.</p>
-----------------------	---

Code 4 Inability for any physical activity without anginal symptoms

Use this code for patients who are unable to carry on any physical activity without discomfort - anginal symptoms may be present at rest.

Collection methods:

Angina status is self-reported by the person but is interpreted, coded and recorded by the health professional.

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	1	Public
	2	Private

Collection and usage attributes

<i>Guide for use:</i>	CODE 1 Public patient: An eligible person who receives or elects to receive a public hospital service free of charge. CODE 2 Private patient: An eligible person who elects to be treated as a private patient; and elects to be responsible for paying fees of the type referred to in clause 57 (clause 58 of the Northern Territory Agreement) of the Australian Health Care Agreements. Clause 57 states that 'Private patients and ineligible persons may be charged an amount for public hospital services as determined by the State'.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The election status nominated by the patient at the time of being placed on an elective surgery waiting list, to be treated as either: <ul style="list-style-type: none">• a public patient; or• a private patient
-----------------------	---

This item is independent of patient's hospital insurance status. The definitions of a public and private patient are those in the 1998-2003 Australian Health Care Agreements

Patients whose charges are to be met by the Department of Veterans' Affairs are regarded as private patients.

Comments:

Anticipated election status may be used for the management of elective surgery waiting lists, but the term is not defined under the 1998-2003 Australian Health Care Agreements. Under the Australian Health Care Agreements, patients are required to elect to be treated as a public or private patient, at the time of, or as soon as practicable after admission. Therefore, the anticipated patient election status is not binding on the patient and may vary from the election the patient makes on admission.

<i>Guide for use:</i>	<p>CODE 01 GENERAL DENTAL PRACTICE</p> <p>That part of dental practice that deals with a range of general dental care.</p> <p>CODE 02 DENTO-MAXILLOFACIAL RADIOLOGY</p> <p>That part of dental practice that deals with diagnostic imaging procedures applicable to the hard and soft tissues of the oral and</p>
-----------------------	---

maxillofacial region and to other structures which are relevant for the proper assessment of oral conditions.

CODE 03 ENDODONTICS

That part of dental practice that deals with the morphology, physiology, and pathology of the human tooth and, in particular, the dental pulp, root and peri-radicular tissues. It includes the biology of the normal pulp, crown, root and peri-radicular tissues and the aetiology, prevention, diagnosis and treatment of diseases and injuries that affect these tissues.

CODE 04 ORAL AND MAXILLOFACIAL SURGERY

That part of dental practice that deals with the diagnosis, surgical and adjunctive treatment of diseases, injuries and defects of the human jaws and associated structures.

CODE 05 ORAL SURGERY

That part of dental practice that deals with the diagnosis, surgical and adjunctive treatment of diseases and injuries limited to the dento-alveolar complex.

CODE 06 ORAL MEDICINE

That part of dental practice that deals with the clinical diagnosis, assessment and principally non-surgical, pharmacological management of anatomical variants, pathological conditions, diseases and pain of the dental, oral and adjacent anatomical structures and the dental/oral manifestations and complications of systemic diseases, pathology and conditions and their treatment.

CODE 07 ORAL PATHOLOGY

That part of dental practice that deals with diseases of the teeth, jaws, oral soft tissues and associated structures, studies their causes, pathogenesis and effects, and by use of clinical, radiographic, microscopic and other laboratory procedures establishes differential diagnoses and provides forensic evaluations.

CODE 08 ORTHODONTICS

That part of dental practice that deals with the study and supervision of the growth and development of the dentition and its related anatomical structures, including preventive and corrective procedures of dentofacial irregularities requiring the re-positioning of teeth, jaws, and/or soft tissues by functional or mechanical means.

CODE 09 PAEDIATRIC DENTISTRY (PAEDODONTICS)

That part of dental practice that deals with the prevention and the treatment of dental diseases and abnormalities in children and their associated developmental and behavioural problems.

CODE 10 PERIODONTICS

That part of dental practice that deals with the prevention, recognition, diagnosis and treatment of the diseases and disorders of the investing and supporting tissues of natural teeth or their substitutes.

CODE 11 PROSTHODONTICS

That part of dental practice that deals with the restoration and maintenance of oral health, function and appearance by coronal alteration or reconstruction of natural teeth, or the replacement of missing teeth and contiguous oral and maxillofacial tissues with substitutes.

CODE 12 PUBLIC HEALTH DENTISTRY

That part of dental practice that deals with the community as the patient rather than the individual, being concerned with oral health education of the public, applied dental research and administration of dental care programmes including prevention and control of oral diseases on a community basis.

CODE 13 SPECIAL NEEDS DENTISTRY

That part of dental practice that deals with patients where intellectual disability, medical, physical or psychiatric conditions require special methods or techniques to prevent or treat oral health problems, or where such conditions necessitate special dental treatment plans.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

<i>Guide for use:</i>	The midwifery care during the woman's pregnancy, labour and birth and the postnatal period as well as the care of the well, normal baby is undertaken in partnership with the woman, consulting and referring to other health professionals as required. This care also includes preventative measures, the promotion of normal birth, the detection of complication in mother and child, accessing medical care or other appropriate assistance and the carrying out of emergency measures.
-----------------------	--

CODE 01 ANTENATAL CARE

Care, including counselling and education of the woman, and care of her unborn baby from the time the woman's pregnancy is diagnosed until the onset of labour.

CODE 02 CARE DURING LABOUR AND BIRTH

Care, including advocacy and support of the woman and her baby during all stages of labour and during the baby's birth.

CODE 03 CONTINUUM OF MIDWIFERY CARE

Care across the continuum of the woman's pregnancy, labour, the baby's birth and the post natal period.

CODE 04 MATERNAL AND CHILD HEALTH

Care of the mother and child following the postnatal period of 6 weeks focussing on parenting and the child's growth and development, up until at least the age of 5 years and in some cases beyond that age.

CODE 05 MIDWIFERY EDUCATION

The design, planning, implementation, delivery and evaluation of midwifery education and/or staff development programs and management of educational resources.

CODE 06 MIDWIFERY MANAGEMENT

The management of a health unit or sub-unit of a service, hospital or community health care facility providing midwifery services and care, supervising midwives and the financial resources to enable the provision safe, cost effective midwifery care within the service and monitors quality, clinical standards and the professional development of midwives.

CODE 07 MIDWIFERY RESEARCH

The design, planning, implementation and evaluation of midwifery research programs and projects and management of research resources.

CODE 08 NEONATAL CARE

Care and close observation of the normal well newborn baby ensuring the baby's continued well being, growth and development in the first 6 weeks of life.

CODE 09 POSTNATAL CARE

Care, including counselling and education of the woman and care of her baby from the baby's birth until the baby is 6 weeks old.

CODE 10 OTHER

All other areas of midwifery not covered above.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

Collection and usage attributes

<i>Guide for use:</i>	CODE 01 AGED CARE Nursing care to the elderly in community settings, residential aged care facilities, retirement villages and health care facilities.
-----------------------	---

CODE 02 CHILD AND FAMILY HEALTH

Nursing care to children from birth to school age and their families with an emphasis on the prevention, early detection of, and early intervention in, physical, emotional and social problems affecting children and their families such as assistance with parentcraft, immunisation and developmental milestones.

CODE 03 COMMUNITY HEALTH

Nursing care, health counselling, screening and education to individuals, families and groups in the wider community with a focus on patient independence and health promotion.

CODE 04 CRITICAL CARE AND EMERGENCY

Provides nursing care to critically ill patients and patients with unstable health following injury, surgery or during the acute phase of diseases, integrating new technological equipment into care in settings such as high dependency units, intensive care units, emergency departments or retrieval services.

CODE 05 EDUCATION

Design, planning, implementation, evaluation and delivery of nursing education and staff development programs, and management of educational resources.

CODE 06 MANAGEMENT

Management of a health service unit or sub-unit of a hospital, aged care or community health care facility, supervision of nursing staff and financial resources to enable the provision of safe, cost effective nursing care within a specified field or for a particular unit, and monitoring of quality, clinical standards and professional development of nurses.

CODE 07 MEDICAL

Nursing care to patients with conditions, such as infections, metabolic disorders and degenerative conditions, which require medical intervention in a range of health, aged care and community settings.

CODE 08 GENERAL PRACTICE/MEDICAL PRACTICE

Clinical care to patients, clinical organisation and practice administration, and the facilitation of communication within a general practice environment and between the practice and outside organisations and individuals.

CODE 09 MENTAL HEALTH

Nursing care to patients with mental health illness, disorder and dysfunction, and those experiencing emotional difficulties, distress and crisis in health, welfare and aged care facilities, correctional services and the community.

CODE 10 MIDWIFERY

Nursing care and advice to women during pregnancy, labour and childbirth, and postnatal care for women and babies in a range of settings such as the home, community, hospitals, clinics and health units.

CODE 11 PAEDIATRICS

Providing nursing care and advice regarding internal diseases and disorders in children from birth up to, and including, adolescence.

CODE 12 PERI-OPERATIVE

Nursing care to patients before, during and immediately after surgery, assessment of patients' condition, planning of nursing care for surgical intervention, maintenance of a safe and comfortable environment, assistance to Surgeons and Anaesthetists during surgery, and monitoring of patients' recovery from anaesthetic, prior to return to, or discharge from, ward.

CODE 13 REHABILITATION AND DISABILITY

Nursing care to patients recovering from injury and illness, and assistance and facilitation for patients with disabilities to live more independently.

CODE 14 RESEARCH

The design, conduct and evaluation of nursing and interdisciplinary research projects, and promotion of the implementation of research findings into clinical nursing practice.

CODE 15 SURGICAL

Nursing care to patients with injuries and illness that require surgical intervention.

CODE 16 OTHER

All other areas of nursing practice not covered above.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

<i>Classification scheme:</i>	Australian Standard Geographical Classification 2009
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	NNNNN
<i>Maximum character length:</i>	5

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The geographical location is reported using a five digit numerical code. The first digit is the single-digit code to indicate State or Territory. The remaining four digits are the numerical code for the Statistical Local Area (SLA) within the State or Territory.</p> <p>The single digit codes for the states and territories and the four digit codes for the SLAs are as defined in the Australian Standard Geographical Classification (ASGC).</p> <p>The ASGC is updated on an annual basis with a date of effect of 1 July each year. The codes for SLA are unique within each State and Territory, but not within the whole country. Thus, to define a unique location, the code of the State or Territory is required in addition to the code for the SLA.</p> <p>The Australian Bureau of Statistics' (ABS) National Localities Index (NLI) (ABS Catalogue number 1252.0) can be used to assign each locality or address in Australia to a SLA. The NLI is a comprehensive list of localities in Australia with their full code (including State or Territory and SLA) from the main structure of the ASGC.</p> <p>For the majority of localities, the locality name (suburb or town, for example) is sufficient to assign a SLA. However, some localities have the same name. For most of these, limited additional information such as the postcode or State can be used</p>
-----------------------	---

with the locality name to assign the SLA. In addition, other localities cross one or more SLA boundaries and are referred to as split localities. For these, the more detailed information of the number and street of the person's residence is used with the Streets Sub-index of the NLI to assign the SLA.

If the information available on the person's address indicates that it is in a split locality but is insufficient to assign an SLA, the code for the SLA which includes most of the split locality should be reported. This is in accordance with the NLI assignment of SLA when a split locality is identified and further detail about the address is not available.

The NLI does not assign a SLA code if the information about the address is insufficient to identify a locality, or is not an Australian locality. In these cases, the appropriate codes for undefined SLA within Australia (State or Territory unstated), undefined SLA within a stated State or Territory, no fixed place of abode (within Australia or within a stated State or Territory) or overseas should be used.

Collection methods:

When collecting the geographical location of a person's usual place of residence, the Australian Bureau of Statistics (ABS) recommends that 'usual' be defined as: 'the place where the person has or intends to live for 6 months or more, or the place that the person regards as their main residence, or where the person has no other residence, the place they currently reside.' Apart from collecting a person's usual place of residence there is also a need in some collections to collect area of residence immediately prior to or after assistance is provided, or at some other point in time.

Comments:

Geographical location is reported using Statistical Local Area (SLA) to enable accurate aggregation of information to larger areas within the Australian Standard Geographical Classification (ASGC) (such as Statistical Subdivisions and Statistical Divisions) as well as detailed analysis at the SLA level. The use of SLA also allows analysis relating the data to information compiled by the Australian Bureau of Statistics on the demographic and other characteristics of the population of each SLA. Analyses facilitated by the inclusion of SLA information include:

- comparison of the use of services by persons residing in different geographical areas,
- characterisation of catchment areas and populations for establishments for planning purposes, and
- documentation of the provision of services to residents of States or Territories other than the State or Territory of the provider.

Assistance with activities

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – need for assistance with activities in a life area, code N
<i>METeOR identifier:</i>	320213
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The level of help and/or supervision a person requires (or would require if the person currently helping/supervising was not available) to perform tasks and actions in a specified life area, as represented by a code.
<i>Context:</i>	Human functioning and disability
<i>Data Element Concept:</i>	Person – need for assistance with activities in a life area

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001	
<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	0	Does not need help/supervision
	1	Sometimes needs help/supervision
	2	Always needs help/supervision
	3	Unable to do this task or action, even with assistance
<i>Supplementary values:</i>	8	Not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p>In the context of health, an activity is the execution of a task or action by an individual. Activity limitations are difficulties an individual may have in executing an activity.</p> <p>Activity limitation varies with the environment and is assessed in relation to a particular environment; the absence or presence of assistance, including aids and equipment, is an aspect of the environment.</p>
-----------------------	--

This value domain records the level of a person's need for help or supervision, in a specified domain, in their overall life. This means that the need for assistance may not be directly relevant to the health or community care service being provided.

Where a life area includes a range of examples, (e.g. domestic life includes cooking, cleaning and shopping), if a person requires assistance in any of the areas then the highest level of assistance should be recorded.

Where need for assistance varies markedly over time (e.g. episodic psychiatric conditions) please record the average level of assistance needed.

The presence of an activity limitation with a given domain is indicated by a non-zero response in this value domain. Activity is limited when an individual, in the context of a health condition, either has need for assistance in performing an activity in an expected manner, or cannot perform the activity at all.

CODE 0 is used when the person has no need for supervision or help and can undertake the activity independently.

CODE 1 is used when the person sometimes needs assistance to perform an activity.

CODE 2 is used when the person always needs assistance to undertake the activity and cannot do the activity without assistance.

CODE 3 is used when the person cannot do the activity even with assistance

CODE 8 is used when a person's need for assistance to undertake the activity is unknown or there is insufficient information to use codes 0-3.

CODE 9 is used where the need for help or supervision is due to the person's age. For example, Education for persons less than 5 years and work for persons less than 15 years.

Average available beds for hospital-in-the-home patients

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Occupied bed – hospital in the home care, average number of beds N[NNN.N]
<i>METeOR identifier:</i>	373955
<i>Registration status:</i>	Health, Standard 24/03/2009
<i>Definition:</i>	The number of beds used to care for hospital admitted patients in their place of residence as a substitute for hospital accommodation, calculated by dividing the number of days of hospital-in-the-home care reported for the period by the number of days in the period. Place of residence may be permanent or temporary.
Data Element Concept:	Occupied bed – hospital in the home care

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN.N]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Bed

Collection and usage attributes

<i>Guide for use:</i>	Average available beds, rounded to the nearest decimal or whole number.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Calculated by dividing the total hospital-in-the-home patient days by the number of days in the period, e.g. in a normal year, a hospital records 4000 hospital-in-the-home patient days - the average hospital-in-the-home beds would be $4000/365 = 11.0$.
<i>Collection methods:</i>	Beds exclusively or predominantly for overnight-stay admitted care, beds exclusively or predominantly for same-day admitted care, and non-special-care neonatal cots are collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted and that no available bed is counted more than once. A bed should first be assessed as available and then categorised according to its predominant use. For large hospitals a reconciliation of the sum of the counts for the four available bed types and an unduplicated establishment bed count is advisable.

Comments: This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Average available beds for overnight-stay patients

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Available bed – overnight-stay admitted care, average number of beds N[NNN.N]
<i>METeOR identifier:</i>	374151
<i>Registration status:</i>	Health, Standard 03/12/2008
<i>Definition:</i>	The number of beds available to provide overnight accommodation for patients (other than neonatal cots (non-special-care) and beds occupied by hospital-in-the-home patients), averaged over the counting period .
<i>Context:</i>	Public hospital establishments
<i>Data Element Concept:</i>	Available bed – overnight-stay admitted care

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN.N]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Bed

Collection and usage attributes

<i>Guide for use:</i>	Average available beds, rounded to the nearest decimal or whole number.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The number of available beds should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily). If so it should be collected at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.</p> <p>Inclusions: Both occupied and unoccupied beds are included in the count as they are deemed as available beds.</p> <p>The number of beds available to provide overnight accommodation is recorded, e.g. maternity ward beds are counted but beds in the delivery suite are not. However, if in a delivery suite patients are admitted, deliver and are discharged from the same bed, such beds should be included because these beds are available for use for overnight-stay patients.</p>
-----------------------	---

Collection methods:

Exclusions: surgical tables, recovery trolleys, delivery beds, discharge lounges for patients who have been formally discharged, medi-hotel beds, beds exclusively or predominantly for same-day admitted care, neonatal cots (non-special-care), hospital-in-the home beds, and beds exclusively or predominantly for non-admitted patients (e.g. emergency trolleys) or residential care. No adjustment should be made for contracted services, either provided by, or to this hospital.

Beds exclusively or predominantly for overnight-stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to its predominant use. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.

The assessment of availability must reflect the ability of the hospital to provide the necessary resources. This can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples.

Example 1: A large hospital, which conducts a daily bed count, has a ward containing 20 beds suitably equipped for overnight admitted patient care. The funding for this ward would allow an average of 15 beds to be staffed over the year. Provided demand is constant and there are no circumstances which prevent these beds from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available beds for this ward.

Example 2: A small hospital, which conducts a monthly bed count, is located in a summer holiday area and has 30 beds suitably equipped for overnight admitted patient care. It manages its resources in such a way that 30 beds are fully staffed during the four months from December to March, but only 15 beds are staffed during the remaining eight months from April to November. The annual average number of available beds is the average of the twelve counts – i.e. $((30 \text{ beds} \times 4 \text{ months}) + (15 \text{ beds} \times 8 \text{ months}) \text{ divided by } 12 \text{ counting periods}) = 20 \text{ beds}$.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 beds is closed for six months for a planned renovation. During this period a temporary 10 bed ward (B) is established and the necessary resources are provided. The annual average number of available beds for Ward A is the average of the twelve counts i.e. $(20 \text{ beds} \times 6 \text{ months}) + (0 \text{ beds} \times 6 \text{ months}) \text{ divided by } 12 \text{ counting periods} = 10 \text{ beds}$. The annual average number of available beds for Ward B is $(0 \text{ beds} \times 6 \text{ months}) + (10 \text{ beds} \times 6 \text{ months}) \text{ divided by } 12 \text{ counting periods} = 5 \text{ beds}$.

Example 4: A hospital conducts a daily bed count. A 20 bed ward is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 beds are available. So the average number of beds available for this ward in June is $((0 \text{ beds} \times 7 \text{ days}) + (20 \text{ beds} \times 23 \text{ days}) / 30 = 15.3$.

Comments:

This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Average available beds for residential mental health patients

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Available bed – residential mental health care, average number of beds N[NNN.N]
<i>METeOR identifier:</i>	373650
<i>Registration status:</i>	Health, Standard 03/12/2008
<i>Definition:</i>	The number of beds available in the specialised residential mental health services for overnight accommodation, averaged over the counting period.
Data Element Concept:	Available bed – residential mental health care

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN.N]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Bed

Collection and usage attributes

<i>Guide for use:</i>	Average available beds, rounded to the nearest decimal or whole number.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Residential mental health beds are available only if they are suitably located and equipped to provide residential mental health care and the necessary financial and human resources can be provided. Average available residential mental health beds are the average bed counts conducted during the year as required.</p> <p>Inclusions: Both occupied and unoccupied residential mental health beds are included.</p>
<i>Collection methods:</i>	<p>Specialised residential mental health care services should establish clear recording and reporting practices and criteria that ensure that each available residential mental health bed is counted and that no available residential mental health bed is counted more than once.</p> <p>The assessment of availability must reflect the ability of the specialised residential mental health care service to provide the necessary resources, and this can be significantly impacted by events such as a strike, clinical staff shortage, fire or renovation.</p>

This is illustrated by the following examples.

Example 1: A specialised residential mental health care service containing 20 residential mental health beds (A) is closed for several months, either for a planned renovation or in response to an unplanned event such as a fire. During this period a temporary 10 specialised residential mental health bed facility (B) is established and the necessary resources are provided. The specialised residential mental health care service would not report the residential mental health beds in facility A, but it would report the 10 residential mental health beds in facility B.

Example 2: A 20 bed specialised residential mental health service is closed during the first week of February because of a strike, but for the remaining three weeks of February it is fully staffed so that all 20 residential mental health beds can be occupied during those three weeks. So the average number of residential mental health beds available for this service in February is 15.

Comments:

This data element is necessary to provide an indicator of the capacity of the residential service.

Average available beds for same-day patients

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Available bed – same-day admitted care, average number of beds N[NNN.N]
<i>METeOR identifier:</i>	373966
<i>Registration status:</i>	Health, Standard 03/12/2008
<i>Definition:</i>	The number of beds, chairs or trolleys available to provide accommodation for same-day patients, averaged over the counting period.
Data Element Concept:	Available bed – same-day admitted care

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN.N]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Bed

Collection and usage attributes

<i>Guide for use:</i>	Average available beds, rounded to the nearest decimal or whole number.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The number of beds, chairs or trolleys available to provide accommodation for same-day patients is recorded. Same-day patients are accommodated in the following ways:</p> <ol style="list-style-type: none">1. Patients occupy a single bed or chair in a single location throughout their stay, e.g. dialysis or chemotherapy chair. In this situation the bed or chair is counted as a bed available for same-day patients.2. Patients occupy a trolley which is moved to different locations throughout their stay – e.g. endoscopy suite, where patients move from the same-day ward to a procedure room, onto a recovery room and back to the same-day ward. In this situation the trolley is counted as a bed available for same-day patients.3. Same-day patients are accommodated in a general ward after being transferred from another area of the hospital (e.g. Emergency, another ward, etc). In this situation the beds may be counted as either overnight-stay or same-day according to their predominant use.
-----------------------	---

The number of available same day beds should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily) at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.

Inclusions: Both occupied and unoccupied beds are included. Beds, chairs or trolleys available, exclusively or predominantly intended to accommodate same-day admitted care or treatment. This includes day surgery beds, dialysis, chemotherapy, electroconvulsive therapy (ECT) and dental chairs for admitted patients.

Exclusions: Exclude beds, chairs or trolleys designated exclusively for same-day non-admitted patient care or predominantly used by non-admitted patients (e.g. emergency trolleys), medical ambulatory care, discharge lounges for patients who have been formally discharged, medi-hotel beds, hospital-in-the-home, neonatal cots (non-special-care), and beds for overnight-stay patients (even where overnight beds are used for unplanned same-day episodes e.g. patients who die or abscond on the day of admission). No adjustment should be made for contracted services, either provided by, or to this hospital.

Collection methods:

Beds exclusively or predominantly for overnight-stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special-care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to the most appropriate accommodation category. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.

The assessment of availability must reflect the ability of the hospital to provide the necessary resources, and this can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples:

Example 1: A large hospital, which conducts a daily bed count, has a ward containing 20 beds suitably equipped for same-day admitted patient care. The funding for this ward would allow an average of 15 beds to be staffed over the year. Provided demand is constant and there are no circumstances which prevent these beds from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available beds for this ward.

Example 2: A hospital located in a summer holiday area, which conducts monthly bed counts, has 12 beds suitably equipped for same-day admitted patient care. It manages its resources in such a way that 12 beds are fully staffed during the four months from December to March, but only 9 beds are staffed during the remaining eight months from April to November. The annual average number of available beds is the average of the twelve monthly averages, i.e. $((12 \text{ beds} \times 4 \text{ months}) + (9 \text{ beds} \times 8 \text{ months})) \div 12 \text{ counting periods} = 120/12 = 10 \text{ beds}$.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 beds is closed for six months, for a planned renovation. During this period a temporary 10 bed ward (B) is established and the necessary resources are provided. The annual average number of available beds for Ward A is the average of the twelve counts, i.e. (20 beds X 6 months) + (0 beds X 6 months) divided by 12 counting periods = 120/12 = 10 beds. The annual average number of available beds for Ward B is (0 beds X 6 months) + (10 beds X 6 months) divided by 12 counting periods = 60/12 = 5 beds.

Example 4: A 20 bed ward is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 beds are available. So the average number of beds available for this ward in June is ((0 beds X 7 days) + (20 beds X 23 days) divided by 30 counting periods) = 460/30 = 15.3.

Comments:

This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Collection and usage attributes

<i>Guide for use:</i>	Average available beds, rounded to the nearest decimal or whole number.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Average available cots are the average of 12 monthly (or more frequent) counts of these available cots.</p> <p>The number of available cots should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily). If so, it should be collected at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.</p> <p>Inclusions: neonatal cots which are not in an intensive care facility approved by the Commonwealth Health Minister for the purpose of the provision of special care. They accommodate unqualified newborns and may also accommodate qualified newborns who do not need to be treated in such a facility (e.g. healthy second twin).</p> <p>Exclusions: cots in intensive care facilities approved by the Commonwealth Health Minister for the purpose of the provision of special care. Also exclude cots intended to accommodate older (not newborn) babies when they are admitted to hospital. (These cots are reported as available overnight beds.)</p>
-----------------------	--

Collection methods:

Beds exclusively or predominantly for overnight stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to its predominant use. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.

The assessment of availability must reflect the ability of the hospital to provide the necessary resources. This can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples.

Example 1: A large maternity hospital, which conducts a daily bed count, has a ward (not an approved intensive care facility) containing 20 cots used to accommodate newborns. The funding for this ward would allow an average of 15 cots to be staffed over the year.

Provided demand is constant and there are no circumstances which prevent these cots from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available cots for this ward.

Example 2: A maternity hospital, which conducts a monthly bed count, has a ward (not an approved intensive care facility) containing 30 cots used to accommodate newborns. It manages its resources in such a way that it is staffed for 30 cots for four months of the year and staffed for 24 cots during the remaining eight months. The annual average number of available cots is the average of the twelve counts - i.e. (30 cots x 4 months) + (24 cots x 8 months) divided by 12 counting periods = (120 + 192)/12 = 26 cots.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 cots is closed for six months, for a planned renovation. During this period a temporary ward (B) containing 10 cots is established and the necessary resources are provided. The annual average number of available cots in Ward A is the average of the twelve counts, i.e. (20 cots X 6 months) + (0 cots X 6 months) divided by 12 counting periods = 10 cots. The annual average number of available cots for Ward B is (0 cots X 6 months) + (10 cots X 6 months) divided by 12 counting periods = 5 cots.

Example 4: A hospital conducts a daily bed count. A ward containing 20 cots is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 cots are available. So the average number of cots available for this ward in June is ((0 cots X 7 days) + (20 cots X 23 days) = 460/30 = 15.3.

Comments:

This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Collection and usage attributes

<i>Guide for use:</i>	CODE 01 No intervention Refers to no intervention taken with regard to the behaviour-related risk factor intervention-purpose.
	CODE 02 Information and education (not including written regimen) Refers to where there is no treatment provided to the patient for a behaviour-related risk factor intervention-purpose other than information and education.

CODE 03 Counselling

Refers to any method of individual or group counselling directed towards the behaviour-related risk factor intervention-purpose. This code excludes counselling activities that are part of referral options as defined in code 05 and 06.

CODE 04 Pharmacotherapy

Refers to pharmacotherapies that are prescribed or recommended for the management of the behaviour-related risk factor intervention-purpose.

CODE 05 Referral provided to a health professional

Refers to a referral to a health professional who has the expertise to assist the patient manage the behaviour-related risk factor intervention-purpose.

CODE 06 Referral to a community program, support group or service

Refers to a referral to community program, support group or service that has the expertise and resources to assist the patient manage the behaviour-related risk factor intervention-purpose.

CODE 07 Written regimen provided

Refers to the provision of a written regimen (nutrition plan, exercise prescription, smoking contract) given to the patient to assist them with the management of the behaviour-related risk factor intervention-purpose.

CODE 08 Surgery

Refers to a surgical procedure undertaken to assist the patient with the management of the behaviour-related risk factor intervention-purpose.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Plurality of a pregnancy is determined by the number of live births or by the number of fetuses that remain in utero at 20 weeks gestation and that are subsequently born separately. In multiple pregnancies, or if gestational age is unknown, only live births of any birthweight or gestational age, or fetuses weighing 400 g or more, are taken into account in determining plurality. Fetuses aborted before 20 completed weeks or fetuses compressed in the placenta at 20 or more weeks are excluded.
<i>Collection methods:</i>	This data should be collected routinely for persons aged 28 days or less.

Value	Meaning				
999	Not stated/inadequately described				
<i>Unit of measure:</i>	Millimetre of mercury (mmHg)				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The diastolic pressure is recorded as phase V Korotkoff (disappearance of sound) however phase IV Korotkoff (muffling of sound) is used if the sound continues towards zero but does not cease.</p> <p>If Blood pressure - diastolic is not collected or not able to be collected, code 999.</p>
<i>Collection methods:</i>	<p>Measurement protocol for resting blood pressure:</p> <p>The diastolic blood pressure is one component of a routine blood pressure measurement (i.e. systolic/diastolic) and reflects the minimum pressure to which the arteries are exposed.</p> <ul style="list-style-type: none">• The patient should be relaxed and seated, preferably for several minutes, (at least 5 minutes). Ideally, patients should not take caffeine-containing beverages or smoke for two hours before blood pressure is measured.• Ideally, patients should not exercise within half an hour of the measurement being taken (National Nutrition Survey User’s Guide).• Use a mercury sphygmomanometer. All other sphygmomanometers should be calibrated regularly against mercury sphygmomanometers to ensure accuracy.

- Bladder length should be at least 80%, and width at least 40% of the circumference of the mid-upper arm. If the velcro on the cuff is not totally attached, the cuff is probably too small.
- Wrap cuff snugly around upper arm, with the centre of the bladder of the cuff positioned over the brachial artery and the lower border of the cuff about 2 cm above the bend of the elbow.
- Ensure cuff is at heart level, whatever the position of the patient.
- Palpate the radial pulse of the arm in which the blood pressure is being measured.
- Inflate cuff to the pressure at which the radial pulse disappears and note this value. Deflate cuff, wait 30 seconds, and then inflate cuff to 30 mm Hg above the pressure at which the radial pulse disappeared.
- Deflate the cuff at a rate of 2-3 mm Hg/beat (2-3 mm Hg/sec) or less.
- Recording the diastolic pressure use phase V Korotkoff (disappearance of sound). Use phase IV Korotkoff (muffling of sound) only if sound continues towards zero but does not cease. Wait 30 seconds before repeating the procedure in the same arm. Average the readings.
- If the first two readings differ by more than 4 mmHg diastolic or if initial readings are high, take several readings after five minutes of quiet rest.

Comments:

The pressure head is the height difference a pressure can raise a fluid's equilibrium level above the surface subjected to pressure. (Blood pressure is usually measured as a head of Mercury, and this is the unit of measure nominated for this metadata item.)

The current (2002) definition of hypertension is based on the level of blood pressure above which treatment is recommended, and this depends on the presence of other risk factors, e.g. age, diabetes etc. (NHF 1999 Guide to Management of Hypertension).

Value	Meaning				
999	Not stated/inadequately described				
<i>Unit of measure:</i>	Millimetre of mercury (mmHg)				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	For recording the systolic reading, use phase I Korotkoff (the first appearance of sound). If Blood pressure - systolic is not collected or not able to be collected, code 999.
<i>Collection methods:</i>	<p>Measurement protocol for resting blood pressure:</p> <p>The systolic blood pressure is one component of a routine blood pressure measurement (i.e. systolic/diastolic) and reflects the maximum pressure to which the arteries are exposed.</p> <ul style="list-style-type: none">• The patient should be relaxed and seated, preferably for several minutes, (at least 5 minutes). Ideally, patients should not take caffeine-containing beverages or smoke for two hours before blood pressure is measured.• Ideally, patients should not exercise within half an hour of the measurement being taken (National Nutrition Survey User's Guide).• Use a mercury sphygmomanometer. All other sphygmomanometers should be calibrated regularly against mercury sphygmomanometers to ensure accuracy.• Bladder length should be at least 80%, and width at least 40% of the circumference of the mid-upper arm. If the Velcro on the cuff is not totally attached, the cuff is probably too small.

- Wrap cuff snugly around upper arm, with the centre of the bladder of the cuff positioned over the brachial artery and the lower border of the cuff about 2 cm above the bend of the elbow.
- Ensure cuff is at heart level, whatever the position of the patient.
- Palpate the radial pulse of the arm in which the blood pressure is being measured.
- Inflate cuff to the pressure at which the radial pulse disappears and note this value. Deflate cuff, wait 30 seconds, and then inflate cuff to 30 mm Hg above the pressure at which the radial pulse disappeared.
- Deflate the cuff at a rate of 2-3 mm Hg/beat (2-3 mm Hg/sec) or less.
- For recording the systolic reading, use phase I Korotkoff (the first appearance of sound). Wait 30 seconds before repeating the procedure in the same arm. Average the readings. If the first two readings differ by more than 6 mm Hg systolic or if initial readings are high, take several readings after five minutes of quiet rest.

Comments:

The pressure head is the height difference a pressure can raise a fluid's equilibrium level above the surface subjected to pressure. (Blood pressure is usually measured as a head of Mercury, and this is the unit of measure nominated for this metadata item.)

21	Multiple injuries (involving more than one bodily location)
22	Bodily location not required

Data element attributes

Collection and usage attributes

Guide for use:

If the full International Classification of Diseases - Tenth Revision - Australian Modification code is used to code the injury, this metadata item is not required (see metadata items Principal diagnosis and Additional diagnosis).

If any code from 01 to 12 or 26 to 29 in the metadata item Nature of main injury has been selected, the body region affected by that injury must be specified.

Select the category that best describes the location of the injury. If two or more categories are judged to be equally appropriate, select the one that comes first on the code list. A major injury, if present, should always be coded rather than a minor injury. If a major injury has been sustained (e.g. a fractured femur), along with one or more minor injuries (e.g. some small abrasions), the major injury should be coded in preference to coding 'multiple injuries'. As a general guide, an injury which, on its own, would be unlikely to have led to the attendance may be regarded as 'minor'. Bodily location of main injury is not required with other nature of main injury codes (code 22 may be used as a filler to indicate that a specific body region code is not required).

Comments:

The injury diagnosis is necessary for purposes including epidemiological research, casemix studies and planning. The nature of main injury together with the bodily location of the main injury indicates the diagnosis.

This metadata item is related to the ICD-10-AM injury and poisoning classification. However, coding to the full ICD-10-AM injury and poisoning classification (see metadata item Principal diagnosis) is not available in most settings where basic injury surveillance is undertaken. This metadata item, in combination with the metadata item Nature of main injury is a practicable alternative. Data coded to the full ICD-10-AM codes can be aggregated to match this item, facilitating data comparison. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

Body function

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – body function, code (ICF 2001) AN[NNNN]
<i>Synonymous names:</i>	Body function code
<i>METeOR identifier:</i>	320141
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The physiological or psychological function of a person's body system, as represented by a code.
Data Element Concept:	Person – body function

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	AN[NNNN]
<i>Maximum character length:</i>	6

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p>Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both Exercise tolerance functions (3 digit level) and 'fatigability' (4-digit level) as the former includes the latter.</p> <p>The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with <i>Impairment extent code N</i> will use the codes as indicated.</p> <p>CODE b1 Mental functions CODE b2 Sensory functions and pain CODE b3 Voice and speech functions CODE b4 Functions of the cardiovascular, haematological, immunological and respiratory systems CODE b5 Functions of the digestive, metabolic and the endocrine system CODE b6 Genitourinary and reproductive functions CODE b7 Neuromusculoskeletal and movement-related functions CODE b8 Functions of the skin and related structures</p>
-----------------------	--

Data collected at this level will provide a general description of the structures and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values together, with definitions is listed in the *Body Functions* component of the ICF.

An example of a value domain at the 3 digit level from the Sensory functions and pain chapter may include:

CODE b210 Seeing functions
CODE b230 Hearing functions
CODE b235 Vestibular functions
CODE b250 Taste functions
CODE b255 Smell functions
CODE b260 Proprioceptive functions
CODE b265 Touch functions
CODE b270 Sensory functions related to temperature and other stimuli
CODE b279 Additional sensory functions, other specified and unspecified

An example of a value domain at the 4 digit level from the body function component may include:

CODE b1300 Energy level
CODE b1400 Sustaining attention
CODE b1442 Retrieval of memory
CODE b1521 Regulation of emotion
CODE b1641 Organization and planning

The prefix *b* denotes the domains within the component of *Body Functions*.

Data element attributes

Collection and usage attributes

Guide for use:

This data element can be used to record positive or neutral body function, as well as impairment of body function when used in conjunction with the metadata item Person—extent of impairment of body function, code (ICF 2001)N.

Where multiple body functions or impairments of body functions are recorded, the following prioritising system should be useful.

- The first recorded body function or impairment of body function is the one having the greatest impact on the individual.
- Second and subsequent body function or impairment of body function is also of relevance to the individual.

Body mass index—adult (measured)

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Adult – body mass index (measured), ratio NN[N].N[N]
<i>METeOR identifier:</i>	270084
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	A measure of an adult's weight (body mass) relative to height used to assess the extent of weight deficit or excess where height and weight have been measured.
Data Element Concept:	Adult – body mass index

Value domain attributes

Representational attributes

<i>Representation class:</i>	Ratio	
<i>Data type:</i>	Number	
<i>Format:</i>	NN[N].N[N]	
<i>Maximum character length:</i>	5	
<i>Supplementary values:</i>	Value	Meaning
	888.8	Unknown
	999.9	Not reported

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Formula: BMI = weight (kg) divided by height (m) squared. Body mass index is a continuous variable. Code body mass index to one or two decimal places (i.e. 99.99 or 99.9). If any component necessary for its calculation (i.e. weight or height for adults) is unknown or has not been collected, code to 888.8, 999.9.
<i>Collection methods:</i>	NN.NN for BMI calculated from measured height and weight. BMI should be derived after data entry of weight and height. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.
<i>Comments:</i>	This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference such as the United States Centers for Disease Control 2000 BMI-for-age chart be used for in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th percentile would be classified as overweight, while a BMI greater

than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults.

BMI is relatively easy to determine, and has been validated against more direct measures of adiposity such as Magnetic Resonance Imaging and Dual X-ray Absorptiometry.

BMI is a low cost technique, with low respondent and investigator burden. In addition, it offers low inter-observer and intra-observer error, therefore offering good reliability.

Overweight and obesity, as defined by the World Health Organisation (WHO) for the interpretation of BMI (WHO 2000), are exceedingly common in Australia and their prevalence is increasing.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles a sample size of at least 200 is recommended for each group for which the centiles are being specified.

Body mass index can be calculated from measured height and weight, or self-reported height and weight, however for children and adolescents, self-reported or parentally reported data should be used cautiously if at all.

For adults, body mass index tends to be underestimated when based on self-reported, rather than measured, height and weight. This is due to the fact that, on average, height tends to be overestimated and weight tends to be underestimated when self-reported by respondents.

There are many individuals for whom BMI is an inappropriate measure of body fatness. These are individuals whose high body mass is due to excess muscle rather than fat (e.g. body builders or others in whom the level of physical activity promotes an increase in muscle mass); or in those with osteoporosis who will have a lower than usual BMI; or those who have a different body build (e.g. individuals with unusually long or short legs or a different body fat distribution) (WHO Expert Committee 1995).

This is particularly important when assessing individuals but

should also be taken into account in interpreting data from populations in which there are sub-groups with genetic or environmental differences in body build, composition, skeletal proportions or body fat distribution. As such, both BMI and a measure of fat distribution (waist circumference or waist: hip ratio) are important in calculating the risk of obesity comorbidities.

Epidemiological research shows that there is a strong association between BMI and health risk. Excess adipose tissue in adults is associated with excess morbidity and mortality from conditions such as hypertension, unfavourable blood lipid concentrations, diabetes mellitus, coronary heart disease, some cancers, gall bladder disease, and osteoarthritis. It may also lead to social and economic disadvantage as well as psychosocial problems. It is a major public health issue in most industrialised societies.

Thinness (low BMI) is also an indicator of health risk, often being associated with general illness, anorexia, cigarette smoking, drug addiction and alcoholism. Low BMI is consistently associated with increased risk of osteoporosis and fractures in the elderly.

<i>Maximum character length:</i>	5	
<i>Supplementary values:</i>	Value	Meaning
	888.8	Unknown
	999.9	Not reported

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	NN.N for BMI calculated from either self-reported height and/or self-reported weight. BMI calculated from measured height and weight should be distinguished from BMI calculated from self-reported height and/or weight. When either self-reported height or self-reported weight is used in the calculation, BMI should be recorded as self-reported BMI. Self-reported or parentally reported height and weight for children and adolescents should be used cautiously if at all. BMI should be derived after the data entry of weight and height. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.
<i>Comments:</i>	This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference such as the United States Centers for Disease Control 2000 BMI-for-age chart be used for in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th

percentile would be classified as overweight, while a BMI greater than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults.

BMI is relatively easy to determine, and has been validated against more direct measures of adiposity such as Magnetic Resonance Imaging and Dual X-ray Absorptiometry.

BMI is a low cost technique, with low respondent and investigator burden. In addition, it offers low inter-observer and intra-observer error, therefore offering good reliability.

Overweight and obesity, as defined by the World Health Organisation (WHO) for the interpretation of BMI (WHO 2000), are exceedingly common in Australia and their prevalence is increasing.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles a sample size of at least 200 is recommended for each group for which the centiles are being specified.

Body mass index can be calculated from measured height and weight, or self-reported height and weight, however for children and adolescents, self-reported or parentally reported data should be used cautiously if at all.

For adults, body mass index tends to be underestimated when based on self-reported, rather than measured, height and weight. This is due to the fact that, on average, height tends to be overestimated and weight tends to be underestimated when self-reported by respondents.

There are many individuals for whom BMI is an inappropriate measure of body fatness. These are individuals whose high body mass is due to excess muscle rather than fat (e.g. body builders or others in whom the level of physical activity promotes an increase in muscle mass); or in those with osteoporosis who will have a lower than usual BMI; or those who have a different body build (e.g. individuals with unusually long or short legs or a different body fat distribution) (WHO Expert Committee 1995).

This is particularly important when assessing individuals but should also be taken into account in interpreting data from populations in which there are sub-groups with genetic or environmental differences in body build, composition, skeletal proportions or body fat distribution. As such, both BMI and a measure of fat distribution (waist circumference or waist: hip ratio) are important in calculating the risk of obesity comorbidities.

Epidemiological research shows that there is a strong association between BMI and health risk. Excess adipose tissue in adults is associated with excess morbidity and mortality from conditions such as hypertension, unfavourable blood lipid concentrations, diabetes mellitus, coronary heart disease, some cancers, gall bladder disease, and osteoarthritis. It may also lead to social and economic disadvantage as well as psychosocial problems. It is a major public health issue in most industrialised societies.

Thinness (low BMI) is also an indicator of health risk, often being associated with general illness, anorexia, cigarette smoking, drug addiction and alcoholism. Low BMI is consistently associated with increased risk of osteoporosis and fractures in the elderly.

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	NN.NN for BMI calculated from measured height and weight. BMI should be derived after the data entry of weight and height. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.
<i>Comments:</i>	This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference such as the United States Centers for Disease Control 2000 BMI-for-age chart be used for in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th percentile would be classified as overweight, while a BMI greater than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults. BMI is relatively easy to determine, and has been validated against more direct measures of adiposity such as Magnetic Resonance Imaging and Dual X-ray Absorptiometry.

BMI is a low cost technique, with low respondent and investigator burden. In addition, it offers low inter-observer and intra-observer error, therefore offering good reliability.

Overweight and obesity, as defined by the World Health Organisation (WHO) for the interpretation of BMI (WHO 2000), are exceedingly common in Australia and their prevalence is increasing.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles a sample size of at least 200 is recommended for each group for which the centiles are being specified.

Body mass index can be calculated from measured height and weight, or self-reported height and weight, however for children and adolescents, self-reported or parentally reported data should be used cautiously if at all.

For adults, body mass index tends to be underestimated when based on self-reported, rather than measured, height and weight. This is due to the fact that, on average, height tends to be overestimated and weight tends to be underestimated when self-reported by respondents.

There are many individuals for whom BMI is an inappropriate measure of body fatness. These are individuals whose high body mass is due to excess muscle rather than fat (e.g. body builders or others in whom the level of physical activity promotes an increase in muscle mass); or in those with osteoporosis who will have a lower than usual BMI; or those who have a different body build (e.g. individuals with unusually long or short legs or a different body fat distribution) (WHO Expert Committee 1995).

This is particularly important when assessing individuals but should also be taken into account in interpreting data from populations in which there are sub-groups with genetic or environmental differences in body build, composition, skeletal proportions or body fat distribution. As such, both BMI and a measure of fat distribution (waist circumference or waist: hip ratio) are important in calculating the risk of obesity comorbidities.

Epidemiological research shows that there is a strong association between BMI and health risk. Excess adipose tissue in adults is associated with excess morbidity and mortality from conditions such as hypertension, unfavourable blood lipid concentrations, diabetes mellitus, coronary heart disease, some cancers, gall bladder disease, and osteoarthritis. It may also lead to social and economic disadvantage as well as psychosocial problems. It is a major public health issue in most industrialised societies.

Thinness (low BMI) is also an indicator of health risk, often being associated with general illness, anorexia, cigarette smoking, drug addiction and alcoholism. Low BMI is consistently associated with increased risk of osteoporosis and fractures in the elderly.

Collection and usage attributes

<i>Guide for use:</i>	<p>Adults:</p> <p>Body mass index for adults cannot be calculated if components necessary for its calculation (weight or height) is unknown or has not been collected (i.e. is coded to 888.8 or 999.9).</p> <p>BMI for adults is categorised according to the range it falls within as indicated by codes 1.1, 1.2, 2.1, 2.2, 3.1, 3.2, 3.3 or 9.9. For consistency, when the sample includes children and adolescents, adults can be analysed under the broader categories of 1, 2, 3 or 9 as used for categorising children and adolescents.</p> <p>Children/adolescents:</p> <p>Body mass index for children and adolescents aged 2 to 17 years cannot be calculated if components necessary for its calculation (date of birth, sex, weight or height) is unknown or has not been collected (i.e. is coded to 888.8, 999.9 or 9).</p>
-----------------------	--

Self-reported or parentally reported height and weight for children and adolescents should be used cautiously if at all.

To determine overweight and obesity in children and adolescents, compare the derived BMI against those recorded for the relevant age and sex of the subject to be classified, against Table 1: Classification of BMI for children and adolescents, based on BMI cut-points developed by Cole et al (see below). For example, an 11 year old boy with a BMI of 21 would be considered overweight (i.e. coded as 2), or a 7 year old girl with a BMI of 17.5 would be considered not overweight or obese (i.e. coded as 1).

Using this method, children and adolescents can only be coded as 1, 2, 3 or 9.

Collection methods:

Use N for BMI category determined (1, 2, 3 or 9) for persons (children and adolescents) aged 2 to 17 years.

Use N.N for BMI category determined (1.1, 1.2, 2.1, 2.2, 3.1, 3.2, 3.3 or 9.9) for persons aged 18 years or older.

Standard definitions of overweight and obesity in terms of BMI are used to derive age-specific and age-adjusted indicators of overweight and obesity for reporting progress towards National public health policy .

Comments:

This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference chart in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th percentile would be classified as overweight, while a BMI greater than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults.

BMI can be considered to provide the most useful, albeit crude, population-level measure of obesity. The robust nature of the measurements and the widespread routine inclusion of weights and heights in clinical and population health surveys mean that a more selective measure of adiposity, such as skinfold thickness measurements, provides additional rather than primary information. BMI can be used to estimate the prevalence of obesity within a population and the risks associated with it, but does not, however, account for the wide variation in the nature of obesity between different individuals and populations (WHO 2000).

BMI values for adults are age-independent and the same for both sexes.

However, BMI values for children and adolescents aged 2 to 17 years are age and sex specific and are classified by comparing

against the above table, Table 1: Classification of BMI for children and adolescents.

For adults and children and adolescents BMI may not correspond to the same degree of fatness in different populations due, in part, to differences in body proportions. The classification table shows a simplistic relationship between BMI and the risk of comorbidity, which can be affected by a range of factors, including the nature of the diet, ethnic group and activity level. The risks associated with increasing BMI are continuous and graded and begin at a BMI of 25 (or equivalent to 25 for children and adolescents). The interpretation of BMI grades in relation to risk may differ for different populations. Both BMI and a measure of fat distribution (waist circumference or waist: hip ratio in adults) are important in calculating the risk of obesity comorbidities.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous Status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Methods used to establish cut-off points for overweight have been arbitrary and, as a result, cut-off points vary between countries. The data are derived mainly from studies of mortality and morbidity risk performed in people living in western Europe or the United States of America, and cut-off points for BMI as an indicator of adiposity and risk in populations who differ in body build and genetic disposition are likely to vary.

Caution is required in relation to BMI cut-off points when used for different ethnic groups because of limited outcome data for some ethnic groups, e.g. Aboriginal and Torres Strait Islander peoples. As with overweight the cut-off points for a given level of risk are likely to vary with body build, genetic background and physical activity.

The classification above is different to ones that have been used in the past and it is important that in any trend analysis consistent definitions are used.

BMI should not be rounded before categorisation to the classification above.

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept disability and gives an indication of the experience of disability for a person.</p> <p>Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both 'Skin and related structures' (chapter level) and 'Structure of nails' (3 digit level) as the former includes the latter.</p> <p>The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with respective qualifiers (<i>Impairment extent code N, Impairment nature code N, Impairment location code N</i>) will use the codes as indicated.</p> <p>CODE s1 Structures of the nervous system CODE s2 The eye, ear and related structures CODE s3 Structures involved in voice and speech CODE s4 Structures of the cardiovascular, immunological and respiratory systems CODE s5 Structures related to the digestive, metabolic and endocrine systems CODE s6 Structures related to the genitourinary and reproductive systems CODE s7 Structures related to movement</p>
-----------------------	--

CODE s8 Skin and related structures

Data collected at this level will provide a general description of the structures and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values together with definitions is listed in the [Body Structures](#) component of the ICF.

An example of a value domain at the 3 digit level from the Structures of the nervous system chapter may include:

CODE s110 Structure of the brain
CODE s120 Spinal cord and related structures
CODE s130 Structure of the meninges
CODE s140 Structure of sympathetic nervous system
CODE s150 Structure of parasympathetic nervous system
CODE s198 Structure of the nervous system, other specified
CODE s199 Structure of the nervous system, unspecified

An example of a value domain at the 4 digit level from the Structures related to movement chapter may include:

CODE s7300 Structure of upper arm
CODE s7301 Structure of forearm
CODE s7302 Structure of hand
CODE s7500 Structure of thigh
CODE s7501 Structure of lower leg
CODE s7502 Structure of ankle and foot
CODE s7600 Structure of vertebral column

The prefix *s* denotes the domains within the component of *Body Structures*.

Data element attributes

Collection and usage attributes

Guide for use:

This data element consists of a single, neutral list of body structures that can be used to record positive or neutral body function. In conjunction with *Impairment extent code N*, it enables the provision of information about the presence and extent of impairment for any given body structures; with *Impairment nature code N*, the provision of information about the nature of the impairment for given body functions; and *Impairment location code N*, the location of the impairment for given body functions.

Where multiple body structures or **impairments of body structures** are recorded, the following prioritising system should be useful:

- The first recorded body structure or impairment of body function is the one having the greatest impact on the individual.
- Second and subsequent body structure or impairment of body function is also of relevance to the individual.

Cancer staging—M stage code

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person with cancer – distant metastasis status, M stage (UICC TNM Classification of Malignant Tumours, 6th edn) code XX
<i>METeOR identifier:</i>	341300
<i>Registration status:</i>	Health, Standard 06/03/2009
<i>Definition:</i>	Absence or presence of distant metastasis at the time of diagnosis of the primary cancer, as represented by a code.
Data Element Concept:	Person with cancer – distant metastasis status

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Union against Cancer (UICC) TNM Classification of Malignant Tumours 6th edition	
<i>Representation class:</i>	Code	
<i>Data type:</i>	String	
<i>Format:</i>	XX	
<i>Maximum character length:</i>	2	
<i>Supplementary values:</i>	Value	Meaning
	88	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	Valid M codes from the current edition of the UICC TNM Classification of Malignant Tumours. Refer to the TNM Supplement: A Commentary on Uniform Use, 3rd Edition for coding rules.
-----------------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	TNM staging applies to solid tumours excluding brain tumours. Choose the lower (less advanced) M category when there is any uncertainty.
<i>Collection methods:</i>	From information provided by the treating doctor and recorded on the patient's medical record.
<i>Comments:</i>	Cancer prognosis and survival can be related to the extent of the disease at diagnosis. Survival rates are generally higher if the disease is localised to the organ of origin compared with cases in which the tumour has spread beyond the primary site. Staging systems seek to classify patients having a similar prognosis into groups or stages. TNM staging is an internationally agreed staging classification system based on the

anatomical site of the primary tumour and its extent of spread. The T component refers to the size of the tumour and whether or not it has spread to surrounding tissues. The N component describes the presence or absence of tumour in regional lymph nodes. The M component refers to the presence or absence of tumour at sites distant from the primary site.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.</p> <p>Depreciation expenses are to be reported in millions to the nearest 100,000 e.g. \$4,064,000 should be reported as \$4.1 million.</p> <p>When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).</p> <p>Depreciation represents the expensing of a long-term asset over its useful life and is related to the basic accounting principle of matching revenue and expenses for the financial period.</p> <p>Depreciation charges for the current financial year only should be shown as expenditure. Where intangible assets are amortised (such as with some private hospitals) this should also be included in recurrent expenditure.</p>
<i>Collection methods:</i>	<p>Depreciation expenses are to be reported for the <i>Health industry relevant organisation type</i> and <i>Type of health and health related functions</i> data elements.</p> <p><i>Health industry relevant organisation type</i></p>

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments:

In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 Angiotensin converting enzyme (ACE) inhibitors Use this code for ACE inhibitors (captopril, enalapril, fosinopril, lisinopril, perindopril, quinapril, ramipril andtrandolapril).</p> <p>CODE 2 Angiotensin II (A2) receptor blockers Use this code for Angiotensin II receptor blockers (candesartan, eprosartan, irbesartan and telmisartan).</p> <p>CODE 3 Beta blockers Use this code for Beta blockers (atenolol, carvedilol, labetalol, metoprolol, oxprenolol, pindolol, propranolol and sotalol).</p> <p>CODE 4 Calcium antagonists Use this code for Calcium antagonists (amlodipine, diltiazem, felodipine, lercanidipine, nifedipine and verapamil).</p> <p>CODE 8 None of the above This code is used when none of the listed medications is being taken by the person.</p>
-----------------------	--

CODE 9 Not stated/inadequately described

This code should only be used in situations where it is not practicable to ask the questions.

Collection methods:

The person should be asked a series of questions about any current medication for a cardiovascular condition as follows:

Are you currently taking any medication for a cardiovascular condition?

Yes No

If the person answers 'NO', then code 8 should be applied.

If the person answers 'YES', then ask which one(s) (from the list of drugs in the Guide for use).

Ace Inhibitors Yes No

Angiotensin II receptor blockers Yes No

Beta blockers Yes No

Calcium antagonists Yes No

The appropriate code should be recorded for each type of medication currently in use.

Data element attributes

Collection and usage attributes

Collection methods:

A person may be taking one or more of the following medications for a cardiovascular condition. Therefore more than one code may be reported.

9.0	Organ procurement - posthumous (Other care)																																		
10.0	Hospital boarder (Other care)																																		

Collection and usage attributes

Guide for use:

Persons with mental illness may receive any one of the care types (except newborn and organ procurement). Classification depends on the principal clinical intent of the care received.

Admitted care can be one of the following:

CODE 1.0 Acute care (Admitted care)

Acute care is care in which the clinical intent or treatment goal is to:

- manage labour (obstetric)
- cure illness or provide definitive treatment of injury
- perform surgery
- relieve symptoms of illness or injury (excluding palliative care)
- reduce severity of an illness or injury
- protect against exacerbation and/or complication of an illness and/or injury which could threaten life or normal function
- perform diagnostic or therapeutic procedures.

CODE 2.0 Rehabilitation care (Admitted care)

Rehabilitation care is care in which the clinical intent or treatment goal is to improve the functional status of a patient with an impairment, disability or handicap. It is usually evidenced by a multi-disciplinary rehabilitation plan comprising negotiated goals and indicative time frames which are evaluated by a periodic assessment using a recognised functional assessment measure. It includes care provided:

- in a designated rehabilitation unit (code 2.1), or
- in a designated rehabilitation program, or in a psychiatric rehabilitation program as designated by the state health authority for public patients in a recognised hospital, for private patients in a public or private hospital as approved by a registered health benefits organisation (code 2.2), or
- under the principal clinical management of a rehabilitation physician or, in the opinion of the treating doctor, when the principal clinical intent of care is rehabilitation (code 2.3).

Optional:

CODE 2.1 Rehabilitation care delivered in a designated unit (optional)

A designated rehabilitation care unit is a dedicated ward or unit (and can be a stand-alone unit) that receives identified funding for rehabilitation care and/or primarily delivers rehabilitation care.

CODE 2.2 Rehabilitation care according to a designated program (optional)

In a designated rehabilitation care program, care is delivered by a specialised team of staff who provide rehabilitation care to

patients in beds that may or may not be dedicated to rehabilitation care. The program may, or may not be funded through identified rehabilitation care funding. Code 2.1 should be used instead of code 2.2 if care is being delivered in a designated rehabilitation care program and a designated rehabilitation care unit.

CODE 2.3 Rehabilitation care is the principal clinical intent (optional)

Rehabilitation as principal clinical intent (code 2.3) occurs when the patient is primarily managed by a medical practitioner who is a specialist in rehabilitation care or when, in the opinion of the treating medical practitioner, the care provided is rehabilitation care even if the doctor is not a rehabilitation care specialist. The exception to this is when the medical practitioner is providing care within a designated unit or a designated program, in which case code 2.1 or 2.2 should be used, respectively.

Code 3.0 Palliative care

Palliative care is care in which the clinical intent or treatment goal is primarily quality of life for a patient with an active, progressive disease with little or no prospect of cure. It is usually evidenced by an interdisciplinary assessment and/or management of the physical, psychological, emotional and spiritual needs of the patient; and a grief and bereavement support service for the patient and their carers/family. It includes care provided:

- in a palliative care unit (code 3.1); or
- in a designated palliative care program (code 3.2); or
- under the principal clinical management of a palliative care physician or, in the opinion of the treating doctor, when the principal clinical intent of care is palliation (code 3.3).

Optional:

CODE 3.1 Palliative care delivered in a designated unit (optional)

A designated palliative care unit is a dedicated ward or unit (and can be a stand-alone unit) that receives identified funding for palliative care and/or primarily delivers palliative care.

CODE 3.2 Palliative care according to a designated program (optional)

In a designated palliative care program, care is delivered by a specialised team of staff who provide palliative care to patients in beds that may or may not be dedicated to palliative care. The program may, or may not be funded through identified palliative care funding. Code 3.1 should be used instead of code 3.2 if care is being delivered in a designated palliative care program and a designated palliative care unit.

CODE 3.3 Palliative care is the principal clinical intent (optional)

Palliative care as principal clinical intent occurs when the patient is primarily managed by a medical practitioner who is a specialist in palliative care or when, in the opinion of the treating medical practitioner, the care provided is palliative care even if the doctor

is not a palliative care specialist. The exception to this is when the medical practitioner is providing care within a designated unit or a designated program, in which case code 3.1 or 3.2 should be used, respectively. For example, code 3.3 would apply to a patient dying of cancer who was being treated in a geriatric ward without specialist input by palliative care staff.

CODE 4.0 Geriatric evaluation and management

Geriatric evaluation and management is care in which the clinical intent or treatment goal is to maximise health status and/or optimise the living arrangements for a patient with multi-dimensional medical conditions associated with disabilities and psychosocial problems, who is usually (but not always) an older patient. This may also include younger adults with clinical conditions generally associated with old age. This care is usually evidenced by multi-disciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames. Geriatric evaluation and management includes care provided:

- in a geriatric evaluation and management unit; or
- in a designated geriatric evaluation and management program; or
- under the principal clinical management of a geriatric evaluation and management physician or,
- in the opinion of the treating doctor, when the principal clinical intent of care is geriatric evaluation and management.

CODE 5.0 Psychogeriatric care

Psychogeriatric care is care in which the clinical intent or treatment goal is improvement in health, modification of symptoms and enhancement in function, behaviour and/or quality of life for a patient with an age-related organic brain impairment with significant behavioural or late onset psychiatric disturbance or a physical condition accompanied by severe psychiatric or behavioural disturbance. The care is usually evidenced by multi-disciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames. It includes care provided:

- in a psychogeriatric care unit;
- in a designated psychogeriatric care program; or
- under the principal clinical management of a psychogeriatric physician or,
- in the opinion of the treating doctor, when the principal clinical intent of care is psychogeriatric care.

CODE 6.0 Maintenance care

Maintenance care is care in which the clinical intent or treatment goal is prevention of deterioration in the functional and current health status of a patient with a disability or severe level of functional impairment. Following assessment or treatment the patient does not require further complex assessment or

stabilisation, and requires care over an indefinite period. This care includes that provided to a patient who would normally receive care in another setting, e.g. at home, or in a residential aged care service, by a relative or carer, that is unavailable in the short term.

CODE 7.0 Newborn care

Newborn care is initiated when the patient is born in hospital or is nine days old or less at the time of admission. Newborn care continues until the care type changes or the patient is separated:

- patients who turn 10 days of age and do not require clinical care are separated and, if they remain in the hospital, are designated as boarders
- patients who turn 10 days of age and require clinical care continue in a newborn episode of care until separated
- patients aged less than 10 days and not admitted at birth (e.g. transferred from another hospital) are admitted with newborn care type
- patients aged greater than 9 days not previously admitted (e.g. transferred from another hospital) are either boarders or admitted with an acute care type
- within a newborn episode of care, until the baby turns 10 days of age, each day is either a qualified or unqualified day
- a newborn is qualified when it meets at least one of the criteria detailed in **Newborn qualification status**.

Within a newborn episode of care, each day after the baby turns 10 days of age is counted as a qualified patient day. Newborn qualified days are equivalent to acute days and may be denoted as such.

CODE 8.0 Other admitted patient care

Other admitted patient care is care where the principal clinical intent does meet the criteria for any of the above.

Other care can be one of the following:

CODE 9.0 Organ procurement - posthumous (Other care)

Organ procurement - posthumous is the procurement of human tissue for the purpose of transplantation from a donor who has been declared brain dead.

Diagnoses and procedures undertaken during this activity, including mechanical ventilation and tissue procurement, should be recorded in accordance with the relevant ICD-10-AM Australian Coding Standards. These patients are not admitted to the hospital but are registered by the hospital.

CODE 10.0 Hospital boarder (Other care)

Hospital boarder is a person who is receiving food and/or accommodation but for whom the hospital does not accept responsibility for treatment and/or care.

Hospital boarders are not admitted to the hospital. However, a hospital may register a boarder. Babies in hospital at age 9 days of less cannot be boarders. They are admitted patients with each day of stay deemed to be either qualified or unqualified.

Comments: Unqualified newborn days (and separations consisting entirely of unqualified newborn days) are not to be counted under the Australian Health Care Agreements, and they are ineligible for health insurance benefit purposes.

4	No cataract present or has not been previously removed from either eye												
9	Not stated/inadequately described												
<i>Supplementary values:</i>													

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	Examination of the lens of the eye through a dilated pupil (visible through the pupil by the use of an ophthalmoscope) by an ophthalmologist or optometrist, as a part of the ophthalmological assessment. Ask the individual if he/she has a cataract in either or both eyes or has had a cataract removed from either or both eyes previously. Alternatively obtain information from an ophthalmologist or optometrist or from appropriate documentation.
<i>Comments:</i>	Cataract is a clouding of the lens of the eye or its capsule sufficient to reduce vision. The formation of cataract occurs more rapidly in patients with a history of ocular trauma, uveitis, or

diabetes mellitus. Cataract is an associated diabetic eye problem that could lead to blindness.

Regular eye checkups are important for patients suffering from diabetes mellitus. This helps to early detect abnormalities and to avoid or postpone vision-threatening complications. A comprehensive ophthalmological examination includes:

- check visual acuity with Snellen chart -correct with pinhole if indicated
- examine for cataract
- examine fundi with pupils dilated.

Centrelink customer reference number

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – government funding identifier, Centrelink customer reference number {N(9)A}
<i>Synonymous names:</i>	CRN; Centrelink reference number
<i>METeOR identifier:</i>	270098
<i>Registration status:</i>	Health, Standard 01/03/2005 Community services, Recorded 27/03/2007
<i>Definition:</i>	A personal identifier assigned by Centrelink for the purposes of identifying people (and organisations) eligible for specific services, including some public health care services, such as oral health services.
Data Element Concept:	Person – government funding identifier

Value domain attributes

Representational attributes

<i>Representation class:</i>	Identifier
<i>Data type:</i>	String
<i>Format:</i>	{N(9)A}
<i>Maximum character length:</i>	10

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The CRN should only be collected from persons eligible to receive health services that are to be funded by Centrelink. The number may be reported to a Centrelink agency to reconcile payment for the service provided. The data should not be used by private sector organisations for any purpose unless specifically authorised by law. For example, data linkage should not be carried out unless specifically authorised by law.
<i>Collection methods:</i>	The Centrelink Customer Reference Number (CRN) is provided on 'Health Care Cards' and 'Pensioner Concession Cards'.
<i>Comments:</i>	When a person accesses health services on the basis of being a Centrelink customer, collection of the CRN is usually necessary. This data should not be collected and recorded if it is not needed to support the provision of such health services.

Change to body structure

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – nature of impairment of body structure, code (ICF 2001) N
<i>METeOR identifier:</i>	320171
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The qualitative or quantitative change of a person's impairment in a specified body structure, as represented by a code.
Data Element Concept:	Person – nature of impairment of body structure

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001	
<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	0	No change in structure
	1	Total absence
	2	Partial absence
	3	Additional part
	4	Aberrant dimensions
	5	Discontinuity
	6	Deviating position
	7	Qualitative changes in structure
<i>Supplementary values:</i>	8	Not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	This metadata item contributes to the definition of the concept ' Disability ' and gives an indication of the experience of disability for a person. <i>Impairments of body structure</i> are problems in body structure such as a loss or significant departure from population standards or averages. CODE 0 No change in structure Used when the structure of the body part is within the range of the population standard.
-----------------------	--

CODE 1 Total absence

Used when the body structure is not present. For example total absence of the structures of the lower leg following a thorough knee amputation.

CODE 2 Partial absence

Used when only part of a body structure is present. For example partial absence of the bones of the lower leg following below knee amputation.

CODE 3 Additional part

Used when a structure, not usually present in the population is present, for example a sixth lumbar vertebra or an sixth digit on one hand.

CODE 4 Aberrant dimensions

Used when the shape and size of a body structure is significantly different from the population standard. For example radial aplasia where the shape and size of the radial bone does not develop.

CODE 5 Discontinuity

Used when parts of a body structure are separated, for example cleft palate or fracture.

CODE 6 Deviating position

Used when the location of a structure is not according to population standard; for example, transposition of the great vessels, where the aorta arises from the right ventricle and the pulmonary vessels from the left ventricle.

CODE 7 Qualitative changes in structure

Used when the structure of a body part is altered from the population standard. This includes accumulation of fluid, changes in bone structure as a result of osteoporosis or Paget's disease.

CODE 8 Not specified

Used when there is a change to a body structure, but the nature of the change is not described.

CODE 9 Not applicable

Used when it is not appropriate to code the nature of the change to a body structure.

Cholesterol—LDL (calculated)

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – low-density lipoprotein cholesterol level (calculated), total millimoles per litre N[N].N
<i>METeOR identifier:</i>	359262
<i>Registration status:</i>	Health, Standard 01/10/2008
<i>Definition:</i>	A person's calculated low-density lipoprotein cholesterol (LDL-C) in millimoles per litre.
Data Element Concept:	Person – low-density lipoprotein cholesterol level

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[N].N
<i>Maximum character length:</i>	3
<i>Supplementary values:</i>	Value Meaning 99.9 Not stated/inadequately described
<i>Unit of measure:</i>	Millimole per litre (mmol/L)

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Formula: LDL-C = (plasma total cholesterol) - (high density lipoprotein cholesterol) - (fasting plasma triglyceride divided by 2.2).
<i>Collection methods:</i>	<p>The LDL-C is usually calculated from the Friedwald Equation (Friedwald et al. 1972), which depends on knowing the blood levels of the total cholesterol and HDL-C and the fasting level of the triglyceride.</p> <p>Note that the Friedwald equation becomes unreliable when the plasma triglyceride exceeds 4.5 mmol/L.</p> <p>Note also that while cholesterol levels are reliable for the first 24 hours after the onset of acute coronary syndromes, they may be unreliable for the subsequent 8 weeks after an event.</p> <ul style="list-style-type: none">• Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities.• To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.

Comments:

High blood cholesterol is a key factor in heart, stroke and vascular disease, especially coronary heart disease (CHD).

Poor nutrition can be a contributing factor to heart, stroke and vascular disease as a population's level of saturated fat intake is the prime determinant of its level of blood cholesterol.

The majority of the cholesterol in plasma is transported as a component of LDL-C. Recent trials support a target LDL-C of <2.0 mmol/L for high risk patients with existing coronary heart disease.

<i>Guide for use:</i>	Measurement in mmol/L to 1 decimal place. Record the absolute result of the total cholesterol measurement. When reporting, record whether or not the measurement of Cholesterol-total - measured was performed in a fasting specimen.
<i>Collection methods:</i>	When reporting, record absolute result of the most recent Cholesterol-total - measured in the last 12 months to the nearest 0.1 mmol/L. Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities. <ul style="list-style-type: none">• To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.• Prolonged tourniquet use can artefactually increase levels by up to 20%.
<i>Comments:</i>	In settings where the monitoring of a person’s health is ongoing and where a measure can change over time (such as general practice), the Service contact – service contact date, DDMMYYYY should be recorded.

High blood cholesterol is a key factor in heart, stroke and vascular disease, especially coronary heart disease.

Poor nutrition can be a contributing factor to heart, stroke and vascular disease as a population's level of saturated fat intake is the prime determinant of its level of blood cholesterol.

Large clinical trials have shown that people at highest risk of cardiovascular events (e.g. pre-existing ischaemic heart disease) will derive the greatest benefit from lipid lowering drugs. Recent trials have suggested that there should be no cholesterol level threshold for the initiation of treatment in this group of patients. In October 2006, the PBS criteria for lipid-lowering drugs was expanded to include all patients identified as high-risk (based on PBS criteria) regardless of their cholesterol level.

Data element attributes

Collection and usage attributes

Comments:

Position or job classifications are specific to each profession and may differ by state or territory. The classifications above are simplified so that comparable data presentation is possible and possible confounding effects of enterprise specific structures are avoided. For example, for medicine, the job classification collected in the national health labour force collection is very broad. State/territory health authorities have more detailed classifications for salaried medical practitioners in hospitals.

These classifications separate interns, the resident medical officer levels, registrar levels, career medical officer positions, and supervisory positions including clinical and medical superintendents. Space restrictions do not at present permit these classes to be included in the National Health Labour Force Collection questionnaire.

<i>METeOR identifier:</i>	356777
<i>Registration status:</i>	Health, Standard 01/10/2008
<i>Definition:</i>	An indicator of whether there is objective evidence for a person's history of an acute coronary syndrome related medical condition, as represented by a code.
Data Element Concept:	Person – clinical evidence status (acute coronary syndrome related medical history)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code								
<i>Data type:</i>	Number								
<i>Format:</i>	N								
<i>Maximum character length:</i>	1								
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Yes</td></tr><tr><td>2</td><td>No</td></tr><tr><td>9</td><td>Not stated/inadequately described</td></tr></tbody></table>	Value	Meaning	1	Yes	2	No	9	Not stated/inadequately described
Value	Meaning								
1	Yes								
2	No								
9	Not stated/inadequately described								
<i>Supplementary values:</i>									

Collection and usage attributes

<i>Guide for use:</i>	CODE 9 Not stated/inadequately described This code is not for use in primary data collections.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	CODE 1 Yes Use this code where there is objective evidence to support a history of an acute coronary syndrome related medical condition. CODE 2 No Use this code where the history is not supported by objective evidence. Objective evidence for acute coronary syndrome related medical conditions are classified as: Chronic lung disease: Diagnosis supported by current use of chronic lung disease pharmacological therapy (e.g. inhalers, theophylline,
-----------------------	--

aminophylline, or steroids), or a forced expiratory volume in 1 second (FEV1) less than 80% predicted FEV1/forced vital capacity (FVC) less than 0.7 (post bronchodilator). Respiratory failure partial pressure of oxygen (PaO₂) less than 60 mmHg (8kPa), or partial pressure of carbon dioxide (PaCO₂) greater than 50 mmHg (6.7 kPa).

Heart failure:

Current symptoms of heart failure (typically shortness of breath or fatigue), either at rest or during exercise and/or signs of pulmonary or peripheral congestion and objective evidence of cardiac dysfunction at rest. The diagnosis is derived from and substantiated by clinical documentation from testing according to current practices.

Stroke:

Diagnosis for ischaemic: non-haemorrhagic cerebral infarction or haemorrhagic: intracerebral haemorrhage supported by cerebral imaging (CT or MRI).

Peripheral arterial disease:

- Peripheral artery disease: diagnosis is derived from and substantiated by clinical documentation for a person with a history of either chronic or acute occlusion or narrowing of the arterial lumen in the aorta or extremities.
- Aortic aneurysm: diagnosis of aneurysmal dilatation of the aorta (thoracic and or abdominal) supported and substantiated by appropriate documentation of objective testing.
- Renal artery stenosis: diagnosis of functional stenosis of one or both renal arteries is present and is supported and substantiated by appropriate documentation of objective testing.

Sleep apnoea:

Diagnosis derived from and substantiated by clinical documentation of sleep apnoea syndrome (SAS). SAS has been diagnosed from the results of a sleep study.

Other vascular conditions:

- Atrial fibrillation: diagnosis supported by electrocardiogram findings.
- Other cardiac arrhythmias and conductive disorders: diagnosis supported by electrocardiogram findings.
- Left ventricular hypertrophy: diagnosis supported by echocardiograph evidence.

Collection methods:

For each of the following medical conditions the clinical evidence status must also be recorded:

- Chronic lung disease
- Heart failure
- Stroke
- Peripheral arterial disease

- Sleep apnoea syndrome
- Other vascular conditions

Comments:

Heart failure:

Chronic heart failure is a complex clinical syndrome with typical symptoms (e.g. shortness of breath, fatigue) that can occur at rest or on effort, and is characterised by objective evidence of an underlying structural abnormality of cardiac dysfunction that impairs the ability of the ventricle to fill with or eject blood (particularly during physical activity).

The most widely available investigation for documenting left ventricular dysfunction is the transthoracic echocardiogram (TTE).

Other modalities include:

- transoesophageal echocardiography (TOE)
- gated radionuclide angiocardiology
- angiographic left ventriculography

In the absence of any adjunctive laboratory tests, evidence of supportive clinical signs of ventricular dysfunction. These include:

- cardiac auscultation (S3, cardiac murmurs),
- cardiomegaly,
- elevated jugular venous pressure (JVP),
- chest X-ray evidence of pulmonary congestion

Value	Meaning								
1	Admission within 30 days desirable for a condition that has the potential to deteriorate quickly to the point that it may become an emergency								
2	Admission within 90 days desirable for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency								
3	Admission at some time in the future acceptable for a condition causing minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and which does not have the potential to become an emergency								

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The classification employs a system of urgency categorisation based on factors such as the degree of pain, dysfunction and disability caused by the condition and its potential to deteriorate quickly into an emergency. All patients ready for care must be assigned to one of the urgency categories, regardless of how long it is estimated they will need to wait for surgery.
<i>Comments:</i>	A patient's classification may change if he or she undergoes clinical review during the waiting period. The need for clinical review varies with the patient's condition and is therefore at the discretion of the treating clinician. The waiting list information

system should be able to record dates when the classification is changed (metadata item Elective care waiting list episode – category reassignment date, DDMMYYYY).

<i>Guide for use:</i>	CODE 1 Co-located
	<p>Co-located health services are those that are established physically and organisationally as part of an acute care hospital service. There are two forms of co-location:</p> <ul style="list-style-type: none">• a health service that is built and managed as a ward or unit within an acute care hospital; or• the health service operates in a separate building but is located on, or immediately adjoining, the acute care hospital campus. <p>In the second option, units and wards within a psychiatric hospital may be classified as co-located when all the following criteria apply:</p> <ul style="list-style-type: none">• a single organisational or management structure covers the acute care hospital and the psychiatric hospital;• a single employer covers the staff of the acute care hospital and the psychiatric hospital;• the location of the acute care hospital and psychiatric hospital can be regarded as part of a single overall hospital campus; and• the patients of the psychiatric hospital are regarded as patients of the single integrated health service.

Value	Meaning								
1	Condition with onset during the episode of admitted patient care								
2	Condition not noted as arising during the episode of admitted patient care								
9	Not reported								
<i>Supplementary values:</i>									

Collection and usage attributes

<i>Guide for use:</i>	<ol style="list-style-type: none">Condition with onset during the episode of admitted patient care<ul style="list-style-type: none">a condition which arises during the episode of admitted patient care and would not have been present on admission <p>Includes:</p> <p>Conditions resulting from misadventure during medical or surgical care during the episode of admitted patient care.</p> <p>Abnormal reactions to, or later complication of, surgical or medical care arising during the episode of admitted patient care.</p> <p>Conditions arising during the episode of admitted patient care not related to surgical or medical care (for example, pneumonia).</p> <ol style="list-style-type: none">Condition not noted as arising during the episode of admitted patient care<ul style="list-style-type: none">a condition present on admission such as the presenting problem, a comorbidity, chronic disease or disease status.a previously existing condition not diagnosed until the episode of admitted patient care.
-----------------------	--

Includes:

In the case of neonates, the conditions present at birth.

A previously existing condition that is exacerbated during the episode of admitted patient care.

Conditions that are suspected at the time of admission and subsequently confirmed during the episode of admitted patient care.

Conditions that were not diagnosed at the time of admission but clearly did not develop after admission (for example malignant neoplasm).

Conditions where the onset relative to the beginning of the episode of admitted patient care is unclear or unknown.

9 Not reported

The condition onset flag could not be reported due to limitations of the data management system.

Data element attributes

Collection and usage attributes

Guide for use:

Assign the relevant condition onset flag to ICD-10-AM diagnosis codes assigned in the principal diagnosis and additional diagnosis fields for the National Hospital Morbidity Database collection.

The sequencing of diagnosis codes must comply with the Australian Coding Standards and therefore diagnosis codes should not be re-sequenced in an attempt to list diagnosis codes with the same condition onset flag together.

When it is difficult to decide if a condition was present at the beginning of the episode of care or if it arose during the episode, assign a value of 2 - Condition not noted as arising during this episode of care.

The principal diagnosis should always have a condition onset flag value of 2.

Explanatory notes:

The flag on external cause, place of occurrence and activity codes should match that of the corresponding injury or disease code.

The flag on morphology codes should match that on the corresponding neoplasm code

When a single diagnosis code describes a condition and that code contains more than one concept (e.g. diabetes with renal complications) and each concept within that code has a different condition onset flag, then assign a value of 2.

When a condition requires more than one diagnosis code to describe it, it is possible for each diagnosis code to have a different condition onset flag.

The flag on Z codes related to the outcome of delivery on the mother's record (Z37), should always be assigned a value of 2.

The flag on Z codes related to the outcome of delivery on the baby's record (Z38), should always be assigned a value of 2.

Collection methods:

A condition onset flag should be recorded and coded upon completion of an episode of admitted patient care.

Comments:

The condition onset flag is a means of differentiating those conditions which arise during, or arose before, an admitted patient episode of care. Having this information will provide an insight into the kinds of conditions patients already have when entering hospital and what arises during the episode of care. A better understanding of those conditions arising during the episode of care may inform prevention strategies particularly in relation to complications of medical care.

The flag only indicates when the condition had onset, and cannot be used to indicate whether a condition was considered to be preventable.

<i>Context:</i>	Perinatal statistics
<i>Data Element Concept:</i>	Person – congenital malformation

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	British Paediatric Association Classification of Diseases 1979
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	ANN.N[N]
<i>Maximum character length:</i>	5

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Coding to the disease classification of ICD-10-AM is the preferred method of coding admitted patients. For perinatal data collections, the use of British Paediatric Association (BPA) Classification of Diseases is preferred as this is more detailed.
<i>Comments:</i>	There is no arbitrary limit on the number of conditions specified. Most perinatal data groups and birth defects registers in the states and territories have used the 5-digit BPA Classification of Diseases to code congenital malformations since the early 1980s.

Value	Meaning						
1	Contracted admitted procedure						
2	Contracted non-admitted procedure						

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Procedures performed at another hospital under contract (Hospital B) are recorded by both hospitals, but flagged by the contracting hospital only (Hospital A). This flag is to be used by the contracting hospital to indicate a procedure performed by a contracted hospital. It also indicates whether the procedure was performed as an admitted or non-admitted service.</p> <p>Allocation of procedure codes should not be affected by the contract status of an episode: the Australian Coding Standards should be applied when coding all episodes. In particular, procedures which would not otherwise be coded should not be coded solely because they were performed at another hospital under contract.</p> <p>Procedures performed by a health care service (i.e. not a recognised hospital) should be coded if appropriate. Some jurisdictions may require these to be separately identified and they could be distinguished from contracted hospital procedures through the use of an additional code in the contract procedure flag data item.</p>

5	Contract type BA												

Collection and usage attributes

<i>Guide for use:</i>	<p>The contracting hospital (purchaser) is termed Hospital A. The contracted hospital (provider) is termed Hospital B.</p> <p>CODE 1 Contract Type B</p> <p>A health authority / other external purchaser contracts hospital B for admitted service which is funded outside the standard funding arrangements.</p> <p>CODE 2 Contract Type ABA</p> <p>Patient admitted by Hospital A. Hospital A contracts Hospital B for admitted or non-admitted patient service. Patient returns to Hospital A on completion of service by Hospital B.</p> <p>For example, a patient has a hip replacement at Hospital A, then receives aftercare at Hospital B, under contract to Hospital A. Complications arise and the patient returns to Hospital A for the remainder of care.</p> <p>CODE 3 Contract Type AB</p> <p>Patient admitted by Hospital A. Hospital A contracts Hospital B for admitted or non-admitted patient service. Patient does not return to Hospital A on completion of service by Hospital B.</p>
-----------------------	--

For example, a patient has a hip replacement at Hospital A and then receives aftercare at Hospital B, under contract to Hospital A. Patient is separated from Hospital B.

CODE 4 Contract Type (A)B

This contract type occurs where a Hospital A contracts Hospital B for the whole episode of care. The patient does not attend Hospital A. For example, a patient is admitted for endoscopy at Hospital B under contract to Hospital A.

CODE 5 Contract Type BA

Hospital A contracts Hospital B for an admitted patient service following which the patient moves to Hospital A for remainder of care. For example, a patient is admitted to Hospital B for a gastric resection procedure under contract to Hospital A and Hospital A provides after care.

2	CABG, angioplasty or stent - undertaken prior to the last 12 months												
3	CABG, angioplasty or stent - both within and prior to the last 12 months												
4	No CABG, angioplasty or stent undertaken												
9	Not stated/inadequately described												
<i>Supplementary values:</i>													

Collection and usage attributes

<i>Comments:</i>	<p>CABG is known as ‘bypass surgery’ when a piece of vein (taken from the leg) or of an artery (taken from the chest or wrist) is used to form a connection between the aorta and the coronary artery distal to the obstructive lesion, making a bypass around the blockage. Angioplasty is an elective surgery technique of blood vessels reconstruction.</p> <p>Stenting is a non-surgical treatment used with balloon angioplasty or after, to treat coronary artery disease to widen a coronary artery. A stent is a small, expandable wire mesh tube that is inserted. The purpose of the stent is to help hold the newly treated artery open, reducing the risk of the artery re-closing (re-stenosis) over time.</p> <p>Angioplasty with stenting typically leaves less than 10% of the original blockage in the artery (Heart Center Online).</p>
------------------	--

These three procedures are commonly used to improve blood flow to the heart muscle when the heart's arteries are narrowed or blocked.

The sooner procedures are done, the greater the chances of saving heart muscle.

Data element attributes

Collection and usage attributes

Collection methods: Ask the individual if he/she has had a CABG, angioplasty or coronary stent. If so determine when it was undertaken within or prior to the last 12 months (or both).

Collection and usage attributes

Guide for use: More than one code may be recorded.
Record all codes that apply.
For each coronary artery where stenosis is located the data element Person-maximum stenosis coronary artery, percentage N[NN] must also be recorded.

Collection methods: This data is derived from visual reporting by the physician reporting the angiogram.

Relational attributes

Related metadata references: See also [Person – maximum stenosis coronary artery, percentage N\[NN\]](#) Health, Standard 01/10/2008

Country of birth

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – country of birth, code (SACC 2008) NNNN
<i>METeOR identifier:</i>	370943
<i>Registration status:</i>	Health, Standard 01/10/2008 Community services, Standard 02/06/2008 Housing assistance, Standard 24/11/2008
<i>Definition:</i>	The country in which the person was born, as represented by a code.
Data Element Concept:	Person – country of birth

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	Standard Australian Classification of Countries 2008
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	NNNN
<i>Maximum character length:</i>	4

Collection and usage attributes

<i>Guide for use:</i>	<p>The Standard Australian Classification of Countries 2008 (SACC) is a four-digit, three-level hierarchical structure specifying major group, minor group and country.</p> <p>A country, even if it comprises other discrete political entities such as states, is treated as a single unit for all data domain purposes. Parts of a political entity are not included in different groups. Thus, Hawaii is included in Northern America (as part of the identified country United States of America), despite being geographically close to and having similar social and cultural characteristics as the units classified to Polynesia.</p>
-----------------------	--

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	<p>Some data collections ask respondents to specify their country of birth. In others, a pre-determined set of countries is specified as part of the question, usually accompanied by an 'other (please specify)' category.</p> <p>Recommended questions are:</p> <p>In which country were you/was the person/was (name) born?</p> <p>Australia</p> <p>Other (please specify)</p>
----------------------------	---

Alternatively, a list of countries may be used based on, for example common Census responses.

In which country were you/was the person/was (name) born?

Australia

England

New Zealand

Italy

Viet Nam

India

Scotland

Philippines

Greece

Germany

Other (please specify)

In either case coding of data should conform to the SACC.

Sometimes respondents are simply asked to specify whether they were born in either 'English speaking' or 'non-English speaking' countries but this question is of limited use and this method of collection is not recommended.

Comments:

This metadata item is consistent with that used in the [ABS collection methods](#) and is recommended for use whenever there is a requirement for comparison with ABS data (last viewed 2/6/2008).

<i>Maximum character length:</i>	4
<i>Unit of measure:</i>	Micromole per litre ($\mu\text{mol/L}$)

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>There is no agreed standard as to which units serum creatinine should be recorded in.</p> <p>Note: If the measurement is obtained in mmol/L it is to be multiplied by 1000.</p>
<i>Collection methods:</i>	<p>Measurement of creatinine should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authority.</p> <ul style="list-style-type: none">• Single venous blood test taken at the time of other screening blood tests.• Fasting not required.
<i>Comments:</i>	<p>Serum creatinine can be used to help determine renal function. Serum creatinine by itself is an insensitive measure of renal function because it does not increase until more than 50% of renal function has been lost.</p> <p>Serum creatinine together with a patient's age, weight and sex can be used to calculate glomerular filtration rate (GFR), which is an indicator of renal status/ function. The calculation uses the Cockcroft-Gault formula.</p> <p>Creatinine is normally produced in fairly constant amounts in the muscles, as a result the breakdown of phosphocreatine. It passes into the blood and is excreted in the urine. Serum creatinine can</p>

be used to help determine renal function. The elevation in the creatinine level in the blood indicates disturbance in kidney function.

GFR decreases with age, but serum creatinine remains relatively stable. When serum creatinine is measured, renal function in the elderly tends to be overestimated, and GFR should be used to assess renal function, according to the Cockcroft-Gault formula:

$$\text{GFR (ml/min)} = \frac{(140 - \text{age [yrs]}) \times \text{body wt (kg)}}{814 \times \text{serum creatinine (mmol/l)}} \quad [\times 0.85 \text{ (for women)}]$$

An alternative formula is derived from the Modification of Diet in Renal Disease (MDRD) study and does not rely on knowledge of body weight:

$$\text{GFR (ml/min/1.73m}^2\text{)} = 32788 \times \text{creatinine}^{-1.154} \text{ (umol/L)} \times \text{age}^{-0.203} \times (\text{males: 1, females: 0.742}).$$

To determine the degree of chronic renal impairment

GFR > 90ml/min - normal

GFR >60 - 90ml/min - mild renal impairment

GFR >30 - 60ml/min - moderate renal impairment

GFR 0 - 30 ml/min - severe renal impairment

Note: The above GFR measurement should be for a period greater than 3 months. GFR may also be assessed by 24-hour creatinine clearance adjusted for body surface area.

In general, patients with GFR < 30 ml/min are at high risk of progressive deterioration in renal function and should be referred to a nephrology service for specialist management of renal failure.

Patients should be assessed for the complications of chronic renal impairment including anaemia, hyperparathyroidism and be referred for specialist management if required.

Patients with rapidly declining renal function or clinical features to suggest that residual renal function may decline rapidly (ie. hypertensive, proteinuric (>1g/24hours), significant comorbid illness) should be considered for referral to a nephrologist well before function declines to less than 30ml/min. (Draft CARI Guidelines 2002. Australian Kidney Foundation). Patients in whom the cause of renal impairment is uncertain should be referred to a nephrologist for assessment.

Collection and usage attributes

Guide for use:

Any combination of the values A, E, U representing the corresponding level of accuracy of each date component of the reported date.

This data element consists of a combination of three codes, each of which denotes the accuracy of one date component:

A - the referred date component is accurate

E - the referred date component is not known but is estimated

U - the referred date component is not known and not estimated.

This data element contains positional fields (DMY) that reflects the order of the date components in the format (DDMMYYYY) of the reported date:

Field 1 (D) - refers to the accuracy of the day component;

Field 2 (M) - refers to the accuracy of the month component;

Field 3 (Y) - refers to the accuracy of the year component.

Data domain	Date component (for a format DDMMYYYY)		
	(D)ay	(M)onth	(Y)ear
Accurate	A	A	A
Estimated	E	E	E
Unknown	U	U	U

This data element is valid only for use with dates that are reported/exchanged in the format (DDMMYYYY).

Example 1: A date has been sourced from a reliable source and is known as accurate then the Date accuracy indicator should be informed as (AAA).

Example 2: If only the age of the person is known and there is no certainty of the accuracy of this, then the Date accuracy indicator should be informed as (UUE). That is the day and month are “unknown” and the year is “estimated”.

Example 3: If a person was brought in unconscious to an emergency department of a hospital and the only information available was from a relative who was certain of the age and the birthday’s ‘month’ then the Date accuracy indicator should be informed as (UAA). A year derived from an accurate month and accurate age is always an accurate year.

The Date accuracy indicator can be useful for operational purposes to indicate the level of accuracy that a date has been collected at any point in time. It can indicate whether the stored date needs to be followed up until it reaches the intended minimal required accuracy. For example, if a person was brought in unconscious to an emergency department of a hospital the level of accuracy of the date collected at that point may not be satisfactory. It is likely that the correct date of birth can be obtained at a later date. The Date accuracy indicator provides information on the accuracy of the entered dates that may require further action.

For future users of the data it may also be essential they know the accuracy of the date components of a reported date.

Data element attributes

Collection and usage attributes

Collection methods:

Collection constraints:

If constraints for the collection of the date are imposed, such as ‘a valid date must be input in an information system for unknown date components’, the Date accuracy indicator should be used along with the date as a way of avoiding the contamination of the valid dates with the same value on the respective date components.

Example:

Some jurisdictions use 0107YYYY and some use 0101YYYY when only the year is known. When month and year are known some use the 15th day as the date i.e. 15MMYYYY. Where this occurs in a data collection that is used for reporting or analysis purposes there will be dates in the collection with the attributes 0107YYYY etc that are accurate and some that are not accurate. Without a corresponding flag to determine this accuracy the analysis or report will be contaminated by those estimated dates.

Comments:

Provision of a date is often a mandatory requirement in data collections.

Most computer systems require a valid date to be recorded in a date field i.e. the month part must be an integer between 1 and 12, the day part must be an integer between 1 and 31 with rules about the months with less than 31 days, and the year part should include the century. Also in many systems, significant dates (e.g. date of birth) are mandatory requirements.

However, in actual practice, the date or date components are often not known (e.g. date of birth, date of injury) but, as stated above, computer systems require a valid date. This means that a date MUST be included and it MUST follow the rules for a valid date. It therefore follows that, while such a date will contain valid values according to the rules for a date, the date is in fact an 'unknown' or 'estimated' date. For future users of the data it is essential they know that a date is accurate, unknown or estimated and which components of the date are accurate, unknown or estimated.

	<i>Conditional obligation:</i> If a clinical event has occurred, record the date when it was experienced by the person.

Date of birth

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – date of birth, DDMMYYYY
<i>METeOR identifier:</i>	287007
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 25/08/2005 Housing assistance, Standard 20/06/2005
<i>Definition:</i>	The date of birth of the person.
Data Element Concept:	Person – date of birth

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>If date of birth is not known or cannot be obtained, provision should be made to collect or estimate age. Collected or estimated age would usually be in years for adults, and to the nearest three months (or less) for children aged less than two years. Additionally, an estimated date flag or a date accuracy indicator should be reported in conjunction with all estimated dates of birth.</p> <p>For data collections concerned with children's services, it is suggested that the estimated date of birth of children aged under 2 years should be reported to the nearest 3 month period, i.e. 0101, 0104, 0107, 0110 of the estimated year of birth. For example, a child who is thought to be aged 18 months in October of one year would have his/her estimated date of birth reported as 0104 of the previous year. Again, an estimated date flag or date accuracy indicator should be reported in conjunction with all estimated dates of birth.</p>
<i>Collection methods:</i>	<p>Information on date of birth can be collected using the one question:</p> <p>What is your/(the person's) date of birth?</p> <p>In self-reported data collections, it is recommended that the following response format is used:</p> <p>Date of birth: __ / __ / ____</p> <p>This enables easy conversion to the preferred representational layout (DDMMYYYY).</p>

For record identification and/or the derivation of other metadata items that require accurate date of birth information, estimated dates of birth should be identified by a date accuracy indicator to prevent inappropriate use of date of birth data. The linking of client records from diverse sources, the sharing of patient data, and data analysis for research and planning all rely heavily on the accuracy and integrity of the collected data. In order to maintain data integrity and the greatest possible accuracy an indication of the accuracy of the date collected is critical. The collection of an indicator of the accuracy of the date may be essential in confirming or refuting the positive identification of a person. For this reason it is strongly recommended that the data element Date – accuracy indicator, code AAA also be recorded at the time of record creation to flag the accuracy of the data.

Comments:

Privacy issues need to be taken into account in asking persons their date of birth.

Wherever possible and wherever appropriate, date of birth should be used rather than age because the actual date of birth allows a more precise calculation of age.

When date of birth is an estimated or default value, national health and community services collections typically use 0101 or 0107 or 3006 as the estimate or default for DDMM.

It is suggested that different rules for reporting data may apply when estimating the date of birth of children aged under 2 years because of the rapid growth and development of children within this age group which means that a child's development can vary considerably over the course of a year. Thus, more specific reporting of estimated age is suggested.

Date of cessation of treatment episode for alcohol and other drugs

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of treatment for alcohol and other drugs – treatment cessation date, DDMMYYYY
<i>METeOR identifier:</i>	270067
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The date on which a treatment episode for alcohol and other drugs ceases.
Data Element Concept:	Episode of treatment for alcohol and other drugs – treatment cessation date

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Refers to the date of the last service contact in a treatment episode between the client and staff of the treatment provider. In situations where the client has had no contact with the treatment provider for three months, nor is there a plan in place for further contact, the date of last service contact should be used. Refer to the glossary item Cessation of treatment episode for alcohol and other drugs to determine when a treatment episode ceases. The date must be later than or the same as the treatment commencement date for the episode of treatment for alcohol and other drugs.
<i>Comments:</i>	Required to identify the cessation of a treatment episode by an alcohol and other drug treatment service.

Date of death

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – date of death, DDMMYYYY
<i>METeOR identifier:</i>	287305
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 30/09/2005
<i>Definition:</i>	The date of death of the person.
Data Element Concept:	Person – date of death

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Recorded for persons who have died. Where Date of birth is collected, Date of death must be equal to or greater than Date of birth for the same person.
<i>Collection methods:</i>	It is recommended that in cases where all components of the date of death are not known or where an estimate is arrived at from age, a valid date be used together with a flag to indicate that it is an estimate. For record identification and/or the derivation of other metadata items that require accurate date of death information, estimated dates of death should be identified by a date accuracy indicator to prevent inappropriate use of date of death data. The linking of client records from diverse sources, the sharing of patient data, and data analysis for research and planning all rely heavily on the accuracy and integrity of the collected data. In order to maintain data integrity and the greatest possible accuracy an indication of the accuracy of the date collected is critical. The collection of Date accuracy indicator may be essential in confirming or refuting the positive identification of a person. For this reason it is strongly recommended that the data element Date accuracy indicator also be recorded at the time of record creation to flag the accuracy of the data.

Date of diagnosis of cancer

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Patient – diagnosis date (cancer), DDMMYYYY
<i>METeOR identifier:</i>	270061
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The date when the cancer was first diagnosed (whether at its primary site or as a metastasis).
<i>Context:</i>	Patient administration system, cancer notification system, population cancer statistics, research.
Data Element Concept:	Patient – diagnosis date

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Date of diagnosis must be: >= date of birth <= date of death Diagnosis of cancer after death: If the patient is first diagnosed with the cancer in an autopsy report the date of diagnosis is the date of death as stated on the patient's death certificate. Incidental diagnosis of cancer: If a patient is admitted for another condition (for example a broken leg or pregnancy), and a cancer is diagnosed incidentally then the date of diagnosis is the date the cancer was diagnostically determined, not the admission date.
<i>Collection methods:</i>	Reporting rules: The date of diagnosis is the date of the pathology report, if any, that first confirmed the diagnosis of cancer. This date may be found attached to a letter of referral or a patient's medical record from another institution or hospital. If this date is unavailable, or if no pathological test was done, then the date may be determined from one of the sources listed in the following sequence:

Date of the consultation at, or admission to, the hospital, clinic or institution when the cancer was first diagnosed. Note: DO NOT use the admission date of the current admission if the patient had a prior diagnosis of this cancer.

Date of first diagnosis as stated by a recognised medical practitioner or dentist. Note: This date may be found attached to a letter of referral or a patient's medical record from an institution or hospital.

Date the patient states they were first diagnosed with cancer. Note: This may be the only date available in a few cases (for example, patient was first diagnosed in a foreign country).

If components of the date are not known, an estimate should be provided where possible with an estimated date flag to indicate that it is estimated. If an estimated date is not possible, a standard date of 15 June 1900 should be used with a flag to indicate the date is not known.

Date of first contact

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Community nursing service episode – first contact date, DDMMYYYY
<i>METeOR identifier:</i>	270190
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The date of first contact with the community nursing service for an episode of care, between a staff member and a person or a person's family.
Data Element Concept:	Community nursing service episode – first contact date

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>This should occur after a previous last contact date of a previous care episode and prior to or on the same as first service delivery date.</p> <p>Includes:</p> <ul style="list-style-type: none">visits made to a person in institutional settings such as liaison visits or discharge planning visits, made in a hospital or residential aged care service with the intent of planning for the future delivery of service at home;telephone contacts when these are in lieu of a first home or hospital visit for the purpose of preliminary assessment for care at home;visits made to the person's home prior to admission for the purpose of assessing the suitability of the home environment for the person's care. <p>This applies irrespective of whether the person is present or not.</p> <p>Excludes:</p> <ul style="list-style-type: none">first visits where the visit objective is not met, such as first visit made where no one is home.
<i>Collection methods:</i>	<p>The first contact date can be the same as first service delivery date and apply whether a person is entering care for the first time or any subsequent episode. This date should be recorded when it is the same as the first delivery of service date.</p>

Comments:

This metadata item is recommended for use in community services which are funded for liaison or discharge planning positions or provide specialist consultancy or assessment services. Further developments in community care, including casemix and coordinated care will require collection of data relating to resource expenditure across the sector.

To enable analysis of time periods throughout a care episode, especially the pre-admission period and associated activities. This metadata item enables the capture of the commencement of care irrespective of the setting in which the activities took place.

Date of first delivery of service

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of care (community setting) – first service delivery date, DDMMYYYY
<i>METeOR identifier:</i>	270210
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The date of first delivery of service to a person in a non-institutional setting.
Data Element Concept:	Episode of care – first service delivery date (community setting)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	This date may occur on the same day or prior to the Date of last delivery of service, but must never occur after that date within the current episode of care. The date may be the same as the Community nursing service episode – first contact date, DDMMYYYY.
<i>Collection methods:</i>	As long as contact is made with the person in a non-institutional setting, the Episode of care (community setting) – first service delivery date, DDMMYYYY must be recorded. Normally this will be the first home or clinic visit and is the date most often referred to in a service agency as the admission. This date applies whether a person is being admitted for the first time, or is being re-admitted for care.
<i>Comments:</i>	<p>This metadata item is used for the analysis of time periods within a care episode and to locate that episode in time. The date relates to the first delivery of formal services within the community setting.</p> <p>This date marks the most standard event, which occurs at the beginning of an episode of care in community setting. It should not be confused with the Date of first contact with a community nursing service; although they could be the same, the dates for both items must be recorded. Agencies providing hospital-in-the-home services should develop their own method of distinguishing between the period the person remains a formal patient of the hospital, with funding to receive services at home,</p>

and the discharge of the person into the care of the community service.

<i>Supplementary values:</i>															

Collection and usage attributes

<i>Guide for use:</i>	<p>The valid values for the variable are listed below.</p> <p>CODE 1 Localised to the tissue of origin</p> <p>Includes a primary cancer where the spread is contained within the organ of origin. Note: this includes in situ breast (D05.0-D05.9) and in situ melanoma (D03.0-D03.9)</p> <p>Example 1: For colon cancer, the cancer has not progressed into the adventitia (peritoneal layer) surrounding the colon.</p> <p>Example 2: For breast cancer, the cancer has not progressed into the underlying muscle layer (pectoral) or externally to the skin.</p> <p>Example 3: For melanoma of the skin, the cancer has not invaded the subcutaneous fat layer (that is, it is contained within the dermis and epidermis).</p> <p>Example 4: For lung cancer, the cancer has not invaded the pleura.</p> <p>CODE 2 Invasion of adjacent tissue or organs</p> <p>A primary cancer has spread to adjacent organs or tissue not forming part of the organ of origin. This category includes</p>
-----------------------	---

sub-cutaneous fat or muscle and organs adjacent to the primary cancer site.

Example 1: For colon cancer, the cancer has progressed into the adventitia (peritoneal layer) surrounding the colon.

Example 2: For breast cancer, the degree of spread has progressed into the underlying muscle layer (pectoral) or externally into the skin.

Example 3: For melanoma of the skin, the cancer has invaded into subcutaneous fat or muscle.

Example 4: For lung cancer, the cancer has invaded the pleura or tissues of the mediastinum.

CODE 3 Regional lymph nodes

The primary cancer has metastasised to the nearby draining lymph nodes. The list below shows the regional lymph nodes by site of primary cancer (International Union Against Cancer's definition).

Head and neck - Cervical nodes

Larynx - Cervical nodes

Thyroid - Cervical and upper mediastinal nodes

Stomach - Perigastric nodes along the lesser and greater curvatures

Colon and Rectum - Pericolic, perirectal, and those located along the ileocolic, right colic, middle colic, left colic, inferior mesenteric and superior rectal

Anal - Perirectal, internal iliac, and inguinal lymph nodes

Liver - Hilar nodes, e.g. the hepatoduodenal ligament

Pancreas - Peripancreatic nodes

Lung - Intrathoracic, scalene and supraclavicular

Breast - Axillary, interpectoral, internal mammary

Cervix - Paracervical, parametrial, hypogastric, common, internal and external iliac, presacral and sacral

Ovary - Hypogastric (obturator), common iliac, external iliac, lateral, sacral, para-aortic and inguinal

Prostate and bladder - Pelvic nodes below the bifurcation of the common iliac arteries

Testes - Abdominal, para-aortic and paracaval nodes, the intrapelvic and inguinal nodes

Kidney - Hilar, abdominal, para-aortic or paracaval.

CODE 4 Distant metastases

The primary cancer has spread to sites distant to the primary site, for example liver and lung and bone, or any lymph nodes not stated as regional to the site (see '3 - Regional lymph nodes' above).

CODE 5 Not applicable

This category applies for lymphatic and haematopoietic cancers, e.g. myelomas, leukaemias and lymphomas (C81.0 - C96.9) only.

CODE 9 Unknown

No information is available on the degree of spread at this episode or the available information is insufficient to allow classification into one of the preceding categories.

Department of Veterans' Affairs file number

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – government funding identifier, Department of Veterans' Affairs file number AAXXNNNNA
<i>METeOR identifier:</i>	339127
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 31/08/2007
<i>Definition:</i>	A unique personal identifier issued to a veteran by the Department of Veterans' Affairs.
Data Element Concept:	Person – government funding identifier

Value domain attributes

Representational attributes

<i>Representation class:</i>	Identifier
<i>Data type:</i>	String
<i>Format:</i>	AAXXNNNN[A]
<i>Maximum character length:</i>	9

Collection and usage attributes

<i>Guide for use:</i>	<p>1st character is the state code (an alphabetic character) - N, V, Q, W, S or T for the appropriate state/territory. Australian Capital Territory is included in New South Wales (N) and Northern Territory with South Australia (S).</p> <p>Next 7 characters are the file number, made up of: War code + numeric digits, where: if War code is 1 alphabetic character, add 6 numeric characters (ANNNNNN) Where there is no war code as is the case with World War 1 veterans, insert a blank and add 6 numeric characters (NNNNNN) if War code is 2 alphabetic characters, add 5 numeric characters (AANNNNN) if War code is 3 alphabetic characters, add 4 numeric characters (AAANNNN)</p> <p>The 9th character is the segment link. For dependents of veterans, the 9th character is always an alphabetic character. The alphabetic code is generated in the order by which the cards are issued. For example A, B, C, D etc.</p> <p>CAUTIONARY NOTE: For veterans the 9th character is left blank</p>
-----------------------	--

Data element attributes

Collection and usage attributes

Collection methods:

The Department of Veterans' Affairs file number should only be collected from persons eligible to receive health services that are to be funded by the DVA. The number may be reported to the appropriate government agency to reconcile payment for the service provided.

DVA card number:

This number is the digitised version of the file number. If paper claims are optically scanned by the Health Insurance Commission, the digitised version of the file number is picked up by the scanner and converted to the normal file number format. For manual claims, the gold and white cards may be used in conjunction with the data element and an imprinter. This method records the DVA file number and other card details on a manual voucher.

The data should not be used by private sector organisations for any purpose unless specifically authorised by law. For example, private sector organisations should not use the DVA file number for data linking unless specifically authorised by relevant privacy legislation.

This number must be recorded by a service provider each time a service is provided to a person who holds the entitlement for reimbursement purposes.

Comments:

All veterans and veteran community clients are issued with a DVA file number. The veteran community may access many different benefits, ranging from pensions to health services, through their DVA file number.

Note that Veterans may have a Medicare card number and a Department of Veterans Affairs (DVA) number or only a DVA number.

DVA has three (3) types of health cards:

- Gold Card
- White Card
- Repatriation Pharmaceutical Benefits Card.

Each card indicates, to the health provider, the level of health services the holder is eligible for, at the DVA expense.

The Gold card enables the holder to access a comprehensive range of health care and related services, for all conditions, whether they are related to war service or not.

The White card enables the holder to access health care and associated services for war or service-related conditions. Veterans of Australian forces may also be issued this card to receive treatment for malignant cancer, pulmonary tuberculosis and post traumatic stress disorder and, for Vietnam veterans only, anxiety or depression, irrespective of whether these conditions are related to war service or not.

The white card holders are eligible to receive, for specific conditions, treatment from registered medical, hospital, pharmaceutical, dental and allied health care providers with whom DVA has arrangements.

A white card is also issued to eligible ex-service personnel who are from other countries, which enter into arrangements with the Australian government for the treatment of the conditions that these countries accept as war related.

When a gold/white card holder accesses health services at DVA expense, the DVA File Number is critical and should be used. The person's Medicare card number is not required or relevant.

It should be noted that there are a number of gold card holders who do not have a Medicare card.

The Repatriation Pharmaceutical Benefits card is an orange coloured card issued to eligible veterans and merchant mariners from Britain and the Commonwealth and other allied countries. This card enables the holder to access the range of pharmaceutical items available under the Repatriation Pharmaceutical Benefits Scheme. It does not provide access to other health services.

Dependency in activities of daily living—bathing

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – dependency in activities of daily living (bathing), code N
<i>METeOR identifier:</i>	270413
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	An indicator of a person’s need for assistance with bathing, as represented by a code.
<i>Context:</i>	Dependency reflects the person’s need, rather than the actual service provision which addresses that need. This is essential information in the community environment, where the relationship between a person’s functional status and care allocated is not direct. The involvement of ‘informal’ carers, the possibility of resource allocation being driven by availability rather than need, and the vulnerability of system to inequity, all require a ‘standard’ view of the person. It is against this background that resource allocation and carer burden can then be monitored. It is important to distinguish between this view of dependency and that of the institutional system, where a dependency ‘measure’ may be used to predict or dictate staffing needs or to allocate funding.
Data Element Concept:	Person – dependency in activities of daily living

Collection and usage attributes

<i>Guide for use:</i>	Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.
-----------------------	--

Each agency should seek to adopt a dependency classification, which can be mapped to other classifications and produce equivalent scores.

Collection methods:

Commencement of care episode (there may be several visits in which assessment data are gathered).

Comments:

There are a significant number of dependency instruments in use in the community and institutional care. The Community Nursing Minimum Data Set Australia recommends the adoption of a dependency tool from a limited range of options as outlined in Guide for use.

The Person dependency in activities of daily living metadata items consist of a number of standard elements, which can be used to map to and/or score from the majority of dependency instruments.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Record the minutes of day-time technical care required per week. Technical care refers to technical tasks and procedures for which nurses receive specific education and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. In the community nursing setting, carers may undertake some of these
-----------------------	--

activities within, and under surveillance, of a nursing care-plan. Some examples of technical care activities are:

- medication administration (including injections)
- dressings and other procedures
- venipuncture
- monitoring of dialysis
- implementation of pain management technology.

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Data element attributes

Collection and usage attributes

Guide for use:

Extra surveillance refers to behaviour, which requires individual attention and/or planned intervention. Some examples are:

- aggressiveness
- wandering
- impaired memory or attention
- disinhibition and other cognitive impairment.

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Each agency should seek to adopt a dependency classification, which can be mapped to other classifications and produce equivalent scores.

Collection methods:

Commencement of care episode (there may be several visits in which assessment data are gathered).

Comments:

There are a significant number of dependency instruments in use in the community and institutional care. The Community Nursing Minimum Data Set Australia recommends the adoption of a dependency tool from a limited range of options as outlined in Guide for use.

The Person dependency in activities of daily living metadata items consist of a number of standard elements, which can be used to map to and/or score from the majority of dependency instruments.

Dependency in activities of daily living—infrequent technical nursing care requirement

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – technical nursing care requirement (infrequent), total minutes NNN
<i>METeOR identifier:</i>	270423
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	A person’s need for infrequent technical nursing care per month measured in minutes.
<i>Context:</i>	Dependency reflects the person’s need, rather than the actual service provision which addresses that need. This is essential information in the community environment, where the relationship between a person’s functional status and care allocated is not direct. The involvement of ‘informal’ carers, the possibility of resource allocation being driven by availability rather than need, and the vulnerability of system to inequity, all require a ‘standard’ view of the person. It is against this background that resource allocation and carer burden can then be monitored. It is important to distinguish between this view of dependency and that of the institutional system, where a dependency ‘measure’ may be used to predict or dictate staffing needs or to allocate funding.
Data Element Concept:	Person – technical nursing care requirement

<i>Supplementary values:</i>	Value Meaning
	1 No technical care requirements
<i>Unit of measure:</i>	Minute (m)

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Record the minutes of infrequent technical care required per month. Technical care refers to technical tasks and procedures for which nurses receive specific education and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. In the
-----------------------	---

community nursing setting, carers may undertake some of these activities within, and under surveillance, of a nursing care-plan. Some examples of technical care activities are:

- medication administration (including injections)
- dressings and other procedures
- venipuncture
- monitoring of dialysis
- implementation of pain management technology.

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Collection and usage attributes

<i>Guide for use:</i>	<p>Note that where there is a Gestational diabetes mellitus (GDM) or Previous GDM (i.e. permissible values 3 & 5) and a current history of Type 2 diabetes then record 'Code 2' Type 2 diabetes.</p> <p>This same principle applies where a history of either Impaired fasting glycaemia (IFG) or Impaired glucose tolerance (IGT) and a current history and Type 2 diabetes, then record 'Code 2' Type 2 diabetes.</p> <p>CODE 01 Type 1 diabetes</p> <p>Beta-cell destruction, usually leading to absolute insulin deficiency. Includes those cases attributed to an autoimmune process, as well as those with beta-cell destruction and who are prone to ketoacidosis for which neither an aetiology nor pathogenesis is known (idiopathic). It does not include those</p>
-----------------------	---

forms of beta-cell destruction or failure to which specific causes can be assigned (e.g. cystic fibrosis, mitochondrial defects). Some subjects with Type 1 diabetes can be identified at earlier clinical stages than 'diabetes mellitus'.

CODE 02 Type 2 diabetes

Type 2 includes the common major form of diabetes, which results from defect(s) in insulin secretion, almost always with a major contribution from insulin resistance.

CODE 03 Gestational diabetes mellitus (GDM)

GDM is a carbohydrate intolerance resulting in hyperglycaemia of variable severity with onset or first recognition during pregnancy. The definition applies irrespective of whether or not insulin is used for treatment or the condition persists after pregnancy. Diagnosis is to be based on the Australian Diabetes in Pregnancy Society (ADIPS) Guidelines.

CODE 04 Other (secondary diabetes)

This categorisation include less common causes of diabetes mellitus, but are those in which the underlying defect or disease process can be identified in a relatively specific manner. They include, for example, genetic defects of beta-cell function, genetic defects in insulin action, diseases of the exocrine pancreas, endocrinopathies, drug or chemical-induced, infections, uncommon forms of immune-mediated diabetes, other genetic syndromes sometimes associated with diabetes.

CODE 05 Previous GDM

Where the person has a history of GDM.

CODE 06 Impaired fasting glycaemia (IFG)

IFG or 'non-diabetic fasting hyperglycaemia' refers to fasting glucose concentrations, which are lower than those required to diagnose diabetes mellitus but higher than the normal reference range. An individual is considered to have IFG if they have a fasting plasma glucose of 6.1 or greater and less than 7.0 mmol/L if challenged with an oral glucose load, they have a fasting plasma glucose concentration of 6.1 mmol/L or greater, but less than 7.0 mmol/L, AND the 2 hour value in the Oral Glucose Tolerance Test (OGTT) is less than 7.8 mmol/L.

CODE 07 Impaired glucose tolerance (IGT)

IGT is categorised as a stage in the natural history of disordered carbohydrate metabolism; subjects with IGT have an increased risk of progressing to diabetes. IGT refers to a metabolic state intermediate between normal glucose homeostasis and diabetes. Those individuals with IGT manifest glucose intolerance only when challenged with an oral glucose load. IGT is diagnosed if the 2 hour value in the OGTT is greater than 7.8 mmol/L. and less than 11.1 mmol/L AND the fasting plasma glucose concentration is less than 7.0 mmol/L.

CODE 08 Not diagnosed with diabetes

The subject has no known diagnosis of Type 1, Type 2, GDM, Previous GDM, IFG, IGT or Other (secondary diabetes).

CODE 09 Not assessed

The subject has not had their diabetes status assessed.

CODE 99 Not stated/inadequately described

This code is for unknown or information unavailable.

Collection methods:

The diagnosis is derived from and must be substantiated by clinical documentation.

Source and reference attributes

Use this code when missing information.

Data element attributes

Collection and usage attributes

Collection methods: To be collected at the commencement of treatment and at each review.

Comments: In settings where the monitoring of a person's health is ongoing and where management can change over time (such as general practice), the Service contact – service contact date, DDMMYYYY should be recorded.

The main use of this data element is to enable categorisation of management regimes against best practice for diabetes.

Difficulty with activities

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – level of difficulty with activities in life areas, code (ICF 2001) N
<i>METeOR identifier:</i>	320120
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The level of difficulty a person has in performing the tasks and actions involved in specified life areas, as represented by a code.
<i>Context:</i>	Human functioning and disability
<i>Data Element Concept:</i>	Person – level of difficulty with activities in a life area

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001	
<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	0	No difficulty
	1	Mild difficulty
	2	Moderate difficulty
	3	Severe difficulty
	4	Complete difficulty
<i>Supplementary values:</i>	8	Not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p>In the context of health, an activity is the execution of a task or action by an individual. Activity limitations are difficulties an individual may have in executing an activity.</p> <p>Difficulties with activities can arise when there is a qualitative or quantitative alteration in the way in which these activities are carried out. Difficulty includes matters such as 'with pain', 'time taken', 'number of errors', 'clumsiness', 'modification of manner in which an activity is performed' e.g. sitting to get dressed instead of standing. 'Difficulty' is a combination of the frequency</p>
-----------------------	--

with which the problem exists, the duration of the problem and the intensity of the problem. Activity limitations are assessed against a generally accepted population standard, relative to cultural and social expectations.

Activity limitation varies with the environment and is assessed in relation to a particular environment; the absence or presence of **assistance**, including aids and equipment, is an aspect of the environment.

The user will select the code that most closely summarises, in terms of duration, frequency, manner or outcome, the level of difficulty of the person for whom the data is recorded.

CODE 0 No difficulty in this life area

Is used when there is no difficulty in performing this activity. This scale has a margin of error of 5%. [0-4%]

CODE 1 Mild difficulty

Is recorded for example, when the level of difficulty is below the threshold for medical intervention, the difficulty is experienced less than 25% of the time, and/or with a low alteration in functioning which may happen occasionally over the last 30 days. [5-24%]

CODE 2 Moderate difficulty

Is used for example when the level of difficulty is experienced less than 50% of the time and/or with a significant, but moderate effect on functioning (Up to half the scale of total performance) which may happen regularly over the last 30 days. [25-49%]

CODE 3 Severe difficulty

Is used for example when performance in this life area can be achieved, but with only extreme difficulty, and/or with an extreme effect on functioning which may happen often over the last 30 days. [50-95%]

CODE 4 Complete difficulty

Is used when the person can not perform in this life area due of the difficulty in doing so. This scale has a margin of error of 5%. [96-100%]

CODE 8 Not specified

Is used where a person has difficulty with activities in a life area but there is insufficient information to use codes 0-4.

CODE 9 Not applicable

Is used where a life area is not applicable to this person, e.g. domestic life for a child under 5.

<i>Guide for use:</i>	CODE 9 Not stated/inadequately described This code is not for use in primary data collections.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Code 1 Yes Record if Q waves are identified on the follow-up electrocardiogram. Code 2 No Record if no Q waves are identified on the follow-up electrocardiogram.
<i>Collection methods:</i>	Do not record the presence of Q waves for the initial ECG. This data element should only be collected for follow-up ECGs.

Relational attributes

<i>Related metadata references:</i>	See also Electrocardiogram—new Q waves indicator, yes/no code N Health, Standard 01/10/2008
<i>Implementation in Data Set Specifications:</i>	Electrocardiogram cluster Health, Standard 01/10/2008 <i>Conditional obligation:</i>

Record for all follow up electrocardiograms performed after the initial electrocardiogram.

Electrocardiogram—new Q waves indicator

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Electrocardiogram—new Q waves indicator, yes/no code N
<i>Synonymous names:</i>	ECG - new Q waves
<i>METeOR identifier:</i>	343902
<i>Registration status:</i>	Health, Standard 01/10/2008
<i>Definition:</i>	Whether the Q waves identified on a person's follow-up electrocardiogram (ECG) is new, as represented by a code.
Data Element Concept:	Electrocardiogram—new Q waves indicator

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code						
<i>Data type:</i>	Number						
<i>Format:</i>	N						
<i>Maximum character length:</i>	1

<i>Supplementary values:</i>																							

Collection and usage attributes

<i>Guide for use:</i>	ST-segment changes CODE 10 ST-segment-elevation \geq 1 mm (0.1 mV) in \geq 2 contiguous limb leads ST-segment-elevation indicates greater than or equal to 1 mm (0.1 mV) elevation in 2 or more contiguous limb leads. CODE 11 ST-segment-elevation \geq 2 mm (0.2 mV) in \geq 2 contiguous chest leads ST-segment-elevation indicates greater than or equal to 2 mm (0.2 mV) elevation in 2 or more contiguous chest leads.
-----------------------	--

CODE 12 ST-segment depression ≥ 0.5 mm (0.05 mV) in ≥ 2 contiguous leads (includes reciprocal changes)

ST-segment depression of at least 0.5 mm (0.05 mV) in 2 or more contiguous leads (includes reciprocal changes).

T-wave changes

CODE 20 T-wave inversion ≥ 2 mm (0.2 mV)

T-wave inversion of at least 2 mm (0.2 mV) including inverted T waves that are not indicative of acute MI.

Q wave changes

CODE 30 Significant Q waves

Q waves refer to the presence of Q waves that are greater than or equal to 0.03 seconds in width and greater than or equal to 1 mm (0.1 mV) in depth in at least 2 contiguous leads.

Bundle-branch block changes

CODE 40 Left bundle branch block (BBB)

Diffuse left bundle-branch block pattern.

CODE 41 Right bundle-branch block (BBB)

Diffuse right bundle-branch block pattern.

CODE 42 Indeterminate bundle-branch block (BBB)

Bundle-branch block pattern identified, but left or right location is unclear.

CODE 90 Non-specific

Changes not meeting the above criteria.

CODE 99 Not stated/inadequately described

Includes unknown.

Data element attributes

Collection and usage attributes

Guide for use:

More than one code may be recorded.

Record all that apply (codes 90 and 99 are excluded from multiple coding).

Collection methods:

Where codes 40, 41 or 42 are recorded Electrocardiogram - bundle-branch block status, code N must also be recorded.

Data element attributes

Collection and usage attributes

Guide for use: An Emergency Department service event can be commenced by a doctor, nurse, mental health practitioner or other health professional, when investigation, care and/or treatment is provided in accordance with an established clinical pathway defined by the Emergency Department. Placement of a patient in a cubicle and observations taken to monitor a patient pending a clinical decision regarding commencement of a clinical pathway, do not constitute commencement.

The following examples illustrate the commencement of an Emergency Department service event.

Example 1

- A patient presents at the Emergency Department with mild asthma. At triage, the patient is categorised as category three and returns to the waiting area.
- The patient has a more severe asthma attack in the waiting area, is re-triaged to category two and shown to a cubicle where standard observations are taken.
- A nurse comes to the cubicle and commences treatment based on an acknowledged clinical pathway of the

Emergency Department. At this point : **Emergency Department service event has commenced.**

Example 2

- A patient presents at the Emergency Department in an agitated, delusional state. At triage, the patient is categorised as category two and placed in a cubicle and the mental health practitioner notified.
- Observations are taken and nursing staff continue to observe the patient.
- The mental health practitioner arrives, assesses the patient and develops a management plan. At this point : **Emergency Department service event has commenced.**

Example 3

- A patient presents at the Emergency Department with an ankle injury from football. At triage, the patient is categorised as category four and moved to the 'fast track area'.
- The physiotherapist attends, examines the patient, makes an assessment (including diagnostic imaging requirements) and determines a treatment plan. At this point : **Emergency Department service event has commenced.**

Example 4

- A patient presents at the Emergency Department with a sore arm, following a fall, with limited arm movement possible.
- The patient is categorised as category three at triage and placed in a cubicle.
- A nurse provides analgesia and assesses the patient, including ordering diagnostic imaging. At this point : **Emergency Department service event has commenced.**

Example 5

- A patient presents at the Emergency Department feeling vague and having been generally unwell for a day or two. The patient has a slight cough. At triage, the patient is categorised as category three.
- The patient is placed in a cubicle where standard observations are taken. Respiration is 26 bpm, BP is 90/60 and the patient is hypoxic. The patient is given oxygen, and the treating clinician attends and provides instruction regarding patient care. At this point : **Emergency Department service event has commenced.**

Example 6

- A patient presents at the Emergency Department with chest pain. Triage category two is allocated. The patient is placed in a cubicle and a nurse gives oxygen and Anginine, takes blood samples and conducts an ECG. The ECG is reviewed. At this point : **Emergency Department service event has commenced.**
- A doctor subsequently arrives and the patient is transferred to the catheter lab after examination.

Example 7

- The Emergency Department is notified by ambulance that a patient is being transported having severe behavioural problems.
- The patient is taken to an appropriate cubicle and restrained.
- A clinician administers sedation and requests the attendance of a mental health practitioner. At this point : **Emergency Department service event has commenced.**

Collection methods:

Collected in conjunction with emergency department service commencement time.

Data element attributes

Collection and usage attributes

Guide for use: An Emergency Department service event can be commenced by a doctor, nurse, mental health practitioner or other health professional, when investigation, care and/or treatment is provided in accordance with an established clinical pathway defined by the Emergency Department. Placement of a patient in a cubicle and observations taken to monitor a patient pending a clinical decision regarding commencement of a clinical pathway, do not constitute commencement.

The following examples illustrate the commencement of an Emergency Department service event.

Example 1

- A patient presents at the Emergency Department with mild asthma. At triage, the patient is categorised as category three and returns to the waiting area.
- The patient has a more severe asthma attack in the waiting

area, is re-triaged to category two and shown to a cubicle where standard observations are taken.

- A nurse comes to the cubicle and commences treatment based on an acknowledged clinical pathway of the Emergency Department. At this point : **Emergency Department service event has commenced.**

Example 2

- A patient presents at the Emergency Department in an agitated, delusional state. At triage, the patient is categorised as category two and placed in a cubicle and the mental health practitioner notified.
- Observations are taken and nursing staff continue to observe the patient.
- The mental health practitioner arrives, assesses the patient and develops a management plan. At this point : **Emergency Department service event has commenced.**

Example 3

- A patient presents at the Emergency Department with an ankle injury from football. At triage, the patient is categorised as category four and moved to the 'fast track area'.
- The physiotherapist attends, examines the patient, makes an assessment (including diagnostic imaging requirements) and determines a treatment plan. At this point : **Emergency Department service event has commenced.**

Example 4

- A patient presents at the Emergency Department with a sore arm, following a fall, with limited arm movement possible.
- The patient is categorised as category three at triage and placed in a cubicle.
- A nurse provides analgesia and assesses the patient, including ordering diagnostic imaging. At this point : **Emergency Department service event has commenced.**

Example 5

- A patient presents at the Emergency Department feeling vague and having been generally unwell for a day or two. The patient has a slight cough. At triage, the patient is categorised as category three.
- The patient is placed in a cubicle where standard observations are taken. Respiration is 26 bpm, BP is 90/60 and the patient is hypoxic. The patient is given oxygen, and the treating clinician attends and provides instruction regarding patient care. At this point : **Emergency Department service event has commenced.**

Example 6

- A patient presents at the Emergency Department with chest pain. Triage category two is allocated. The patient is placed in a cubicle and a nurse gives oxygen and Anginine, takes blood samples and conducts an ECG. The ECG is reviewed. At this point : **Emergency Department service event has commenced.**

- A doctor subsequently arrives and the patient is transferred to the catheter lab after examination.

Example 7

- The Emergency Department is notified by ambulance that a patient is being transported having severe behavioural problems.
- The patient is taken to an appropriate cubicle and restrained.
- A clinician administers sedation and requests the attendance of a mental health practitioner. At this point : **Emergency Department service event has commenced.**

Collection methods:

Collected in conjunction with emergency department service episode service commencement date.

-----------------------	------

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Calculated from admission date and time minus date and time patient presents for those emergency department patients who are admitted.
<i>Collection methods:</i>	To be collected on patients presenting to emergency department for unplanned care in public hospitals with emergency department and private hospitals providing contracted services for the public sector.
<i>Comments:</i>	This is a critical waiting times metadata item. It is used to examine the length of waiting time, for performance indicators and benchmarking. Information based on this metadata item will have many uses including to assist in the planning and management of hospitals and in health care research.

<i>Guide for use:</i>	<p>Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.</p> <p>Employee related expenses are to be reported in millions to the nearest 100,000 e.g. \$4,064,000 should be reported as \$4.1 million.</p> <p>When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).</p> <p>Includes:</p> <ul style="list-style-type: none">• Salaries, wages and supplements for all employees of the organisation (including contract staff employed by an agency, provided staffing data is also available). This is to include all paid leave (recreation, sick and long-service) and salary and wage payments relating to workers compensation leave.• Superannuation employer contributions paid or, for an emerging cost scheme, that should be paid (as determined by
-----------------------	---

an actuary) on behalf of establishment employees either by the establishment or a central administration such as a state health authority, to a superannuation fund providing retirement and related benefits to establishment employees, for a financial year.

- Workers compensation premiums and payments

Collection methods:

Employee related expenses are to be reported for the *Health industry relevant organisation type* and *Type of health and health related functions* data elements.

Health industry relevant organisation type

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments:

In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Employment status (admitted patient)

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – labour force status, acute hospital and private psychiatric hospital admission code N
<i>METeOR identifier:</i>	269948
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Self-reported employment status of a person, immediately prior to admission to an acute or private psychiatric hospital, as represented by a code.
<i>Context:</i>	The Australian Health Ministers' Advisory Council Health Targets and Implementation Committee (1988) identified socioeconomic status as the most important factor explaining health differentials in the Australian population. The committee recommended that national health statistics routinely identify the various groups of concern. This requires routine recording in all collections of indicators of socioeconomic status. In order of priority, these would be: employment status, income, occupation and education.
Data Element Concept:	Person – labour force status

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 EMPLOYED IN THE REGISTERED PROFESSION</p> <p>Health professionals employed in the registered profession may be working in Australia or they may be working overseas.</p> <p>CODE 2 EMPLOYED OUTSIDE OF THE REGISTERED PROFESSION</p> <p>Health professionals who are employed in Australia or overseas, but not in the registered profession.</p> <p>CODE 3 NOT EMPLOYED</p> <p>Health professionals in this category may be unemployed (not employed and seeking work) or not in the labour force (not employed and not seeking work). This is consistent with the ABS Labour Force standard which allows the aggregation of 'Unemployed' and 'Not in the labour force' to form the category 'Not employed'.</p> <p>FURTHER DEFINITIONS</p> <p>The term 'employed' includes employees, employers, own account workers and contributing family workers.</p>
-----------------------	---

The definitions of employed and unemployed in this data element differ slightly from Australian Bureau of Statistics (ABS) definitions. The main differences are:

- The labour force collection includes health professionals working in the Defence Forces. ABS does not, with the exception of the population census.
- ABS uses a tightly defined reference period for employment and unemployment; the labour force collection reference period is self-defined by the respondent as his/her usual status during the week before registration.
- The scope of the labour force collection is all health professionals listed by the Australian Health Practitioner Regulation Agency, regardless of their residential status in Australia. The scope of the ABS Labour Force Survey is usual residents of Australia. That is, those persons who will be living in Australia for at least 12 months.

<i>Maximum character length:</i>	5

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p>Environmental factors represent the circumstances in which the individual lives. These factors are conceived as immediate (e.g. physical features of the environment, social environment) and societal (formal and informal social structures, services and systems). Different environments may have a very different impact on the same individual with a given health condition.</p> <p>Facilitators are features of the environment that have a positive effect on disability. Barriers are features of the environment that have a negative effect on disability.</p> <p>Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both 'Attitudes' (chapter level) and 'Social, norms, practices and ideology' (3 digit level) as the former includes the latter.</p> <p>The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with <i>Extent of environmental factor influence code [X]N</i> will use the codes as indicated. The full range of the permissible values together</p>
-----------------------	--

with definitions can be found in the *Environmental Factors* component of the ICF.

CODE e1 Products and technology

CODE e2 Natural environment and human-made changes to environment

CODE e3 Support and relationships

CODE e4 Attitudes

CODE e5 Services, systems and policies

Data collected at this level will provide a general description of the environmental factors and can only be compared with data collected at the same level.

An example of a value domain at the 3 digit level from the Environmental factors component may include:

CODE e225 Climate

CODE e240 Light

CODE e250 Sound

CODE e255 Vibration

CODE e260 Air quality

An example of a value domain at the 4 digit level from the environmental factors component may include:

CODE e1151 Assistive products and technology for personal use in daily life

CODE e1201 Assistive products and technology for personal indoor and outdoor mobility and transportation

CODE e2151 Assistive products and technology for communication

CODE e1301 Assistive products and technology for education

CODE e1351 Assistive products and technology for employment

CODE e1401 Assistive products and technology for culture, recreation and sport

CODE e1451 Assistive products and technology for the practice of religion and spirituality

The prefix *e* denotes the domains within the component of *Environmental Factors*.

Data element attributes

Collection and usage attributes

Guide for use:

This data element is a neutral list of environmental factors. It may be used, in conjunction with Person—extent of environmental factor influence, code (ICF 2001) [X]N, in health, community services and other disability-related data collections to record the environmental factors that facilitate or inhibit optimum functioning at the body, person or societal level. Identification of environmental factors may assist in determining appropriate interventions to support the person to achieve optimum functioning.

Collection and usage attributes

Guide for use:

Establishments are classified into 10 major types subdivided into major groups:

- residential establishments (R)
- non-residential establishments (N)

CODE R1 Acute care hospitals

Establishments which provide at least minimal medical, surgical or obstetric services for inpatient treatment and/or care, and which provide round-the-clock comprehensive qualified nursing service as well as other necessary professional services. They must be licensed by the state health department, or controlled by government departments. Most of the patients have acute conditions or temporary ailments and the average stay per admission is relatively short.

Hospitals specialising in dental, ophthalmic aids and other specialised medical or surgical care are included in this category. Hospices (establishments providing palliative care to terminally ill patients) that are freestanding and do not provide any other form of acute care are classified to R6.

CODE R2 Psychiatric hospitals

Establishments devoted primarily to the treatment and care of inpatients with psychiatric, mental, or behavioural disorders. Private hospitals formerly approved by the Commonwealth Department of Health under the Health Insurance Act 1973 (Cwlth) (now licensed/approved by each state health authority), catering primarily for patients with psychiatric or behavioural disorders are included in this category.

Centres for the non-acute treatment of drug dependence, developmental and intellectual disability are not included here (see below). This code also excludes institutions mainly providing living quarters or day care.

CODE R3 Nursing homes

Establishments which provide long-term care involving regular basic nursing care to chronically ill, frail, disabled or convalescent

persons or senile inpatients. They must be approved by the Commonwealth Department of Health and Family Services and/or licensed by the State, or controlled by Government departments.

Private profit nursing homes are operated by private profit-making individuals or bodies.

Private charitable nursing homes are participating nursing homes operated by religious and charitable organisations.

Government nursing homes are nursing homes either operated by or on behalf of a state or territory Government.

CODE R4 Alcohol and drug treatment centres

Freestanding centres for the treatment of drug dependence on an inpatient basis.

CODE R5 Hostels and residential services

Establishments run by public authorities or registered non-profit organisation to provide board, lodging or accommodation for the aged, distressed or disabled who cannot live independently but do not need nursing care in a hospital or nursing home. Only hostels subsidised by the Commonwealth are included. Separate dwellings are not included, even if subject to an individual rental rebate arrangement. Residents are generally responsible for their own provisions, but may be provided in some establishments with domestic assistance (meals, laundry, personal care). Night shelters providing only casual accommodation are excluded.

CODE R6 Hospices

Establishments providing palliative care to terminally ill patients. Only freestanding hospices which do not provide any other form of acute care are included in this category.

CODE N7 Same-day establishments

This code includes both the traditional day centre/hospital and also freestanding day surgery centres.

Day centres/hospitals are establishments providing a course of acute treatment on a full-day or part-day non-residential attendance basis at specified intervals over a period of time. Sheltered workshops providing occupational or industrial training are excluded.

Freestanding day surgery centres are hospital facilities providing investigation and treatment for acute conditions on a day-only basis and are approved by the Commonwealth for the purposes of basic table health insurance benefits.

CODE N8 Non-residential health services

Services administered by public authorities or registered non-profit organisations which employ full-time equivalent medical or paramedical staff (nurses, nursing aides, physiotherapists, occupational therapists and psychologists, but not trade instructors or teachers). This definition distinguishes health services from welfare services (not within the scope of the National Minimum Data Project) and thereby excludes such services as sheltered workshops, special schools for the

intellectually disabled, meals on wheels and baby clinics offering advisory services but no actual treatment. Non-residential health services should be enumerated in terms of services or organisations rather than in terms of the number of sites at which care is delivered.

Non-residential health services provided by a residential establishment (for example, domiciliary nursing service which is part of a public hospital) should not be separately enumerated.

CODE N8.1 Community health centres

Public or registered non-profit establishments in which a range of non-residential health services is provided in an integrated and coordinated manner, or which provides for the coordination of health services elsewhere in the community.

CODE N8.2 Domiciliary nursing service

Public or registered non-profit or profit-making establishments providing nursing or other professional paramedical care or treatment to patients in their own homes or in (non-health) residential institutions. Establishments providing domestic or housekeeping assistance are excluded by the general definition above.

Comments: Note that national minimum data sets currently include only community health centres and domiciliary nursing services.

Data element attributes

Collection and usage attributes

Comments: In the current data element, the term establishment is used in a very broad sense to mean bases, whether institutions, organisations or the community from which health services are provided. Thus, the term covers conventional health establishments and also organisations which may provide services in the community.

This metadata item is currently under review by the Establishments Framework Working Group of the Health Data Standards Committee. Recommendations will provide a comprehensive coverage of the health service delivery sector.

Value	Meaning						
1	Extended wait patient						
2	Other patient						

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	A patient is classified as an extended wait patient if the patient is in clinical urgency category 3 at the time of admission or at a census time and has been waiting for the elective surgery for more than one year.
<i>Comments:</i>	This metadata item is used to identify clinical urgency category 3 patients who had waited longer than one year at admission or have waited longer than one year at the time of a census. An extended wait patient is not an overdue patient as there is no maximum desirable waiting time specified for patients in clinical urgency category 3 as they have been assessed as not having a clinically urgent need for the awaited procedure.

Extent of participation

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – extent of participation in a life area, code (ICF 2001) N
<i>METeOR identifier:</i>	320219
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The degree of participation by an individual in a specified life area, as represented by a code.
<i>Context:</i>	Human functioning and disability
<i>Data Element Concept:</i>	Person – extent of participation in a life area

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001	
<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	0	Full participation
	1	Mild participation restriction
	2	Moderate participation restriction
	3	Severe participation restriction
	4	Complete participation restriction
<i>Supplementary values:</i>	8	Not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p>In the context of health, participation is involvement in a life situation. Participation restrictions are problems an individual may experience in involvement of life situations.</p> <p>This metadata item may be used to describe the extent of participation in life situations for an individual with a health condition. The standard or norm to which an individual's participation is compared is that of an individual without a similar health condition in that particular society. The participation restriction records the discordance between the experienced participation and the expected participation of an</p>
-----------------------	---

individual without a health condition. The definition of 'particular society' is not specified and will inevitably give rise to different interpretations. If limiting the interpretation, it will be necessary to state the factors which are taken into account, for example, age, gender, ethnicity, religion, education, locality (town, state, rural, remote, urban).

The user will select the code that most closely summarises, in terms of duration, frequency, manner or outcome, the level of participation of the person for whom the data is recorded.

CODE 0 Full participation

Used when the person participates in this life area in the same way in terms of duration, frequency, manner or outcome as other individuals without a similar health condition in that particular society

CODE 1 Mild participation restriction

Used for example, when the person is restricted in their participation less than 25% of the time, and/or with a low alteration in functioning which may happen occasionally over the last 30 days

CODE 2 Moderate participation restriction

Used for example, when the person is restricted in their participation between 26% and 50% of the time with a significant, and/or with a moderate effect on functioning (Up to half the total scale of performance) which may happen regularly over the last 30 days

CODE 3 Severe participation restriction

Used for example, when participation in this life area can be achieved, but only rarely and/or with an extreme effect on functioning which may happen often over the last 30 days

CODE 4 Complete participation restriction

Used when the person can not participate in this life area. This scale has a margin of error of 5%

CODE 8 Not specified

Used when a person's participation in a life area is restricted but there is insufficient information to use codes 0-4

CODE 9 Not applicable

Used when participation in a life area is not relevant, such as employment for an infant.

Source and reference attributes

- Australian Collaborating Centre ICF website
<http://www.aihw.gov.au/disability/icf/index.cfm>

Data element attributes

Collection and usage attributes

Guide for use:

Extent of participation is always associated with a health condition. For example, a restriction in participation in 'community, social and civic life' may be recorded when the person has had a stroke, but not when the restriction is associated only with personal preferences, without a related health condition. A value is attached to restriction of participation (i.e. a participation restriction is a disadvantage). The value is dependent on cultural norms, so that an individual may be disadvantaged in one group or location and not in another place.

This data element is used in conjunction with a specified Activities and participation life area (ICF 2001) AN[NNN]. For example, a 'mild restriction in participation in exchange of information'.

Comments: This code list has been derived from the ICD-10-AM external cause classification.

Source and reference attributes

Reference documents: International Classification of Diseases - Tenth Revision - Australian Modification (3rd edition 2002)

Data element attributes

Collection and usage attributes

Guide for use: This metadata item is for use in injury surveillance purposes only, when it is not possible to use a complete ICD-10-AM code (e.g. Non-admitted patients in emergency departments). Select the item which best characterises the circumstances of the injury, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate select the one that comes first in the code list. The external cause - non-admitted patient group must always be accompanied by an external cause - human intent code (see metadata item Injury event – external cause, non-admitted patient human intent code NN).

Comments: This metadata item has been developed to cater for the information requirements of the wide range of settings where injury surveillance is undertaken and do not have the capability of recording the complete ICD-10-AM external cause codes.

Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

<i>Definition:</i>	That part of a name a person usually has in common with some other members of his/her family, as distinguished from his/her given names, as represented by text.
Data Element Concept:	Person (name) – family name

Value domain attributes

Representational attributes

<i>Representation class:</i>	Text
<i>Data type:</i>	String
<i>Format:</i>	X[X(39)]
<i>Maximum character length:</i>	40

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The agency or establishment should record the person's full family name on their information systems.</p> <p>National Community Services Data Dictionary specific:</p> <p>In instances where there is uncertainty about which name to record for a person living in a remote Aboriginal or Torres Strait Islander community, Centrelink follows the practice of recording the Indigenous person's name as it is first provided to Centrelink. Or, where proof of identity is required, as the name that is recorded on a majority of the higher point scoring documents that are produced as proof of identity.</p>
<i>Collection methods:</i>	<p>This metadata item should be recorded for all persons who receive services from or are of interest to an organisation. For the purposes of positive identification, it may also be recorded for providers of those services who are individuals.</p> <p>Mixed case should be used.</p> <p>Family name should be recorded in the format preferred by the person. The format should be the same as that written by the person on a (pre) registration form or in the same format as that printed on an identification card, such as a Medicare card, to ensure consistent collection of name data.</p>

It is acknowledged that some people use more than one family name (e.g. formal name, birth name, married/maiden name, tribal name) depending on the circumstances. Each name should be recorded against the appropriate Name type (see Comments).

A person is able to change his or her name by usage in all States and Territories of Australia with the exception of Western Australia, where a person may only change his or her name under the Change of Name Act. Care should be taken when recording a change of name for a minor. Ideally, the name recorded for the minor should be known to both of his/her parents, so the minor's records can be retrieved and continuity of care maintained, regardless of which parent accompanies the minor to the agency or establishment.

A person should generally be registered using their preferred name as it is more likely to be used in common usage and on subsequent visits to the agency or establishment. The person's preferred name may in fact be the name on their Medicare card. The Person name type metadata item can be used to distinguish between the different types of names that may be used by the person. The following format may assist with data collection:

What is your family name?

Are you known by any other family names that you would like recorded? If so, what are they

Please indicate, for each name above, the 'type' of family name that is to be recorded:

(a) Medicare card name (if different to preferred name).

(b) Alias (any other name that you are known by). Whenever a person informs the agency or establishment of a change of family name (e.g. following marriage or divorce), the former name should be recorded as an alias name. A full history of names should be retained. e.g. 'Mary Georgina Smith' informs the hospital that she has been married and changed her family name to 'Jones'. Record 'Jones' as her preferred family name and record 'Smith' as an alias name.

Hyphenated family names:

Sometimes persons with hyphenated family names use only one of the two hyphenated names. It is useful to record each of the hyphenated names as an alias. If the person has a hyphenated family name, e.g. 'Wilson-Phillips' record 'Wilson-Phillips' in the preferred family name field and record 'Wilson' and 'Phillips' separately as alias family names.

Punctuation:

If special characters form part of the family name they should be included, e.g. hyphenated names should be entered with a hyphen.

Examples:

- hyphen, e.g. Wilson-Phillips

Do not leave a space before or after a hyphen, i.e. between the

last letter of 'Wilson' and the hyphen, nor a space between the hyphen and the first letter of 'Phillips'.

- apostrophe, e.g. O'Brien, D'Agostino

Do not leave a space before or after the apostrophe, i.e. between the 'O' and the apostrophe, or a space between the apostrophe and 'Brien'.

- full stop, e.g. St. John, St. George

Do not leave a space before a full stop, i.e. between 'St' and the full stop. Do leave a space between the full stop and 'John'.

- space, e.g. van der Humm, Le Brun, Mc Donald

If the health care client has recorded their family name as more than one word, displaying spaces in between the words, record their family name in the same way leaving one space between each word.

Registered unnamed newborn babies:

When registering a newborn, use the mother's family name as the baby's family name unless instructed otherwise by the mother. Record unnamed babies under the newborn Name type.

Persons with only one name:

Some people do not have a family name and a given name, they have only one name by which they are known. If the person has only one name, record it in the 'Family name' field and leave the 'Given name' field blank.

Registering an unidentified person:

The default for unknown family name should be unknown in all instances and the name recorded as an alias name. Don't create a 'fictitious' family name such as 'Doe' as this is an actual family name. When the person's name becomes known, record it as the preferred family name and do not overwrite the alias name of unknown.

Registering health care clients from disaster sites:

Persons treated from disaster sites should be recorded under the alias Name Type. Local business rules should be developed for consistent recording of disaster site person details.

Care should be taken not to use identical dummy data (family name, given name, date of birth, sex) for two or more persons from a disaster site.

If the family name needs to be shortened:

If the length of the family name exceeds the length of the field, truncate the family name from the right (that is, dropping the final letters). Also, the last character of the name should be a hash (#) to identify that the name has been truncated.

Use of incomplete names or fictitious names:

Some health care facilities permit persons to use a pseudonym (fictitious or partial name) in lieu of their full or actual name. It is recommended that the person be asked to record both the pseudonym (Alias name) in addition to the person's Medicare card name.

Baby for **adoption**:

The word adoption should not be used as the family name, given name or alias for a newborn baby. A newborn baby that is for adoption should be registered in the same way that other newborn babies are registered. However, if a baby born in the hospital is subsequently adopted, and is admitted for treatment as a child, the baby is registered under their adopted (current) name, and the record should not be linked to the birth record. This should be the current practice. Any old references to adoption in client registers (for names) should also be changed to unknown. Contact your State or Territory adoption information service for further information.

Prefixes:

Where a family name contains a prefix, such as one to indicate that the person is a widow, this must be entered as part of the 'Family name' field. When widowed, some Hungarian women add 'Ozvegy' (abbreviation is 'Ozy') before their married family name, e.g. 'Mrs Szabo' would become 'Mrs Ozy Szabo'. That is, 'Mrs Szabo' becomes an alias name and 'Mrs Ozy Szabo' becomes the preferred name.

Ethnic Names:

The Centrelink publication, Naming Systems for Ethnic Groups, provides the correct coding for ethnic names.

Misspelled family name:

If the person's family name has been misspelled in error, update the family name with the correct spelling and record the misspelled family name as an alias name. Recording misspelled names is important for filing documents that may be issued with previous versions of the person's name. Discretion should be used regarding the degree of recording that is maintained.

Comments:

Often people use a variety of names, including legal names, married/maiden names, nicknames, assumed names, traditional names, etc. Even small differences in recording - such as the difference between MacIntosh and McIntosh - can make record linkage impossible. To minimise discrepancies in the recording and reporting of name information, agencies or establishments should ask the person for their full (formal) 'Given name' and 'Family name'. These may be different from the name that the person may prefer the agency or establishment workers to use in personal dealings. Agencies or establishments may choose to separately record the preferred names that the person wishes to be used by agency or establishment workers. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies or establishments should always ask the person to specify their first given name and their family name or surname separately. These should then be recorded as 'Given name' and 'Family name' as appropriate, regardless of the order in which they may be traditionally given.

National Community Services Data Dictionary specific:

Selected letters of the family name in combination with selected

letters of the given name, date of birth and sex, may be used for record linkage for statistical purposes only.

First day of the last menstrual period

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Pregnancy – first day of the last menstrual period, date DDMMYYYY
<i>METeOR identifier:</i>	270038
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Date of the first day of the mother's last menstrual period (LMP).
<i>Data Element Concept:</i>	Pregnancy – first day of the last menstrual period

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	If the first day is unknown, it is unnecessary to record the month and year (i.e. record 99999999).
<i>Comments:</i>	The first day of the LMP is required to estimate gestational age, which is a key outcome of pregnancy and an important risk factor for neonatal outcomes. Although the date of the LMP may not be known, or may sometimes be erroneous, estimation of gestational age based on clinical assessment may also be inaccurate. Both methods of assessing gestational age are required for analysis of outcomes.

<i>METeOR identifier:</i>	290264
<i>Registration status:</i>	Health, Standard 04/05/2005 Community services, Standard 30/09/2005
<i>Definition:</i>	The unique identifier for floor/level, where an organisation can be located.
Data Element Concept:	Service provider organisation (address) – floor/level identifier

Value domain attributes

Representational attributes

<i>Representation class:</i>	Identifier
<i>Data type:</i>	String
<i>Format:</i>	[NNNA]
<i>Maximum character length:</i>	4

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Floor/level number and suffix are both optional. The Floor/level number must be recorded with its corresponding Floor/level type. Some Floor/level numbers may be followed by an alphabetic suffix. Examples of Floor/level identification: FL 1A L 3 LG A
<i>Collection methods:</i>	Do not leave a space between the number and alpha suffix. To be collected in conjunction with Floor/level type.

Value	Meaning								
1	Yes								
2	No								
9	Not stated/inadequately described								
<i>Supplementary values:</i>									

Collection and usage attributes

<i>Guide for use:</i>	CODE 9 Not stated/inadequately described This code is not for use in primary data collections.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	CODE 1 Yes: Record if a foot deformity is present on either foot. CODE 2 No: Record if no foot deformity is present on either foot. Common deformities include claw toes, pes cavus, hallux valgus, hallux rigidus, hammer toe, Charcot foot and nail deformity.
<i>Collection methods:</i>	Both feet to be examined for the presence of foot deformity.
<i>Comments:</i>	Foot deformities are associated with high mechanical pressure on the overlying skin that lead to ulceration in the absence of protective pain sensation and when shoes are unsuitable. Limited joint mobility is often present, with displaced plantar fat pad and more prominent metatarsal heads.

<i>Supplementary values:</i>									

Collection and usage attributes

<i>Guide for use:</i>	CODE 9 Not stated/inadequately described This code is not for use in primary data collections.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	CODE 1 Yes: Record if a foot ulcer is currently present on either foot. CODE 2 No: Record if a foot ulcer is not currently present on either foot.
<i>Collection methods:</i>	Access whether the individual has a current foot ulcer on either foot. Assessment <ul style="list-style-type: none">ask the patient about previous or current foot problems, neuropathic symptoms, rest pain and intermittent claudication;inspect the feet (whole foot, nails, between the toes) to identify active foot problems and the 'high-risk foot';assess footwear;

- check peripheral pulses;
- examine for neuropathy by testing reflexes and sensation preferably using tuning fork, 10 g monofilament and/or biothesiometer.

Comments:

Foot ulcer is usually situated on the edge of the foot or toes because blood supply is the poorest at these sites. In a purely vascular ulcer, nerve function is normal and sensation is intact, hence vascular ulcers are usually painful.

Foot ulcers require urgent care from an interdisciplinary team, which may include a general practitioner, podiatrist, endocrinologist physician, nurse or surgeon.

Full-time equivalent staff (mental health)—all staff

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment (mental health) – full-time equivalent staff (paid), total N[NNN{.N}]
<i>METeOR identifier:</i>	296553
<i>Registration status:</i>	Health, Standard 08/12/2004
<i>Definition:</i>	The aggregate full-time equivalent staff units paid for all staffing categories within a mental health establishment.
Data Element Concept:	Establishment – full-time equivalent staff (paid)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN{.N}]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Full-time equivalent (FTE) staff
<i>Unit of measure precision:</i>	1

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>The total is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.</p> <p>Full-time equivalent staff units are the on-job hours paid for (including overtime) and hours of paid leave of any type for a staff member (or contract employee where applicable) divided by the number of ordinary-time hours normally paid for a full-time staff member when on the job (or contract employee where applicable) under the relevant award or agreement for the staff member (or contract employee occupation where applicable). Hours of unpaid leave are to be excluded.</p> <p>Contract staff employed through an agency are included where the contract is for the supply of labour (e.g. nursing) rather than of products (e.g. photocopier maintenance). In the former case, the contract would normally specify the amount of labour supplied and could be reported as full-time equivalent units.</p>
<i>Collection methods:</i>	<p>Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.</p> <p>Where staff provide services to more than one hospital (for Public</p>

hospitals NMDS) or service unit (for Mental health establishments NMDS), full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments:

This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Full-time equivalent staff—average

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment – full-time equivalent staff (paid), average N[NNN{.N}]
<i>METeOR identifier:</i>	270543
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The average number of full-time equivalent staff units paid for all staffing categories within an establishment.
Data Element Concept:	Establishment – full-time equivalent staff (paid)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN{.N}]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Full-time equivalent (FTE) staff

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Calculated by adding the full-time equivalents for each staffing category listed below:</p> <ul style="list-style-type: none">C1.1 Salaried medical officersC1.2 Registered nursesC1.3 Enrolled nursesC1.4 Student nursesC1.5 Trainee/pupil nursesC1.6 Other personal care staffC1.7 Diagnostic and health professionalsC1.8 Administrative and clerical staffC1.9 Domestic and other staff <p>The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.</p> <p>If under the relevant award of agreement a full-time nurse is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time nurse who works 64 hours is 0.8. If a full-time nurse under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.</p> <p>Data on full-time equivalent staffing numbers by category should</p>
-----------------------	--

be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Full-time equivalent staff units are the on-job hours paid for (including overtime) and hours of paid leave of any type for a staff member (or contract employee where applicable) divided by the number of ordinary-time hours normally paid for a full-time staff member when on the job (or contract employee where applicable) under the relevant award or agreement for the staff member (or contract employee occupation where applicable). Hours of unpaid leave are to be excluded.

Contract staff employed through an agency are included where the contract is for the supply of labour (e.g. nursing) rather than of products (e.g. photocopier maintenance). In the former case, the contract would normally specify the amount of labour supplied and could be reported as full-time equivalent units.

Comments:

This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Includes general enrolled nurse and specialist enrolled nurse (e.g. mothercraft nurses in some states).</p> <p>The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.</p> <p>If under the relevant award of agreement a full-time nurse is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time nurse who works 64 hours is 0.8. If a full-time nurse under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.</p> <p>Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.</p> <p>Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).</p>
-----------------------	--

Comments: This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Full-time equivalent staff—salaried medical officers

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment – full-time equivalent staff (paid) (salaried medical officers), average N[NNN{.N}]
<i>METeOR identifier:</i>	270494
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The average number of full-time equivalent staff units paid for all salaried medical officers within an establishment.
Data Element Concept:	Establishment – full-time equivalent staff (paid) (salaried medical officers)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Average
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN{.N}]
<i>Maximum character length:</i>	5
<i>Unit of measure:</i>	Full-time equivalent (FTE) staff

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Medical officers employed by the hospital on a full time or part time salaried basis. This excludes visiting medical officers engaged on an honorary, sessional or fee for service basis.</p> <p>This metadata item includes salaried medical officers who are engaged in administrative duties regardless of the extent of that engagement (for example, clinical superintendent and medical superintendent).</p> <p>The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.</p> <p>If under the relevant award of agreement a full-time employee is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time employee who works 64 hours is 0.8. If a full-time employee under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.</p> <p>Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.</p>
-----------------------	---

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

If under the relevant award of agreement a full-time nurse is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time nurse who works 64 hours is 0.8. If a full-time nurse under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.

Comments:

This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

3	Fixed perfusion or wall motion defects only																
4	Reversible perfusion or wall motion defects only																
5	Fixed and reversible perfusion and wall motion defects																
6	Equivocal																
9	Not stated/inadequately described																
<i>Supplementary values:</i>																	

Collection and usage attributes

<i>Guide for use:</i>	<p>Depending on the method used for the stress test, and therefore the way the results are viewed, some of these codes will not be applicable. For example where an ECG was used for the stress test codes 3, 4 and 5 will not be applicable.</p> <p>CODE 1 No abnormal outcome</p> <p>Use this code when the stress test result identifies no evidence of ischaemia (i.e. no typical angina pain and no ST shifts).</p> <p>CODE 2 Ischaemic discomfort and/or ST shift</p> <p>Use this code when the stress test result identifies either:</p> <ul style="list-style-type: none">• Both ischaemic discomfort and ST shift greater than or equal to 1 mm (0.1 mV) (horizontal or downsloping); or• new ST shift greater than or equal to 2 mm (0.2 mV) (horizontal or down-sloping) believed to represent ischaemia even in the absence of ischaemic discomfort.
-----------------------	---

This code only applies to stress tests where no imaging component was performed.

CODE 3 Fixed perfusion or wall motion defects only

Use this code when the stress test result identifies fixed perfusion defects only. This means the presence of non-viable myocardium with no areas of inducible ischaemia during functional stress testing.

This code only applies to stress tests where an imaging component was performed.

CODE 4 Reversible perfusion or wall motion defects only

Use this code when the stress test result identifies reversible perfusion defects only. This means the presence of inducible defects in myocardial perfusion with underlying viable myocardium in all areas.

This code only applies to stress tests where an imaging component was performed.

CODE 5 Fixed and reversible perfusion or wall motion defects

Use this code when the stress test result identifies reversible and fixed perfusion defects. This means the presence of non-viable myocardial areas, together with areas of inducible defects in reperfusion.

This code only applies to stress tests where an imaging component was performed.

CODE 6 Equivocal

Use this code when the stress test result identifies either:

- Typical ischaemic pain but no ST shift greater than or equal to 1 mm (0.1 mV) (horizontal or downsloping); OR ST shift of 1 mm (0.1 mV) (horizontal or downsloping) but no ischaemic discomfort.
- Defect on myocardial imaging of uncertain nature or significance.

<i>Guide for use:</i>	CODE 01 Australian Health Care Agreements Australian Health Care Agreements should be recorded as the funding source for Medicare eligible admitted patients who elect
-----------------------	---

to be treated as public patients and Medicare eligible emergency department patients and Medicare eligible patients presenting at a public hospital outpatient department for whom there is not a third party arrangement.

Includes: Public admitted patients in private hospitals funded by state or territory health authorities (at the state or regional level).

Excludes: Inter-hospital contracted patients and overseas visitors who are covered by Reciprocal health care agreements and elect to be treated as public admitted patients.

CODE 02 Private health insurance

Excludes: overseas visitors for whom travel insurance is the major funding source.

CODE 03 Self-funded

This code includes funded by the patient, by the patient's family or friends, or by other benefactors.

CODE 10 Other hospital or public authority

Includes: Patients receiving treatment under contracted care arrangements (Inter-hospital contracted patient).

CODE 11 Reciprocal health care agreements (with other countries)

Australia has Reciprocal Health Care Agreements with the United Kingdom, the Netherlands, Italy, Malta, Sweden, Finland, Norway, New Zealand and Ireland. The Agreements provide for free accommodation and treatment as public hospital services, but do not cover treatment as a private patient in any kind of hospital.

- The Agreements with Finland, Italy, Malta, the Netherlands, Norway, Sweden and the United Kingdom provide free care as a public patient in public hospitals, subsidised out-of-hospital medical treatment under Medicare, and subsidised medicines under the Pharmaceutical Benefits Scheme.

- The Agreements with New Zealand and Ireland provide free care as a public patient in public hospitals and subsidised medicines under the Pharmaceutical Benefits Scheme, but do not cover out-of-hospital medical treatment.

- Visitors from Italy and Malta are covered for a period of six months from the date of arrival in Australia only.

Excludes: Overseas visitors who elect to be treated as private patients.

CODE 12 Other funding source

Includes: Overseas visitors for whom travel insurance is the major funding source.

CODE 13 No charge

Includes: Admitted patients who are Medicare ineligible and receive public hospital services free of charge at the discretion of the hospital or the state/territory. Also includes patients who receive private hospital services for whom no accommodation or facility charge is raised (for example, when the only charges are

for medical services bulk-billed to Medicare), and patients for whom a charge is raised but is subsequently waived.

Excludes: Admitted public patients (Medicare eligible) whose funding source should be recorded as Australian Health Care Agreements or Reciprocal Health Care Agreements. Also excludes Medicare eligible non-admitted patients, presenting to a public hospital emergency department and Medicare eligible patients (for whom there is not a third party payment arrangement) presenting at a public hospital outpatient department, whose funding source should be recorded as Australian Health Care Agreements.

Also excludes patients presenting to an outpatient department who have chosen to be treated as a private patient and have been referred to a named medical specialist who is exercising a right of private practice. These patients are not considered to be patients of the hospital (see Guide for use).

Data element attributes

Collection and usage attributes

Guide for use:

If there is an expected funding source followed by a finalised actual funding source (for example, in relation to compensation claims), then the actual funding source known at the end of the reporting period should be recorded.

The expected funding source should be reported if the fee has not been paid but is not to be waived.

If a charge is raised for accommodation or facility fees for the episode/service event, the intent of this data element is to collect information on who is expected to pay, provided that the charge would cover most of the expenditure that would be estimated for the episode/service event. If the charge raised would cover less than half of the expenditure, then the funding source that represents the majority of the expenditure should be reported.

The major source of funding should be reported for nursing-home type patients.

99	Not stated/unknown				
<i>Unit of measure:</i>	Completed weeks				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Gestational age is the best clinical estimate of the duration of pregnancy at a specific point in time, based on the first day of the last menstrual period, ultrasound or physical examination of the baby.</p> <p>Gestational age is conventionally expressed in completed weeks. When gestational age is calculated using the first day of the last normal menstrual period, the first day is counted as day zero and not day one. Therefore, a 25 week, 5 day fetus is considered a 25 week fetus (25+0, 25+1, 25+2, 25+3, 25+4, 25+5, 25+6).</p> <p>When ultrasound is used to date a pregnancy, the earliest ultrasound examination should be used and should preferably be between 6 and 10 weeks gestation. Scans performed beyond 24 weeks gestation are unlikely to be reliable in estimating gestational age and should not be used for this purpose.</p> <p>The duration of gestation can be determined from the first day of the last normal menstrual period, from ultrasound or clinical assessment. For the purpose of the national collection, gestational age is expressed in completed weeks.</p> <p>The World Health Organisation identifies the following categories:</p> <ul style="list-style-type: none">• pre-term: less than 37 completed weeks (less than 259 days) of gestation;
-----------------------	---

- term: from 37 completed weeks to less than 42 completed weeks (259 to 293 days) of gestation; and
- post-term: 42 completed weeks or more (294 days or more) of gestation.

Comments: Gestational age is a key marker in pregnancy and an important risk factor for neonatal outcomes.

<i>Data type:</i>	String
<i>Format:</i>	[X(40)]
<i>Maximum character length:</i>	40

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A person may have more than one Given name. All given names should be recorded.</p> <p>The agency or establishment should record the person's full given name(s) on their information systems.</p> <p>National Community Services Data Dictionary specific:</p> <p>In instances where there is uncertainty about which name to record for a person living in a remote Aboriginal or Torres Strait Islander community, Centrelink follows the practice of recording the Indigenous person's name as it is first provided to Centrelink. In situations where proof of identity is required, the name is that recorded on a majority of the higher point scoring documents that are produced as proof of identity.</p> <p>National Health Data Dictionary specific:</p> <p>Each individual Given name should have a Given name sequence number associated with it.</p> <p>Health care establishments may record given names (first and other given names) in one field or several fields. This metadata item definition applies regardless of the format of data recording.</p> <p>A full history of names is to be retained.</p>
<i>Collection methods:</i>	<p>This metadata item should be recorded for all clients.</p> <p>Given name(s) should be recorded in the format preferred by the</p>

person. The format should be the same as that indicated by the person (for example written on a form) or in the same format as that printed on an identification card, such as Medicare card, to ensure consistent collection of name data.

It is acknowledged that some people use more than one given name (for example formal name, birth name, nickname or shortened name, or tribal name) depending on the circumstances. A person is able to change his or her name by usage in all States and Territories of Australia with the exception of Western Australia, where a person may only change his or her name under the Change of Name Act.

A person should generally be registered using their preferred name as it is more likely to be used in common usage and on subsequent visits to the agency or establishment. The person's preferred name may in fact be their legal (or Medicare card) name. The Person name type metadata item (see Comments) can be used to distinguish between the different types of names that may be used by the person.

The following format may assist with data collection:

What is the given name you would like to be known by?

Are you known by any other given names that you would like recorded?

If so, what are they

Please indicate the 'type' of given name that is to be recorded:

- (a) Medicare card name (if different to preferred name).
- (b) Alias (any other name that you are known by).

Whenever a person informs the agency or establishment of a change of given name (for example prefers to be known by their middle name), the former name should be recorded according to the appropriate name type. Do not delete or overwrite a previous given name. For example 'Mary Georgina Smith' informs the hospital that she prefers to be known as 'Georgina'. Record 'Georgina' as her preferred given name and record 'Mary' as the Medicare card given name.

Similarly the establishment is informed that 'Baby of Louise Jones' has been named 'Mary Jones'. Retain 'Baby of Louise' as the newborn name and also record 'Mary' as the preferred 'Given name'.

Registering an unidentified health care client:

If the person is a health care client and her/his given name is not known record unknown in the 'Given name' field and use alias Name type. When the person's name becomes known, add the actual name as preferred Name type (or other as appropriate). Do not delete or overwrite the alias name of unknown.

Use of first initial:

If the person's given name is not known, but the first letter (initial) of the given name is known, record the first letter in the preferred 'Given name' field. Do not record a full stop following the initial.

Persons with only one name:

Some people do not have a **family** name and a given name: they have only one name by which they are known. If the person has only one name, record it in the 'Family name' field and leave the 'Given name' blank.

Record complete information:

All of the person's given names should be recorded.

Shortened or alternate first given name:

If the person uses a shortened version or an alternate version of their first given name, record their preferred name, the actual name as their Medicare card name and any alternative versions as alias names as appropriate.

Example - The person's given name is Jennifer but she prefers to be called Jenny. Record 'Jenny' as the preferred 'Given name' and 'Jennifer' as her Medicare card name.

Example - The person's given name is 'Giovanni' but he prefers to be called 'John'.

Record 'John' as the preferred 'Given name' and 'Giovanni' as the Medicare card name.

Punctuation:

If special characters form part of the given names they shall be included, e.g. hyphenated names shall be entered with the hyphen.

- Hyphen, for example Anne-Maree, Mary-Jane

Do not leave a space before or after the hyphen, that is between last letter of 'Anne' and the hyphen, nor a space between the hyphen and the first letter of 'Maree'.

- spaces, for example Jean Claude Marcel Moreaux

If the person has recorded their given name as more than one word, displaying spaces in between the words, record their given names in data collection systems in the same way (that is Jean Claude is one given name and Marcel is another given name).

Names not for continued use:

For cultural reasons, a person such as an Aboriginal or Torres Strait Islander may advise that they are no longer using the given name they previously used and are now using an alternative current name. Record their current name as their preferred given name and record their previously used name as an alias name (with a Name conditional use flag of 'not for continued use').

Composite name:

If a person identifies their first name as being a composite word, both parts should be recorded under the first Given Name (rather than the first and second Given Name).

If 'Anne Marie Walker' notes her preferred Given Name to be 'Anne Marie', then 'Anne Marie' is recoded as (first) Given Name, and (second) Given Name is left blank.

Registering an unnamed newborn baby:

An unnamed (newborn) baby is to be registered using the mother's given name in conjunction with the prefix 'Baby of'. For example, if

the baby's mother's given name is Fiona, then record 'Baby of Fiona' in the preferred 'Given name' field for the baby. This name is recorded under the newborn Name type. If a name is subsequently given, record the new name as the preferred given name and retain the newborn name.

Registering unnamed multiple births:

An unnamed (newborn) baby from a multiple birth should use their mother's given name plus a reference to the multiple births. For example, if the baby's mother's given name is 'Fiona' and a set of twins is to be registered, then record 'Twin 1 of Fiona' in the Given name field for the first born baby, and 'Twin 2 of Fiona' in the 'Given name' field of the second born baby. Arabic numbers (1, 2, 3 ...) are used, not Roman Numerals (I, II, III).

In the case of triplets or other multiple births the same logic applies. The following terms should be use for recording multiple births:

- Twin:
use Twin, that is Twin 1 of Fiona
- Triplet:
use Trip, that is Trip 1 of Fiona
- Quadruplet:
use Quad, that is Quad 1 of Fiona
- Quintuplet:
use Quin, that is Quin 1 of Fiona
- Sextuplet:
use Sext, that is Sext 1 of Fiona
- Septuplet:
use Sept, that is Sept 1 of Fiona.

These names should be recorded under the newborn Person name type. When the babies are named, the actual names should be recorded as the preferred name. The newborn name is retained.

Ethnic Names:

The Centrelink Naming Systems for Ethnic Groups publication provides the correct coding for ethnic names. Refer to Ethnic Names Condensed Guide for summary information.

Misspelled given names:

If the person's given name has been misspelled in error, update the Given name field with the correct spelling and record the misspelled given name as an Alias name. Recording misspelled names is important for filing documents that may be issued with previous versions of the client's name. Discretion should be used regarding the degree of recording that is maintained.

Comments:

Often people use a variety of names, including legal names, married/maiden names, nicknames, assumed names, traditional names, etc. Even small differences in recording - such as the difference between Thomas and Tom - can make Record linkage impossible. To minimise discrepancies in the recording and reporting of name information, agencies or establishments should

ask the person for their full (formal) Given name and Family name. These may be different from the name that the person may prefer the agency or establishment workers to use in personal dealings. Agencies or establishments may choose to separately record the preferred name that the person wishes to be used by agency or establishment workers. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies or establishments should always ask the person to specify their first given name and their family or surname separately. These should then be recorded as Given name and Family name as appropriate, regardless of the order in which they may be traditionally given.

National Community Services Data Dictionary specific:

Selected letters of the given name in combination with selected letters of the family name, date of birth and sex may be used for **record linkage** for statistical purposes only.

National Health Data Dictionary specific:

Health care provider identification DSS and Health care client identification DSS

For the purpose of positive identification or contact, agencies or establishments that collect Given name should also collect Given name sequence number. Given name sequence number is also a metadata item in Australian Standard AS4846-2004 Health care provider identification and is proposed for inclusion in the review of Australian Standard AS5017-2002 Health care client identification. AS5017 and AS4846 use alternative alphabetic codes for Given name sequence number. Refer to the current standards for more details.

07	For assessment only/not applicable																

Collection and usage attributes

<i>Guide for use:</i>	CODE 01 Well person for preventative/maintenance/health promotion program Service recipients are those making contact with the health service primarily as a part of a preventative/maintenance health promotion program. This means they are well and do not require care for established health problems. They include well antenatal persons attending or being seen by the service for screening or health education purposes.
-----------------------	---

CODE 02 Person will make a complete recovery

Describes those persons whose condition is self-limiting and from which complete recovery is anticipated, or those with established or long-term health problems who are normally independent in their management.

Goal 2 service recipient includes:

- post-surgical or acute medical service recipients whose care at home is to facilitate convalescence. Such admissions to home care occur as a result of early discharge from hospital; post-surgical complication such as wound infection; or because the person is at risk during the recovery phase and requires surveillance for a limited period;
- persons recovering from an acute illness and referred from the general practitioner or other community-based facility;
- persons with **disability** or established health problem normally independent of health services, and currently recovering from an acute condition or illness as above.

CODE 03 Person will not make a complete recovery; but will rehabilitate to a state where formal on-going service is no longer required

Refers to those service recipients whose care plan is aimed at returning them to independent functioning at home either through self-care or with informal assistance, such that formal services will be discontinued. The distinguishing characteristic of this group is that complete recovery is not expected but some functional gain may be possible. Further, the condition is not expected to deteriorate rapidly or otherwise cause the client to be at risk without contact or surveillance from the community service.

CODE 04 Person has a long-term care need and the goal is aimed at on-going support to maintain at home

Refers to those service recipients whose health problem/condition is not expected to resolve and who will require ongoing maintenance care from the nursing service. Such clients are distinguished from those in Goal 3 in that their condition is of an unknown or long-term nature and not expected to cause death in the foreseeable future. They may require therapy for restoration of function initially and intermittently, and may also have intermittent admissions for respite. However, the major part of their care is planned to be at home.

CODE 05 Person in end-stage of illness the goal is aimed at support to stay at home in comfort and dignity and facilitation of choice of where to die

Refers to persons whose focus of care is palliation of symptoms and facilitation of the choice to die at home.

CODE 06 Person is unable to remain at home for extended period and goal is aimed at institutionalisation at a planned and appropriate time

Includes persons who have a limited ability to remain at home because of their intensive care requirements and the inability of formal and informal services to meet these needs. Admission to institutional care is therefore a part of the care planning process and the timing dependent upon the capacity and/or wish to remain at home. The distinguishing feature of this group is that the admission is not planned to be an intermittent event to boost the capacity for home care but is expected to be of a more permanent (or indeterminate) nature.

- Excluded from this group are persons with established health problems or permanent disability, if the contact is related to the condition. For example, persons with diabetes and in a diabetes program would be included in Goal 3; however, such persons would be included in Goal 6 if the contact with the service is not related to an established health problem but is primarily for preventative/maintenance care as described above.

CODE 07 For assessment only/not applicable

Service recipients are those for whom the reason for the visit is to undertake an assessment. This may include clients in receipt of a Domiciliary Nursing Care Benefit (DNCB) for whom the purpose of the visit is to determine ongoing DNCB eligibility and requirements for care. Implicit in this visit is review of the person's health status and circumstances, to ensure that their ongoing support does not place them or their carer at avoidable risk.

Data element attributes

Collection and usage attributes

Guide for use:

Only one option is permissible and where Code 07 is selected, Code 9 must be used in the metadata item Community nursing service episode – nursing interventions, code N.

Collection methods:

At time of formal review of the client, the original goal of care should be retained and not over-written by the system. The goal of care relates to the episode bounded by the date of first contact with community nursing service and date of last contact and in this format provides a focussing effect at the time of planning for care.

Comments:

Agencies who had previously implemented this metadata item should note changes to the code set in the Value domain.

Collection and usage attributes

Guide for use: Where the exact dollar amount, for accommodations services as a whole, is unable to be provided an estimate should be derived from available local information.

Note: Only subtypes 3 and 5 are included as 'Accommodation services' for the Mental Health Establishments NMDS. Subtypes 1, 2 and 4 are not included as 'Accommodation services' for this NMDS. Categories 3 and 5 listed below are to be reported in aggregate. Where data are unavailable on grant amounts for specific service types, the value of grants not allocatable to specific service types should be reported under the other and unspecified services grants to non-government organisations data element.

Accommodation services are subcategorised into 5 subtypes:

1. *Crisis/interim accommodation* - Short-term accommodation which may be staffed up to 24 hours a day, seven days a week for people affected by a mental health issue. Accommodation is facility based/residential with an

average of 4-8 beds. Length of stay is generally limited to a maximum of three months.

2. *Transitional supported accommodation* - Short to medium accommodation (3-12 months) that is provided in a residential/facility based setting.
3. *Headleasing* - Provides a supportive landlord service that assists tenants to access and maintain suitable accommodation and maintains their tenancies and which is linked to support.
4. *Residential rehabilitation* - Short to long-term residential facility based accommodation provided to people with high needs. Staff support is provided.
5. *Long term supported accommodation* - Secure/tenured long-term accommodation with staff support as necessary or desired.

Collection methods:

Grants for accommodation services are to be reported at the lowest statistical unit level at which the expenditure occurred (state/territory or region), and should not be counted at more than one level.

Grants to non-government organisations—community awareness/health promotion services

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Specialised mental health service organisation—community awareness/health promotion services grants to non-government organisations (financial year), total Australian currency N[N(8)]
<i>METeOR identifier:</i>	287011
<i>Registration status:</i>	Health, Standard 08/12/2004
<i>Definition:</i>	Grants made to non-government organisations for community awareness/health promotion services, defined as services aimed at raising awareness about mental health/illness and those affected by mental health issues through the provision of information and/or education to the community, in order to enhance the community's capacity to support people affected by a mental health issue.
Data Element Concept:	Specialised mental health service organisation—community awareness/health promotion services grants to non-government organisations

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Currency
<i>Format:</i>	N[N(8)]
<i>Maximum character length:</i>	9
<i>Unit of measure:</i>	Australian currency (AU\$)

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Where the exact dollar amount for community awareness/health promotion services is unable to be provided an estimate should be derived from available local information. Where data are unavailable on grant amounts for specific service types, the value of grants not allocatable to specific service types should be reported under other and unspecified services grants to non-government organisations.
<i>Collection methods:</i>	Grants for community awareness/health promotion services are to be reported at the lowest statistical unit level at which the expenditure occurred (state/territory or region), and should not be counted at more than one level.

<i>Unit of measure:</i>	Australian currency (AU\$)

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Where the exact dollar amount for self-help support groups services is unable to be provided an estimate should be derived from available local information. Where data are unavailable on grant amounts for specific service types, the value of grants not allocatable to specific service types should be reported under other and unspecified services grants to non-government organisations.
<i>Collection methods:</i>	Grants for self-help support group expenditure are to be reported at the lowest statistical unit level at which the expenditure occurred (state/territory or region), and should not be counted at more than one level.

Relational attributes

<i>Data type:</i>	Number
<i>Format:</i>	N[NNNNNN]
<i>Maximum character length:</i>	7
<i>Unit of measure:</i>	Occasion of service

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Emergency patients and outpatients are persons who receive non-admitted care. Group session non-admitted care is care provided to persons who receive direct care within the emergency department or other designated clinics within the hospital and who are not formally admitted at the time when the care is provided. A person who first contacts the hospital and receives non-admitted care, for example through the emergency department, and is subsequently admitted should have both components of care enumerated separately.

<i>Unit of measure:</i>	Group session

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Each group is to be counted once, irrespective of size or the number of staff providing services.</p> <p>A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p>
<i>Comments:</i>	<p>This metadata item is derived from metadata items that are not currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.</p> <p>This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.</p>

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection and usage attributes

<i>Guide for use:</i>	<p>Allied health services include units primarily concerned with physiotherapy, family planning, dietary advice, optometry, occupational therapy, and so on.</p> <p>Each group is to be counted once, irrespective of size or the number of staff providing services.</p> <p>A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p>
<i>Collection methods:</i>	<p>At present, occasions of service to groups are counted in an inconsistent manner. The numbers of occasions of service should be collected for both individual and group sessions for public psychiatric hospitals and alcohol and drug hospitals.</p>

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients. This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary.

For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

This metadata item is derived from metadata items that are not currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection and usage attributes

<i>Guide for use:</i>	<p>District nursing services:</p> <ul style="list-style-type: none">• are for medical/nursing/psychiatric care• are provided by a nurse, paramedic or medical officer• involve travel by the service provider• exclude care provided by staff from a unit classified in the community health category. <p>Each group is to be counted once, irrespective of size or the number of staff providing services.</p> <p>A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p>
-----------------------	---

Collection methods:

At present, occasions of service to groups are counted in an inconsistent manner. The numbers of occasions of service should be collected for both individual and group sessions for public psychiatric hospitals and alcohol and drug hospitals.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients. This distinction creates difficulties for community health centres.

These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary.

For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

Collection and usage attributes

<i>Guide for use:</i>	<p>Includes ECG, obstetrics, nuclear medicine, general surgery, fertility, and so on.</p> <p>Each group is to be counted once, irrespective of size or the number of staff providing services.</p> <p>A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p>
<i>Collection methods:</i>	At present, occasions of service to groups are counted in an inconsistent manner. The numbers of occasions of service should be collected for both individual and group sessions for public psychiatric hospitals and alcohol and drug hospitals.
<i>Comments:</i>	This metadata item is derived from metadata items that are not

currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Guide for use:

Main Health Care Service organisation

CODE 101 Hospital – public

An organisation comprised of a health care facility or group of health care facilities established under Commonwealth, state or territory legislation as a hospital or free-standing day hospital facility and authorised to provide treatment and/or care to patients. Comprises all health care facilities that are reported as public hospitals to the Public Hospital Establishments National Minimum Data Set (PHE NMDS). This includes organisations such as rehabilitation hospitals; psychiatric hospitals; mothercraft hospitals; and hospices and multi-purpose services defined as hospitals. The list of public hospitals reported to the PHE NMDS is available at www.aihw.gov.au/publications/index.cfm in the Australian Hospital Statistics annual report.

NOTE 1: Excludes providers of services where those services are not captured in the hospital financial statements. For example, the provider of a pathology or pharmacy service may be co-located within the hospital, but as a private service, and will pay the hospital for use of the site. The provider of this pathology or pharmacy service would be recorded under codes 106 to 112.

CODE 102 Hospital – private (excluding private free-standing day hospital facilities)

An organisation comprised of a health care facility or a group of health care facilities established under Commonwealth, state or territory legislation as a hospital and authorised to provide treatment and/or care to patients.

Comprises hospitals that are NOT reporting to the PHE NMDS.

NOTE: State and territory data providers are to refer to the GHE NMDS Collection Guidelines for instructions on how to report expenditure for this category.

Excludes private free-standing day hospital facilities reported under code 103.

CODE 103 Hospital - private free-standing day facility
(excluding private non free-standing day hospital facilities)

An organisation comprised of one or more private free-standing day hospital facilities which provide investigation and treatment for acute conditions on a day-only basis and is approved by the Commonwealth as a hospital for the purposes of private health insurance benefits. The four main types of private free-standing day hospitals are specialist endoscopy, ophthalmic, plastic/cosmetic and general. Excludes private non free-standing day hospital facilities reported under code 102.

CODE 104 Residential facility – mental health care

An organisation comprised of one or more specialised mental health facilities primarily engaged in providing residential care to persons requiring mental health diagnosis and treatment combined with either nursing, supervisory or other types of care as required (including medical) by the residents.

Excludes residential care facilities primarily providing aged care or care for persons requiring treatment for alcohol or other substance abuse or persons with a disability.

CODE 105 Residential facility – other

Includes all government-funded facilities primarily engaged in providing residential care to persons requiring diagnosis and treatment for alcohol and other substance abuse combined with either nursing, supervisory or other types of care as required (including medical) by the residents. Includes hospices that are not defined as hospitals and respite and transitional care services.

Excludes facilities primarily providing services to aged persons or persons requiring mental health diagnosis and treatment.

Also excludes residential care facilities that report under the Commonwealth, State and Territory Disability Agreement where the primary purpose is care for persons with a disability.

CODE 106 Provider of ambulance service

Organisations primarily engaged in providing transportation of patients by ground or air, along with health (or medical) care. These services are often provided during a medical emergency but are not restricted to emergencies. The vehicles are equipped with lifesaving equipment operated by medically trained personnel. Includes organisations providing public ambulance services or flying doctor services such as Royal Flying Doctor Service and Care Flight, and support programs to assist isolated patients with travel to obtain specialised health care.

NOTE 2: Excludes providers of services where those services are captured in public or private hospital financial statements. For example, the provider of an ambulance, medical or diagnostic

laboratory, general practice, specialist medical, dental or other health practitioner service may be located within a hospital set of accounts and its expenditure recorded on the hospital financial statement. The provider of the ambulance or other service would then be recorded under code 101.

CODE 107 Medical and diagnostic laboratory

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in providing analytic or diagnostic services, including body fluid analysis and diagnostic imaging, generally to the medical profession or the patient on referral from a health practitioner. Includes diagnostic imaging centres; dental or medical X-ray laboratories ultrasound services; medical testing laboratories; medical pathology laboratories; medical forensic laboratories; and X-ray clinic services. Includes public and private medical and diagnostic laboratories.

See NOTE 2 under code 106.

CODE 108 Clinical practices – medical – general

Organisations of registered medical practitioners holding the degree of a Doctor of medicine or a qualification at a corresponding level primarily engaged in the independent practice of general medicine. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or medical centres.

See NOTE 2 under code 106.

This item is not currently required to be reported by state and territory health authorities.

CODE 109 Clinical practices – medical – specialist

This item is not currently required to be reported by state and territory health authorities.

Organisations of health practitioners holding the degree of a Doctor of medicine or a qualification at a corresponding level primarily engaged in the independent practice of specialist medicine or surgery, other than pathology and diagnostic imaging services. These practitioners operate a wide range of specialities in private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or health maintenance type medical centres. Includes for example:

- Anaesthetist service
- Dermatology service
- Ear, nose and throat specialist service
- Gynaecology service
- Neurology service
- Obstetrics service
- Paediatric service
- Psychiatry service
- Specialist medical clinic service

- Specialist surgical service
See NOTE 2 under code 106.

CODE 110 Clinical practices – medical – other

This item is not currently required to be reported by state and territory health authorities.

Includes organisations of physicians not able to be allocated to Codes 108 or 109

CODE 111 Clinical practices – dental

Organisations of registered health practitioners holding the degree of Doctor of dental medicine or a qualification at a corresponding level primarily engaged in the independent practice of general or specialised dentistry or dental surgery. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals, medical centres or community health facilities. They can provide either comprehensive preventive, cosmetic, or emergency care, or specialise in a single field of dentistry. Also included are dental hospitals providing ambulatory services only. Includes for example:

- Cleft lip and palate services
- Community dental service
- Dental assessment and treatment
- Dental hospital (out-patient)
- Dental practice service
- Dental practitioner service
- Dental surgery service
- Endodontic service
- Oral and maxillofacial services
- Oral pathology service
- Oral surgery service
- Orthodontic service
- Pedodontic service
- Periodontic service

See NOTE 2 under code 106.

CODE 112 Clinical practices – other

This item is not currently required to be reported by state and territory health authorities.

Organisations of independent health practitioners (other than physicians and dentists), such as chiropractors, optometrists, mental health specialists, physical, occupational, and speech therapists and audiologists organisations primarily engaged in providing **ambulatory** health care. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or medical centres. Includes for example:

- Acupuncture service

- Aromatherapy service
- Audiology service
- Chiropractic service
- Clinical psychology service
- Dental hygiene service
- Dietician service
- Hearing aid dispensing
- Homoeopathic service
- Midwifery service
- Naturopathic service
- Nursing service
- Occupational therapy service
- Optometrist
- Osteopathic service
- Podiatry service
- Speech pathology service
- Therapeutic massage service

See NOTE 2 under code 106.

CODE 113 Community health facility – substance abuse

Organisations with health staff primarily engaged in providing ambulatory services related to the diagnosis and treatment of alcohol and other substance abuse. These are community-based organisations that treat patients who do not require admitted patient treatment. They may provide counselling staff and information regarding a wide range of substance abuse issues and/or refer patients to more extensive treatment programmes, if necessary. Includes for example:

- Community based alcoholism treatment centres and clinics (other than hospitals or residential care facilities);
- Community based detoxification centre and clinics (other than hospitals or residential care facilities);
- Community based drug addiction treatment centres and clinics (other than hospitals or residential care facilities);
- Community based substance abuse treatment centres and clinics (other than hospitals or residential care facilities).

CODE 114 Community health facility – mental

An organisation comprised of one or more specialised mental health services or facilities with health staff primarily engaged in providing ambulatory services related to the diagnosis and treatment of mental health disorders. These specialised mental health services generally treat patients who do not require admitted patient treatment. However, these services do include consultation/liaison services provided to admitted patients by community mental health services. They may provide counselling staff and information regarding a wide range of

mental health issues and/or refer patients to more extensive treatment programmes, if necessary. They may also provide treatment both on and off site, for example through mobile units. Includes only government-funded specialised mental health services, such as community mental health centres and clinics.

Includes expenditure on government-managed community specialised mental health services, plus the cost of the grants to non-government organisations that provide community specialised mental health services, not the total expenditure by these non-government organisations.

Excludes mental health clinics in hospitals and residential mental health care facilities.

CODE 115 Community health facility – other

Organisations with health staff primarily engaged in providing general or specialised ambulatory care. Centres or clinics of health practitioners with the same degree or with different degrees from more than one speciality practising within the same establishment i.e., physician and dentist) are included in this item. Includes only government-funded community health facilities such as:

- Community centres and clinics;
- General practitioner plus centres;
- Multi-speciality community clinics.

Excludes clinical practices that provide exclusively medical services or exclusively health services, ambulatory mental health and substance abuse centres, and free-standing ambulatory surgical centres (reported under codes 108 to 114) and kidney dialysis centres and clinics (reported under codes 101 to 103 if part of a hospital or code 109 if they are free-standing ambulatory centres).

CODE 116 Blood and organ bank

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in collecting, storing and distributing blood and blood products and storing and distributing body organs.

CODE 117 Retail sale/supplier of medical goods – optical glasses and other vision products

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the retail sale of optical glasses and other vision products to the general public for personal or household consumption or utilisation. This includes the fitting and repair provided in combination with sales of optical glasses and other vision products.

Excludes organisations primarily engaged in providing optometric services.

CODE 118 Retail sale/supplier of medical goods – hearing aids

This item is not currently required to be reported by state and

territory health authorities.

Organisations primarily engaged in the sale of hearing aids to the general public for personal or household consumption or utilisation. This includes the fitting and repair provided in combination with the sale of hearing aids.

Excludes organisations primarily engaged in hearing testing where that also includes a component of hearing aid dispensing and fitting.

CODE 119 Retail sale/supplier of medical goods – dispensing community pharmacist

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the retail sale of pharmaceuticals to the general public for personal or household consumption or utilisation. Instances when the processing of medicine may be involved should be only incidental to selling. This includes both medicines with and without prescription.

Excludes organisations listed under code 201.

CODE 120 Retail sale/supplier of medical goods – other

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the sale of medical appliances other than optical goods and hearing aids to the general public with or without prescription for personal or household consumption or utilisation. Included are:

- Organisations primarily engaged in the manufacture of medical appliances but where the fitting and repair is usually done in combination with manufacture of medical appliances.
- Organisations engaged in the retail sale of other miscellaneous medical goods to the general public for personal or household consumption or utilisation (included are sales other than by shops, such as electronic shopping and mail-order houses).

Illustrative examples

- sale of fluids (e.g. for home dialysis);
- all other miscellaneous health and personal care stores;
- all other sale of pharmaceuticals and medical goods;
- electronic shopping and mail-order houses specialised in medical goods.

CODE 121 Provision and administration of public health program

Organisations engaged in government or private administration and provision of public health programs such as health promotion, organised screening, immunisation and health protection programs.

CODE 122 General health administration

Organisations primarily engaged in the regulation of activities of

agencies that provide health care, overall administration of health policy, and health insurance. This item comprises government administration (excluding social security) primarily engaged in the formulation and administration of government policy in health and in the setting and enforcement of standards for medical and paramedical personnel and for hospitals, clinics, etc., including the regulation and licensing of providers of health services. For example:

- Department of Health;
- Agencies for the regulation of safety in the workplace.

Excludes organisations primarily engaged in the provision and administration of public health programs which is reported under code 121.

CODE 123 Private health insurance provider

This item is not currently required to be reported by state and territory health authorities.

- Organisations engaged in insurance of health (other than social security funds and other social insurance funds) that provide insurance cover for hospital, medical, dental, pharmaceutical or funeral expenses. This includes organisations primarily engaged in activities involved in or closely related to the management of private health insurance (activities of insurance agents, average and loss adjusters and actuaries).

CODE 188 Main Health Care Service organisation - other

Organisations mainly engaged in providing health care services that are not reported under codes 101 to 123. Includes health or health-related call centres or e-health sites such as Poisons Information Centre and centres that provide information on alcohol and other drugs, mental health or other health issues.

CODE 198 Regional health service (not further defined)

Organisations at an area health service or regional level could be a combination of categories 101 to 188 but which could not be further disaggregated.

CODE 199 State/territory health authority (not further defined)

Organisations at the state or territory health authority level that could be a combination of categories 101 to 188 but which could not be further disaggregated.

Secondary/non-Health Care Service organisation

This item is not currently required to be reported by state and territory health authorities.

CODE 201 Pharmaceutical industry

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in wholesaling human pharmaceuticals, medicines, cosmetics, perfumes and toiletries. Also included are units mainly engaged in wholesaling veterinary drugs or medicines

Excludes organisations listed under code 119.

CODE 202 University

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in providing undergraduate or postgraduate teaching but which also undertake health research activities. Also includes organisations primarily engaged in undertaking research in the agricultural, biological, physical or social sciences. Units may undertake the research for themselves or others.

Includes:

- Postgraduate school, university operation
- Research school, university operation
- Specialist institute or college
- Undergraduate school, university operation
- University operation

For reporting purposes includes only the health or health related research component or other health services component of these organisations' activities.

CODE 203 Non-health related insurance

This item is not currently required to be reported by state and territory health authorities.

Units mainly engaged in providing general insurance cover (except life and health insurance).

Includes:

- Motor vehicle third party insurance provision
- Worker's compensation insurance provision

CODE 204 Residential aged care facility

This item is not currently required to be reported by state and territory health authorities.

An organisation comprised of one or more government-funded facilities primarily engaged in providing residential care to aged persons and in receipt of funding under the Aged Care Act and subject to Commonwealth reporting requirements (i.e. report to the System for the payment of Aged Residential Care (SPARC) collection.

Excludes facilities primarily providing services to persons requiring mental health diagnosis and treatment. Also excludes residential care facilities that report under the Commonwealth, State and Territory Disability Agreement where the primary purpose is care for persons with a disability.

CODE 288 Secondary/non-Health Care Service organisation – other

This item is not currently required to be reported by state and territory health authorities.

This item comprises organisations that are not reported under codes 201 to 203 which provide health care as secondary providers or other providers. Included are providers of

occupational health care and home care provided by private households.

Includes:

Occupational health care services not provided in separate health care organisations (all industries);

- Military health services not provided in separate health care organisations
- Prison health services not provided in separate health care organisations
- School health services
- Other providers n.e.c.

Other providers of services which support the health care industry such as laundry or catering services.

Other providers of services unrelated to the health care industry such as the building or automotive industry.

<i>Supplementary values:</i>																	

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Record a code sequentially for each health professional attended.</p> <p>A person may have attended several health professionals in the last 12 months; therefore more than one code can be recorded sequentially.</p> <p>Example 1: If a person has attended a diabetes educator and a podiatrist in the last twelve months, the code recorded would be 15.</p> <p>Example 2: If all have been seen, the code recorded would be 12345.</p> <p>If the person answers 'NO' to all the health professionals specified, code 8 should be applied.</p> <p>CODE 9 should only be used in situations where it is not practicable to ask the questions.</p>
-----------------------	---

Collection methods:

The person should be asked about each type of health professional in successive questions, as follows:

Have you attended any of the following health professionals in relation to diabetes mellitus in the last 12 months?

Diabetes educator Yes No

Dietician Yes No

Ophthalmologist Yes No

Optometrist Yes No

Podiatrist Yes No

The appropriate code should be recorded for each health professional attended.

Comments:

The health professional occupations are assigned the following codes at the occupation level of the Australian Standard Classification of Occupations, Second Edition, Australian Bureau of Statistics, 1997, Catalogue No. 1220.0

Diabetes educator 2512-13

Dietician 2393-11

Ophthalmologist 2312-19

Optometrist 2384-11

Podiatrist 2388-11

<i>Unit of measure:</i>	Centimetre (cm)				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>In order to ensure consistency in measurement, the measurement protocol described under Collection methods should be used.</p> <p>Measurements of height should be assessed in relation to children and adolescents' age and pubertal status.</p>
<i>Collection methods:</i>	<p>The measurement protocol described below are those recommended by the <i>International Society for the Advancement of Kinanthropometry as described by Norton et al. (1996), and the World Health Organization (WHO Expert Committee 1995), which was adapted from Lohman et al. (1988).</i></p> <p>Measurement protocol:</p> <p>Height measurements can be based on recumbent length or standing height. In general, length measurements are recommended for children under 2 years of age and height measurements for others.</p> <p>The measurement of height requires a vertical metric rule, a horizontal headboard, and a non-compressible flat even surface on which the subject stands. The equipment may be fixed or portable, and should be described and reported.</p> <p>The graduations on the metric rule should be at 0.1 cm intervals, and the metric rule should have the capacity to measure up to at least 210 cm.</p>

Measurement intervals and labels should be clearly readable under all conditions of use of the instrument.

Apparatus that allows height to be measured while the subject stands on a platform scale is not recommended.

Adults and children who can stand:

The subject should be measured without shoes (i.e. is barefoot or wears thin socks) and wears little clothing so that the positioning of the body can be seen. Anything that may affect or interfere with the measurement should be noted on the data collection form (e.g. hairstyles and accessories, or physical problems). The subject stands with weight distributed evenly on both feet, heels together, and the head positioned so that the line of vision is at right angles to the body. The correct position for the head is in the Frankfort horizontal plan (Norton et al. 1996). The arms hang freely by the sides. The head, back, buttocks and heels are positioned vertically so that the buttocks and the heels are in contact with the vertical board. To obtain a consistent measure, the subject is asked to inhale deeply and stretch to their fullest height. The measurer applies gentle upward pressure through the mastoid processes to maintain a fully erect position when the measurement is taken. Ensure that the head remains positioned so that the line of vision is at right angles to the body, and the heels remain in contact with the base board.

The movable headboard is brought onto the top of the head with sufficient pressure to compress the hair.

The measurement is recorded to the nearest 0.1 cm. Take a repeat measurement. If the two measurements disagree by more than 0.5 cm, then take a third measurement. All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject's measured height is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 cm. If so, rounding should be to the nearest even digit to reduce systematic over reporting (Armitage & Berry 1994). For example, a mean value of 172.25 cm would be rounded to 172.2 cm, while a mean value of 172.35 cm would be rounded to 172.4 cm.

Infants:

For the measurement of supine length of children up to and including 2 years of age, two observers are required. One observer positions the head correctly while the other ensures the remaining position is correct and brings the measuring board in contact with the feet. The subject lies in a supine position on a recumbent length table or measuring board. The crown of the head must touch the stationary, vertical headboard. The subject's head is held with the line of vision aligned perpendicular to the plane of the measuring surface. The shoulders and buttocks must be flat against the table top, with the shoulders and hips aligned

at right angles to the long axis of the body. The legs must be extended at the hips and knees and lie flat against the table top and the arms rest against the sides of the trunk. The measurer must ensure that the legs remain flat on the table and must shift the movable board against the heels. In infants care has to be taken to extend the legs gently. In some older children two observers may also be required.

In general, length or height is measured and reported to the nearest 0.1 cm. For any child, the length measurement is approximately 0.5 - 1.5 cm greater than the height measurement. It is therefore recommended that when a length measurement is applied to a height-based reference for children over 24 months of age (or over 85 cm if age is not known), 1.0 cm be subtracted before the length measurement is compared with the reference. It is also recommended that as a matter of procedure and data recording accuracy, the date be recorded when the change is made from supine to standing height measure.

Validation and quality control measures:

All equipment, whether fixed or portable should be checked prior to each measurement session to ensure that both the headboard and floor (or footboard) are at 90 degrees to the vertical rule. With some types of portable anthropometer it is necessary to check the correct alignment of the headboard, during each measurement, by means of a spirit level. Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within-) or different (between-) observers repeating the measurement of height, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement (Pederson & Gore 1996)) between observers should not exceed 5 mm and be less than 5 mm within observers.

Extreme values at the lower and upper end of the distribution of measured height should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference. Last digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

Comments:

This metadata item applies to persons of all ages. It is recommended for use in population surveys and health care settings.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present height data in categories. It is recommended that 5 cm groupings are used for this purpose. Height data should not be rounded before categorisation. The following categories may be appropriate for describing the heights of Australian men, women, children and adolescents although the range will depend on the population:

Height

70 cm = Height

75 cm = Height

... in 5 cm categories

185 cm = Height

Height => 190 cm

Collection and usage attributes

<i>Collection methods:</i>	<p>The method of data collection, e.g. face to face interview, telephone interview or self-completion questionnaire, can affect survey estimates and should be reported.</p> <p>The data collection form should include a question asking the respondent what their height is. For example, the Australian Bureau of Statistics National Health Survey 1995 included the question 'How tall are you without shoes?'. The data collection form should allow for both metric (to the nearest 1 cm) and imperial (to the nearest 0.5 inch) units to be recorded.</p> <p>If practical, it is preferable to enter the raw data into the database before conversion of measures in imperial units to metric. However if this is not possible, height reported in imperial units can be converted to metric prior to data entry using a conversion factor of 2.54 cm to the inch.</p> <p>Rounding to the nearest 1 cm will be required for measures converted to metric prior to data entry, and may be required for data reported in metric units to a greater level of precision than the nearest 1 cm. The following rounding conventions are desirable to reduce systematic over-reporting (Armitage & Berry 1994):</p>
----------------------------	--

NNN.x where x

NNN.x where $x > 5$ - round up, e.g. 172.7 cm would be rounded to 173 cm.

NNN.x where $x = 5$ - round to the nearest even number, e.g. 172.5 cm would be rounded to 172 cm, while 173.5 cm would be rounded to 174 cm.

Comments:

This metadata item is recommended for persons aged 18 years or older. It is recommended for use in population surveys when it is not possible to measure height.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present height data in categories. It is recommended that 5 cm groupings are used for this purpose. Height data should not be rounded before categorisation. The following categories may be appropriate for describing the heights of Australian men and women, although the range will depend on the population. The World Health Organization's range for height is 140-190 cm.

Height <140 cm

140 cm = Height < 145 cm

145 cm = Height < 150 cm

... in 5 cm categories

185 cm = Height < 190 cm

Height => 190 cm

On average, height tends to be overestimated when self-reported by respondents. Data for Australian men and women aged 20-69 years in 1989 indicated that men overestimated by an average of 1.1 cm (SEM* of 0.04 cm) and women by an average of 0.5 cm (SEM of 0.05 cm) (Waters 1993). The extent of overestimation varied with age.

*Note: SEM is the standard error of measurement.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	As there are no cut-off points for waist-to-hip ratio for children and adolescents, it is not necessary to collect this metadata item for those aged under 18 years.
<i>Collection methods:</i>	<p>The measurement protocol described below is that recommended by the <i>World Health Organization (WHO Expert Committee 1995)</i>.</p> <p>Measurement protocol:</p> <p>The data collection form should allow for up to three measurements of hip circumference to be recorded in centimetres to 1 decimal place. The data collection form should also have the capacity to record any reasons for the non-collection of hip circumference data.</p> <p>The measurement of hip circumference requires a narrow (</p> <p>The subject should wear only non-restrictive briefs or underwear, a light smock over underwear or light clothing. Belts and heavy outer clothing should be removed. Hip measurement should be taken over one layer of light clothing only.</p> <p>The subject stands erect with arms at the sides, feet together and the gluteal muscles relaxed. The measurer sits at the side of the subject so that the level of maximum posterior extension of the</p>

buttocks can be seen. An inelastic tape is placed around the buttocks in a horizontal plane. To ensure contiguity of the two parts of the tape from which the circumference is to be determined, the cross-handed technique of measurement, as described by Norton et al. (1996), should be used. Ideally an assistant will check the position of the tape on the opposite side of the subject's body. The tape is in contact with the skin but does not compress the soft tissues. Fatty aprons should be excluded from the hip circumference measurement.

The measurement is recorded to the nearest 0.1 cm. Take a repeat measurement and record it to the nearest 0.1 cm. If the two measurements disagree by more than 1 cm, then take a third measurement.

All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject's measured hip circumference is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 cm. If so, rounding should be to the nearest even digit to reduce systematic over reporting. For example, a mean value of 102.25 cm would be rounded to 102.2 cm, while a mean value of 102.35 cm would be rounded to 102.4 cm.

Validation and quality control measures:

Steel tapes should be checked against a 1-metre engineer's rule every 12 months. If tapes other than steel are used they should be checked daily against a steel rule.

Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within-) or different (between-) observers repeating the measurement, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement (Pederson & Gore 1996)) between observers should not exceed 2% and be less than 1.5% within observers.

Extreme values at the lower and upper end of the distribution of measured hip circumference should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference.

Last digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

This metadata item applies to persons aged 18 years or older. It is recommended for use in population surveys and health care settings.

Its main use is to enable the calculation of adult waist-to-hip ratio which requires the measurement of hip circumference and waist circumference.

Comments:

More recently it has emerged that waist circumference alone, or in combination with other metabolic measures, is a better indicator of risk and reduces the errors in waist-to-hip ratio measurements.

Waist-to-hip ratio is therefore no longer a commonly used measure.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present hip circumference data in categories. It is recommended that 5 cm groupings be used for this purpose. Hip circumference data should not be rounded before categorisation.

Collection and usage attributes

<i>Guide for use:</i>	<p>Only one code can be recorded.</p> <p>When more than one grade is documented for the primary tumour within the same specimen report, use the highest grade. For example, if grade 2-3 is documented, record the grade as 3.</p> <p>If the grades differ on multiple pathology reports for the same</p>
-----------------------	---

tumour, use the value from the larger specimen (for example, the grade from a surgical excision specimen would be used over the grade from a specimen from a diagnostic biopsy).

Breast cancer coding rules:

Use the Nottingham grade (Elston-Ellis modification of Bloom-Richardson grading system). This classification only uses grades 1-3, 9.

For an invasive tumour with an in situ component, record the grade for the invasive component only. If the grade of the invasive component is not reported, record the grade as unknown.

Collection methods:

Cancer registry use:

Collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease.

Collection and usage attributes

<i>Guide for use:</i>	<p>Persons covered by insurance for benefits of ancillary services only are included in 2 - no hospital insurance.</p> <p>The 'unknown' category should not be used in primary collections but can be used to record unknown insurance status in databases.</p> <p>This metadata item is to determine whether the patient has hospital insurance, not their method of payment for the episode of care.</p>
<i>Comments:</i>	<p>Insurance status was reviewed and modified to reflect changes to new private health insurance arrangements under the Health Legislation (Private Health Insurance Reform) Amendment Act 1995.</p>

Employee health benefits schemes became illegal with the implementation of Schedule 2 of the private health insurance reforms, effective on 1 October 1995.

Under Schedule 4 of the private health insurance reforms, on 1 July 1997, the definition of the 'basic private table' or 'basic table', and 'supplementary hospital table' and any references to these definitions was omitted from the National Health Act 1953. All hospital tables offered by registered private health insurers since 29 May 1995 have been referred to as 'Applicable Benefits Arrangements' and marketed under the insurer's own product name.

-----------------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	This metadata item relates to each position (job) held by a medical practitioner.
<i>Collection methods:</i>	There are inherent problems in asking for information on number of hours on-call not worked per week, for example, reaching a satisfactory definition and communicating this definition to the respondents in a self-administered survey. Whether hours on-call not worked are collected for main job only, or main job and one or more additional jobs, it is important that a total for all jobs is included.

Human epidermal growth factor receptor-2 test result

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person with cancer – human epidermal growth factor receptor-2 test result, code N
<i>Synonymous names:</i>	HER2 test result
<i>METeOR identifier:</i>	370572
<i>Registration status:</i>	Health, Standard 06/03/2009
<i>Definition:</i>	The result of a person's human epidermal growth factor receptor-2 (HER2) test, as represented by a code.
Data Element Concept:	Person with cancer – human epidermal growth factor receptor-2 test result

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code								
<i>Data type:</i>	Number								
<i>Format:</i>	N								
<i>Maximum character length:</i>	1								
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Positive</td></tr><tr><td>2</td><td>Negative</td></tr><tr><td>3</td><td>Equivocal</td></tr></tbody></table>	Value	Meaning	1	Positive	2	Negative	3	Equivocal
Value	Meaning								
1	Positive								
2	Negative								
3	Equivocal								
<i>Supplementary values:</i>	<table><tbody><tr><td>7</td><td>Unknown (test results not available)</td></tr><tr><td>8</td><td>Not applicable (test not done)</td></tr></tbody></table>	7	Unknown (test results not available)	8	Not applicable (test not done)				
7	Unknown (test results not available)								
8	Not applicable (test not done)								

Collection and usage attributes

<i>Guide for use:</i>	<p>Record the reported conclusion of the HER2.</p> <p>If no conclusion is reported use the following guidelines (from the National Breast and Ovarian Cancer Centre and Australian Cancer Network's pathology reporting guide (3rd ed.) for breast cancer):</p> <p>CODE 1 Positive</p> <ul style="list-style-type: none">• For in situ hybridisation: Result is more than 6 copies of the HER2 gene per nucleus OR a ratio of HER2 gene signals to chromosome 17 signals of more than 2.2.• For Immunocytochemistry: Result is described as 3+ or +++ OR >30% of cancer cells show strong complete membrane staining without cytoplasmic staining and without staining of normal tissue. <p>CODE 2 Negative</p>
-----------------------	---

- **For in situ hybridisation:**
Result is less than 4 copies of the HER2 gene per nucleus OR a ratio of HER2 gene signals to chromosome 17 signals of less than 1.8.
- **For Immunocytochemistry:**
Result described as 0, 1+ or + OR <10% of cancer cells show staining.

CODE 3 Equivocal

- **For in situ hybridisation:**
Result is an average of between 4 and 6 HER2 gene copies per nucleus with a single probe OR a ratio of HER2 gene signals to chromosome 17 signals in the range of 1.8-2.2.
- **For Immunocytochemistry:**
Result described as 2+ or ++ OR <10% of cancer cells show strong complete membrane staining (rare) OR 10-30% of cancer cells show weak to moderate complete membrane staining OR Strong cytoplasmic staining is present, making assessment of membrane staining difficult.

Supplementary codes

CODE 7 Unknown (test results not available)

Use this code when the test has been performed but the results are not yet available for analysis.

CODE 8 Not applicable (test not done)

This code is used as a validation measure, to show that the reason for the lack of results is due to the test not being performed.

Data element attributes

Collection and usage attributes

Collection methods:

For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or subsequent metastatic disease.

Where different values are available from multiple specimens, the appropriate values to enter are selected according to the following hierarchy of rules:

When multiple HER2 values are available, the value established by the most accurate test is used as per the hierarchy: FISH > CISH/SISH > IHC. (See Person with cancer – HER2 test type, code N) If the HER2 values differ on multiple pathology reports for the same tumour, use the value from the larger specimen.

For multifocal tumours, use the HER2 value from the largest focus or from a metastatic deposit; e.g. Lymph node metastasis. A smaller focus that is HER2 positive may in fact be the source of a metastasis and in this setting the patient would derive benefit from the therapy offered as a result of HER2 positive status.

Comments:

Human epidermal growth factor receptor-2 (HER2) promotes the growth of cancer cells. HER2 is also known as c-erbB-2 and Her2/neu. Tumours that are HER2-positive tend to grow more quickly than other types of cancer. HER2 status is an important prognostic marker and predicts the response to several therapies.

Human epidermal growth factor receptor-2 test type

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person with cancer – human epidermal growth factor receptor-2 test type, code N
<i>Synonymous names:</i>	HER2 test type
<i>METeOR identifier:</i>	370607
<i>Registration status:</i>	Health, Standard 06/03/2009
<i>Definition:</i>	The type of test used to determine the results of human epidermal growth factor receptor-2 (HER2) at the time of diagnosis of the primary tumour, as represented by a code.
Data Element Concept:	Person with cancer – human epidermal growth factor receptor-2 test type

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code												
<i>Data type:</i>	Number												
<i>Format:</i>	N												
<i>Maximum character length:</i>	1

<i>Supplementary values:</i>													

Collection and usage attributes

<i>Guide for use:</i>	CODE 2 Brightfield in situ hybridisation Includes Chromogenic in situ hybridisation (CISH) and Silver in situ hybridisation (SISH).
-----------------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Record the test type corresponding to the test result recorded in 'Person with Cancer - human epidermal growth factor receptor-2 test result'.
<i>Comments:</i>	Immunochemistry (IHC) measures how much HER2 protein is present in the tumour sample. Fluorescence in situ hybridisation (FISH), chromogenic in situ hybridisation (CISH) and silver in situ hybridisation (SISH) measure the amount of amplification of the gene responsible for HER2. The type of HER2 test used to determine HER2 status affects the accuracy of the information.

Data element attributes

Collection and usage attributes

Guide for use:

This coding is to be used in conjunction with specified Body Functions domains. For example, 'a mild impairment of functions related to the brain' to indicate the area of impairment and, potentially, the sorts of interventions that may result in improved functioning. The body function in which an individual experiences an impairment is indicated using the metadata item Person – body function, code (ICF 2001) AN[NNNN].

	14	Total knee replacement
	15	Varicose veins stripping and ligation
<i>Supplementary values:</i>	16	Not applicable

Data element attributes

Collection and usage attributes

Guide for use:

The procedure terms are defined by the Australian Classification of Health Interventions (ACHI) codes which are listed in comments below. Where a patient is awaiting more than one indicator procedure, all codes should be listed. This is because the intention is to count procedures rather than patients in this instance.

These are planned procedures for the waiting list, not what is actually performed during hospitalisation.

Comments:

The list of indicator procedures may be reviewed from time to time. Some health authorities already code a larger number of waiting list procedures.

Waiting list statistics for indicator procedures give a specific indication of performance in particular areas of elective care provision. It is not always possible to code all elective surgery procedures at the time of addition to the waiting list. Reasons for this include that the surgeon may be uncertain of the exact procedure to be performed, and that the large number of procedures possible and lack of consistent nomenclature would make coding errors likely. Furthermore, the increase in workload for clerical staff may not be acceptable. However, a relatively small number of procedures account for the bulk of the elective surgery workload. Therefore, a list of common procedures with a tendency to long waiting times is useful. Waiting time statistics by procedure are useful to patients and referring doctors. In addition, waiting time data by procedure assists in planning and resource allocation, audit and performance monitoring.

The following is a list of ACHI (5th edition) codes, for the indicator procedures:

Cataract extraction:

42698-00 [195] 42702-00 [195] 42702-01 [195] 42698-01 [196] 42702-02 [196]

Collection and usage attributes

Guide for use: This metadata item is based on the Australian Bureau of Statistics (ABS) standard for Indigenous status. For detailed advice on its use and application please refer to the ABS Website as indicated in the Reference documents.

The classification for Indigenous status has a hierarchical structure comprising two levels. There are four categories at the detailed level of the classification which are grouped into two categories at the broad level. There is one supplementary category for 'not stated' responses. The classification is as follows:

Indigenous:

- Aboriginal but not Torres Strait Islander origin.
- Torres Strait Islander but not Aboriginal origin.
- Both Aboriginal and Torres Strait Islander origin.

Non-Indigenous:

- Neither Aboriginal nor Torres Strait Islander origin.

Not stated/ inadequately described:

This category is not to be available as a valid answer to the questions but is intended for use:

- Primarily when importing data from other data collections that do not contain mappable data.
- Where an answer was refused.
- Where the question was not able to be asked prior to completion of assistance because the client was unable to communicate or a person who knows the client was not available.

Only in the last two situations may the tick boxes on the questionnaire be left blank.

Data element attributes

Collection and usage attributes

Collection methods:

The standard question for Indigenous Status is as follows:

[Are you] [Is the person] [Is (name)] of Aboriginal or Torres Strait Islander origin?

(For persons of both Aboriginal and Torres Strait Islander origin, mark both 'Yes' boxes.)

No.....

Yes, Aboriginal.....

Yes, Torres Strait Islander.....

This question is recommended for self-enumerated or interview-based collections. It can also be used in circumstances where a close relative, friend, or another member of the household is answering on behalf of the subject. It is strongly recommended that this question be asked directly wherever possible.

When someone is not present, the person answering for them should be in a position to do so, i.e. this person must know well the person about whom the question is being asked and feel confident to provide accurate information about them.

This question must always be asked regardless of data collectors' perceptions based on appearance or other factors.

The Indigenous status question allows for more than one response. The procedure for coding multiple responses is as follows:

If the respondent marks 'No' and either 'Aboriginal' or 'Torres Strait Islander', then the response should be coded to either Aboriginal or Torres Strait Islander as indicated (i.e. disregard the 'No' response).

If the respondent marks both the 'Aboriginal' and 'Torres Strait Islander' boxes, then their response should be coded to 'Both Aboriginal and Torres Strait Islander Origin'.

If the respondent marks all three boxes ('No', 'Aboriginal' and 'Torres Strait Islander'), then the response should be coded to 'Both Aboriginal and Torres Strait Islander Origin' (i.e. disregard the 'No' response).

This approach may be problematical in some data collections, for example when data are collected by interview or using screen based data capture systems. An additional response category Yes, both Aboriginal and Torres Strait Islander...

may be included if this better suits the data collection practices of the agency or establishment concerned.

Comments:

The following definition, commonly known as 'The Commonwealth Definition', was given in a High Court judgement in the case of *Commonwealth v Tasmania* (1983) 46 ALR 625.

'An Aboriginal or Torres Strait Islander is a person of Aboriginal or Torres Strait Islander descent who identifies as an Aboriginal or Torres Strait Islander and is accepted as such by the community in which he or she lives'.

There are three components to the Commonwealth definition:

- descent;
- self-identification; and
- community acceptance.

In practice, it is not feasible to collect information on the community acceptance part of this definition in general purpose statistical and administrative collections and therefore standard questions on Indigenous status relate to descent and self-identification only.

Individual sessions (public psychiatric, alcohol and drug hospital)—emergency and outpatient

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Establishment (public psychiatric or alcohol and drug hospital) – number of individual session occasions of service for non-admitted patients (emergency and outpatient), total N[NNNNNN]
<i>Synonymous names:</i>	Type of non-admitted patient care (public psychiatric, alcohol & drug) - emergency and outpatient individual sessions
<i>METeOR identifier:</i>	270216
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The total number of occasions of examination, consultation, treatment or other services provided as individual sessions to non-admitted patients in the emergency and outpatient functional unit of a public psychiatric or alcohol and drug hospital.
Data Element Concept:	Establishment – number of individual session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NNNNNN]
<i>Maximum character length:</i>	7
<i>Unit of measure:</i>	Occasion of service

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Emergency patients and outpatients are persons who receive non-admitted care. Individual non-admitted care is care provided to a person who receives direct care within the emergency department or other designated clinics within the hospital and who is not formally admitted at the time when the care is provided. A person who first contacts the hospital and receives non-admitted care, for example through the emergency department, and is subsequently admitted should have both components of care enumerated separately.
<i>Comments:</i>	A group is defined as two or more patients receiving a service together where all individuals are not members of the same family. Family services are to be treated as occasions of service to an individual.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>For occasions of service as individual sessions to non-admitted patients attending designated drug and alcohol units within hospitals.</p> <p>This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.</p> <p>A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p> <p>The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or</p>
-----------------------	--

departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Each diagnostic test or simultaneous set of related diagnostic tests for the one patient referred to a hospital pathology department consists of one occasion of service.

-----------------------	---

admitted should be identified as a subset of the total occasions of service.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients.

This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary. For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

<i>Guide for use:</i>	<p>For all occasions of endoscopy and related procedures provided as individual sessions to non-admitted patients.</p> <p>Endoscopy and related procedures include:</p> <ul style="list-style-type: none">• cystoscopy• gastroscopy• oesophagoscopy• duodenoscopy• colonoscopy• bronchoscopy• laryngoscopy. <p>Where one of these procedures is carried out in a ward or clinic classified elsewhere, for example in the emergency department, the occasion is to be included under endoscopy and related procedures, and to be excluded from the other category. Care</p>
-----------------------	--

must be taken to ensure procedures for admitted patients are excluded from this category.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients.

This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary. For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.</p>
-----------------------	--

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

	+8	Facilitator not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.
-----------------------	--

Extent of influence of environmental factors corresponds to the degree, strength or magnitude of the influence and the amount of time the influence is experienced by the person. It is essentially a summary measure, in which are embedded the concepts of availability, quality and importance, that indicates the effect the specified environmental factor has on the person.

Whether, and by how much, environmental factors are influencing an individual's level of functioning, and whether the influence is a facilitator or barrier, may indicate the sorts of interventions that will optimise the individual's functioning. This information may be for policy development, service provision, or advocacy purposes. Preventative strategies could be indicated by this information.

This value domain can be used to collect information across the whole spectrum of influence, for example, tactile flooring may be a facilitator to a person with visual impairment and a barrier to a person with mobility impairments. In line with the ICF approach to functioning and disability, this value domain recognises, and gives the means to record, the positive influence of environmental factors as well as those factors that limit the level of functioning of a person.

The codes are mutually exclusive. The choice of codes depends on the context of the data collection. For example; if collecting information about the positive influence of an environmental factor such as a community service it would be appropriate to use Code 0 No facilitator if the service was not influencing the person's level of functioning (even if the service were not a barrier to the person's functioning).

Code +0 No facilitator:

Used when the environment factor does not impact in a positive way on the body structure or function, activity or participation of a person.

Code +1 Mild facilitator:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 5-24% of the time the person participates in the specified domain of functioning or has a low level of impact on the person's functioning.

Code +2 Moderate facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 25-49% of the time the person participates in the specified domain of functioning or has a significant, but moderate impact on the person's functioning.

Code +3 Substantial facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 50-95% of the time the person participates in the specified domain of functioning or has an extreme effect on the person's functioning.

Code +4 Complete facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 96-100% of the time the person participates in the specified domain of functioning or the person functions optimally with this environmental factor.

Code +8 Facilitator not specified:

Used when there is insufficient information to record the Extent of environmental influence code (ICF 2001) N in classes +1 to +4.

Code 0 No barrier:

Used when the environment factor does not impact in a negative way on the body structure or function, activity or participation of a person.

Code 1 Mild barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 5-24% of the time the person participates in the specified domain of functioning or has a low level of impact on the person's functioning.

Code 2 Moderate barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 25-49% of the time the person participates in that specified domain of functioning or has a significant, but moderate impact on the person's functioning.

Code 3 Severe barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 50-95% of the time the person participates in that specified domain of functioning or has an extreme effect on the person's functioning.

Code 4 Complete barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 96-100% of the time the person participates in the specified domain of functioning or is of such magnitude that the person is unable to function.

Code 8 Barrier not specified:

Used when there is insufficient information to record the Extent of environmental influence code (ICF 2001) N in classes 1 to 4.

Code 9 Not applicable:

Used when environmental factors impacts in neither a positive or negative way on the body structure or function, activity or participation of a person or for between 0-4% of the time the person participates in that specified area and has minimal impact on the person's level of functioning in the specified domain.

<i>Guide for use:</i>	CODE 9 Not stated/inadequately described This code is not for use in primary data collections.
-----------------------	---

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Informal carers may include those people who receive a pension or benefit for their caring role and people providing care under family care agreements. Excluded from the definition of informal carers are volunteers organised by formal services and paid workers.</p> <p>This metadata item is purely descriptive of a client's circumstances. It is not intended to reflect whether the informal carer is considered by the service provider to be capable of undertaking the caring role. The expressed views of the client and/or their carer should be used as the basis for determining whether the client is recorded as having an informal carer or not.</p> <p>When asking a client whether they have an informal carer, it is</p>
-----------------------	---

important for agencies or establishments to recognise that a carer does not always live with the person for whom they care. That is, a person providing significant care and assistance to the client does not have to live with the client in order to be called an informal carer.

Collection methods:

Agencies or establishments and service providers may collect this item at the beginning of each service episode and /or assess this information at subsequent assessments.

Some agencies, establishments/providers may record this information historically so that they can track changes over time. Historical recording refers to the practice of maintaining a record of changes over time where each change is accompanied by the appropriate date.

Examples of questions that have been used for data collection include:

Home and Community Care NMDS

'Do you have someone who helps look after you?'

Commonwealth State/Territory Disability Agreement NMDS

*'Does the service user have an informal carer, such as **family** member, friend or neighbour, who provides care and assistance on a regular and sustained basis?'*

Comments:

Recent years have witnessed a growing recognition of the critical role that informal support networks play in caring for frail older people and people with disabilities within the community. Not only are informal carers responsible for maintaining people with often high levels of functional dependence within the community, but the absence of an informal carer is a significant risk factor contributing to institutionalisation. Increasing interest in the needs of carers and the role they play has prompted greater interest in collecting more reliable and detailed information about carers and the relationship between informal care and the provision of and need for formal services.

This definition of informal carer is not the same as the Australian Bureau of Statistics (ABS) definition of principal carer, 2003 Survey of Disability, Ageing and Carers and primary carer used in the 1998 survey. The ABS definitions require that the carer has or will provide care for a certain amount of time and that they provide certain types of care.

The ABS defines a primary carer as a person of any age who provides the most informal assistance, in terms of help or supervision, to a person with one or more disabilities. The assistance has to be ongoing, or likely to be ongoing, for at least six months and be provided for one or more of the core activities (communication, mobility and self care). This may not be appropriate for community services agencies wishing to obtain information about a person's carer regardless of the amount of time that care is for, or the types of care provided.

Information such as the amount of time for which care is provided can of course be collected separately but, if it were not needed, it would place a burden on service providers.

Collection and usage attributes

<i>Comments:</i>	The development of a definition of a birth centre is currently under consideration by the Commonwealth in conjunction with the states and territories.
------------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Code 1 Hospital, excluding birth centre Hospital, excluding birth centre, includes for women who have elective caesarean sections
	Code 4 Home Home, should be restricted to the home of the woman or a relative or friend.
	Code 8 Other Other, includes community (health) centres.

Comments: Women who plan to give birth in birth centres or at home usually have different risk factors for outcome compared to those who plan to give birth in hospitals. Women who are transferred to hospital after the onset of labour have increased risks of intervention and adverse outcomes.

Inter-hospital contracted patient

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of admitted patient care – inter-hospital contracted patient status, code N
<i>METeOR identifier:</i>	270409
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	An episode of care for an admitted patient whose treatment and/or care is provided under an arrangement between a hospital purchaser of hospital care (contracting hospital) and a provider of an admitted service (contracted hospital), and for which the activity is recorded by both hospitals, as represented by a code.
Data Element Concept:	Episode of admitted patient care – inter-hospital contracted patient status

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code										
<i>Data type:</i>	Number										
<i>Format:</i>	N										
<i>Maximum character length:</i>	1										
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Inter-hospital contracted patient from public sector hospital</td></tr><tr><td>2</td><td>Inter-hospital contracted patient from private sector hospital</td></tr><tr><td>3</td><td>Not contracted</td></tr><tr><td>9</td><td>Not reported</td></tr></tbody></table>	Value	Meaning	1	Inter-hospital contracted patient from public sector hospital	2	Inter-hospital contracted patient from private sector hospital	3	Not contracted	9	Not reported
Value	Meaning										
1	Inter-hospital contracted patient from public sector hospital										
2	Inter-hospital contracted patient from private sector hospital										
3	Not contracted										
9	Not reported										
<i>Supplementary values:</i>											

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A specific arrangement should apply (either written or verbal) whereby one hospital contracts with another hospital for the provision of specific services. The arrangement may be between any combination of hospital; for example, public to public, public to private, private to private, or private to public.</p> <p>This data element item will be derived as follows.</p> <p>If Contract role = B (Hospital B, that is, the provider of the hospital service; contracted hospital), and Contract type = 2, 3, 4 or 5 (that is, a hospital (Hospital A) purchases the activity, rather than a health authority or other external purchaser, and admits the patient for all or part of the episode of care, and/or records</p>
-----------------------	---

the contracted activity within the patient's record for the episode of care). Then record a value of 1, if Hospital A is a public hospital or record a value of 2, if Hospital A is a private hospital. Otherwise if the Contract role is not B, and/or the Contract type is not 2, 3, 4 or 5 record a value of 3.

Collection methods:

All services provided at both the originating and destination hospitals should be recorded and reported by the originating hospital. The destination hospital should record the admission as an 'Inter-hospital contracted patient' so that these services can be identified in the various statistics produced about hospital activity.

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 Employed:</p> <p>Persons aged 15 years and over who, during the reference week:</p> <p>(a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising 'Employees', 'Employers' and 'Own Account Workers'); or</p> <p>(b) worked for one hour or more without pay in a family business or on a farm (i.e. 'Contributing Family Worker'); or</p> <p>(c) were 'Employees' who had a job but were not at work and were:</p> <ul style="list-style-type: none">• on paid leave• on leave without pay, for less than four weeks, up to the end of the reference week• stood down without pay because of bad weather or plant breakdown at their place of employment, for less than four weeks up to the end of the reference week• on strike or locked out
-----------------------	--

- on workers' compensation and expected to be returning to their job, or
- receiving wages or salary while undertaking full-time study; or

(d) were 'Employers', 'Own Account Workers' or 'Contributing Family Workers' who had a job, business or farm, but were not at work.

CODE 2 Unemployed:

Unemployed persons are those aged 15 years and over who were not employed during the reference week, and:

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week. Were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week). Or were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or

(b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown. Note: Actively looking for work includes writing, telephoning or applying in person to an employer for work. It also includes answering a newspaper advertisement for a job, checking factory or job placement agency notice boards, being registered with a job placement agency, checking or registering with any other employment agency, advertising or tendering for work or contacting friends or relatives.

CODE 3 Not in the Labour Force:

Persons not in the labour force are those persons aged 15 years and over who, during the reference week, were not in the categories employed or unemployed, as defined. They include persons who were keeping house (unpaid), retired, voluntarily inactive, permanently unable to work, persons in institutions (hospitals, gaols, sanatoriums, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the reference week was jury service or unpaid voluntary work for a charitable organisation.

	U	Unknown

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The valid International Classification of Diseases for Oncology values for the variable are provided in the list below: Right Origin of primary site is on the right side of a paired organ. Left Origin of primary site is on the left side of a paired organ. Paired organs are: Breast (C50), Lung (C34), Kidney (C64), Ovary (C56), Eyes (C69), Arms (C76.4, C44.6, C49.1, C47.1, C40.0, C77.3,), Legs (C76.5, C44.7, C49.2, C47.2, C40.2, C77.4), Ears (C44.2, C49.0, C30.1), Testicles (C62), Parathyroid glands (C75.0), Adrenal glands (C74.9, C74.0, C74.1), Tonsils (C09.9, C02.4, C11.1, C09.0, C09.1, C03.9), Ureter (C66.9), Carotid body (C75.4), Vas deferens (C63.1), Optic nerve (C72.3) Bilateral Includes organs that are bilateral as a single primary (e.g. bilateral retinoblastoma (M9510/3, C69.2), (M9511/3, C69.2),
-----------------------	--

(M9512/3, C69.2), (C69.6, C48.0), bilateral Wilms tumours (C64.9, M8960/3) Note: Bilateral cancers are very rare.

Unknown

It is unknown whether, for a paired organ the origin of the cancer was on the left or right side of the body.

Collection methods:

This information should be obtained from the patient's pathology report, the patient's medical record, or the patient's medical practitioner/nursing staff.

----------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 Primary palliative care</p> <p>Capability: Clinical management and care coordination including assessment, triage, and referral using a palliative approach for patients with uncomplicated needs associated with a life limiting illness and/or end of life care. Has formal links with a specialist palliative care provider for purposes of referral, consultation and access to specialist care as necessary.</p> <p>Typical resource profile: General medical practitioner, nurse practitioner, registered nurse, generalist community nurse, aboriginal health worker, allied health staff. Specialist health care providers in other disciplines would be included at this level.</p>
-----------------------	--

CODE 2 Specialist palliative care level 1

Capability: Provides palliative care for patients, primary carers and families whose needs exceed the capability of primary palliative care providers. Provides assessment and care consistent with needs and provides consultative support, information and advice to primary palliative care providers. Has formal links to primary palliative care providers and level 2 and/or 3 specialist palliative care providers to meet the needs of patients, carers and families with complex problems. Has quality and audit program.

Typical resource profile: Multi-disciplinary team including medical practitioner with skills and experience in palliative care, clinical nurse specialist/consultant, allied health staff, pastoral care and volunteers. A designated staff member if available, coordinates a volunteer service.

CODE 3 Specialist palliative care level 2

Capability: As for level 1, able to support higher resource level due to population base (e.g. regional area). Provides formal education programs to primary palliative care and level 1 providers and the community. Has formal links with primary palliative care providers and level 3 specialist palliative care services for patients, primary carers and families with complex needs.

Typical resource profile: Interdisciplinary team including medical practitioner and clinical nurse specialist/consultant with specialist qualifications. Includes designated allied health and pastoral care staff.

CODE 4 Specialist palliative care level 3

Capability: Provides comprehensive care for the needs of patients, primary carers and families with complex needs. Provides local support to primary palliative care providers, regional level 1 and/or 2 services including education and formation of standards. Has a comprehensive research and teaching role. Has formal links with local primary palliative care providers and with specialist palliative care providers level 1 and 2, and relevant academic units including professorial chairs where available.

Typical resource profile: Interdisciplinary team including a medical director and clinical nurse consultant/nurse practitioner and allied health staff with specialist qualifications in palliative care.

Living arrangement

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – living arrangement, health sector code N
<i>METeOR identifier:</i>	299712
<i>Registration status:</i>	Health, Standard 14/06/2005
<i>Definition:</i>	Whether a person usually resides alone or with others, as represented by a code.
<i>Context:</i>	Client support needs and clinical setting.
<i>Data Element Concept:</i>	Person – living arrangement

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code								
<i>Data type:</i>	Number								
<i>Format:</i>	N								
<i>Maximum character length:</i>	1								
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Lives alone</td></tr><tr><td>2</td><td>Lives with others</td></tr><tr><td>9</td><td>Not stated/inadequately described</td></tr></tbody></table>	Value	Meaning	1	Lives alone	2	Lives with others	9	Not stated/inadequately described
Value	Meaning								
1	Lives alone								
2	Lives with others								
9	Not stated/inadequately described								
<i>Supplementary values:</i>									

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	This item does not seek to describe the quality of the arrangements but merely the fact of the arrangement. It is recognised that this item may change on a number of occasions during the course of an episode of care.
<i>Comments:</i>	<p>Whether or not a person lives alone is a significant determinant of risk.</p> <p>Living alone may preclude certain treatment approaches (e.g. home dialysis for end-stage renal disease). Social isolation has also been shown to have a negative impact on prognosis in males with known coronary artery disease with several studies suggesting increased mortality rates in those living alone or with no confidant.</p>

Location of impairment

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person—location of impairment of body structure, code (ICF 2001) N
<i>METeOR identifier:</i>	320177
<i>Registration status:</i>	Health, Standard 29/11/2006 Community services, Standard 16/10/2006
<i>Definition:</i>	The location of a person's impairment in a specified body structure, as represented by a code.
<i>Context:</i>	Human functioning and disability
Data Element Concept:	Person—location of impairment of body structure

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Functioning, Disability and Health 2001	
<i>Representation class:</i>	Code	
<i>Data type:</i>	Number	
<i>Format:</i>	N	
<i>Maximum character length:</i>	1	
<i>Permissible values:</i>	Value	Meaning
	0	More than one region
	1	Right
	2	Left
	3	Both sides
	4	Front
	5	Back
	6	Proximal
	7	Distal
<i>Supplementary values:</i>	8	Not specified
	9	Not applicable

Collection and usage attributes

<i>Guide for use:</i>	<p>This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.</p> <p><i>Impairments of body structure</i> are problems in body structure such as a loss or significant departure from population standards or averages.</p> <p>Use only one code. Select the one that best describes the situation with this structure. Combinations are not possible.</p>
-----------------------	---

CODE 0 More than one region (except both sides)

Used when the impairment is present in more than one body location (but not bilaterally see code 3); for example when burn scars affect many areas of skin.

CODE 1 Right

Used when the impairment is present to the right of the midline of the person's body.

CODE 2 Left

Used when the impairment is present to the left of the midline of the person's body.

CODE 3 Both sides (bilateral)

Used when the impairment is two-sided and disposed on opposite sides of the midline axis of the body, for example bilateral joint deformities.

CODE 4 Front

Used when the impairment is present in front of a line passing through the midline of the body when viewed from the side.

CODE 5 Back

Used when the impairment is present behind a line passing through the midline of the body when viewed from the side.

CODE 6 Proximal

Used when the impairment is situated towards the point of origin or attachment, as of a limb or bone (opposed to distal), for example the end of the structure that is closer to the centre of the body.

CODE 7 Distal

Used when the impairment is situated away from the point of origin or attachment, as of a limb or bone (opposed to proximal), for example the end of structure that is further away from the centre of the body.

CODE 8 Not specified

Used when there is an impairment of body structure but the location of the impairment is not recorded.

CODE 9 Not applicable

Used when it is not appropriate to code the location of an impairment of body structure.

Value	Meaning										
1	Present										
2	Absent										
3	Suspicious										
9	Not stated or unknown										
<i>Supplementary values:</i>											

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The presence of lymphovascular invasion should be recorded as Code 1, regardless of whether the extent of the invasion is described or not.
<i>Collection methods:</i>	For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease. If pathology report pertaining to initial diagnosis is for a metastasis, and not the primary tumour, record as 9.
<i>Comments:</i>	Invasion of the lymphatics or blood vessels by cancer cells is an important prognostic factor that indicates that the tumour is likely to spread. This item is included in data items defined for reporting in the pathology reporting guidelines as prepared by the National Breast and Ovarian Cancer Centre and Australian Cancer Network.

Main language other than English spoken at home

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – main language other than English spoken at home, code (ASCL 2005) NN{NN}
<i>METeOR identifier:</i>	304133
<i>Registration status:</i>	Health, Standard 08/02/2006 Community services, Standard 29/04/2006 Housing assistance, Standard 10/02/2006
<i>Definition:</i>	The language reported by a person as the main language other than English spoken by that person in his/her home (or most recent private residential setting occupied by the person) to communicate with other residents of the home or setting and regular visitors, as represented by a code.
Data Element Concept:	Person – main language other than English spoken at home

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	Australian Standard Classification of Languages 2005
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	NN{NN}
<i>Maximum character length:</i>	4

Collection and usage attributes

Guide for use: The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure. The most detailed level of the classification consists of base units (languages) which are represented by four-digit codes. The second level of the classification comprises narrow groups of languages (the Narrow Group level), identified by the first two digits. The most general level of the classification consists of broad groups of languages (the Broad Group level) and is identified by the first digit. The classification includes Australian Indigenous languages and sign languages.

For example, the Lithuanian language has a code of 3102. In this case 3 denote that it is an Eastern European language, while 31 denote that it is a Baltic language. The Pintupi Aboriginal language is coded as 8713. In this case 8 denote that it is an Australian Indigenous language and 87 denote that the language is Western Desert language.

Language data may be output at the Broad Group level, Narrow Group level or base level of the classification. If necessary significant Languages within a Narrow Group can be presented separately while the remaining Languages in the Narrow Group

are aggregated. The same principle can be adopted to highlight significant Narrow Groups within a Broad Group.

Data element attributes

Collection and usage attributes

Collection methods:

Recommended question:

Do you/Does the person/Does (name) speak a language other than English at home? (If more than one language, indicate the one that is spoken most often.)

No (English only) ____

Yes, Italian ____

Yes, Greek ____

Yes, Cantonese ____

Yes, Arabic ____

Yes, Mandarin ____

Yes, Vietnamese ____

Yes, Spanish ____

Yes, German ____

Yes, Hindi ____

Yes, Other (please specify) _____

This list reflects the nine most common languages other than English spoken in Australia.

Languages may be added or deleted from the above short list to reflect characteristics of the population of interest.

Alternatively a tick box for 'English' and an 'Other - please specify' response category could be used.

Comments:

This metadata item is consistent with that used in the Australian Census of Population and Housing and is recommended for use whenever there is a requirement for comparison with Census data.

This data element is important in identifying those people most likely to suffer disadvantage in terms of their ability to access services due to language and/or cultural difficulties. In conjunction with Indigenous status, Proficiency in spoken English and Country of birth this data element forms the minimum core set of cultural and language indicators recommended by the Australian Bureau of Statistics (ABS).

Data on main language other than English spoken at home are regarded as an indicator of 'active' ethnicity and also as useful for the study of inter-generational language retention. The availability of such data may help providers of health and community services to effectively target the geographic areas or population groups that need those services. It may be used for the investigation and development of language services such as interpreter/ translation services.

Main occupation of person

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – occupation (main), code (ANZSCO 1st edition) N[NNN]{NN}
<i>METeOR identifier:</i>	350899
<i>Registration status:</i>	Health, Standard 04/07/2007 Community services, Standard 27/03/2007 Housing assistance, Standard 10/08/2007
<i>Definition:</i>	The job in which the person is principally engaged, as represented by a code.
Data Element Concept:	Person – occupation (main)

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	Australian and New Zealand Standard Classification of Occupations, First edition, 2006
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	N[NNN]{NN}
<i>Maximum character length:</i>	6

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A job in any given establishment is a set of tasks designed to be performed by one individual in return for a wage or salary. For persons with more than one job, the main job is the one in which the person works the most hours.</p> <p>Caution is advised in its use with regard to service providers as their activity as a service provider may not be their main occupation.</p>
<i>Collection methods:</i>	<p>This metadata item should only be collected from people whose Labour force status is employed.</p> <p>Occupation is too complex and diverse an issue to fit neatly into any useable small group of categories. Therefore ABS recommend that this metadata item be collected by using the following two open-ended questions:</p> <p>Q1. In the main job held last week (or other recent reference period), what was your/the person's occupation?</p> <p>Q2. What are the main tasks that you/the person usually perform in that occupation? The information gained from these two questions can then be used to select an appropriate code from the ANZSCO at any of the available levels (see Guide for use section).</p>

If only one question is asked, question one should be used. The use of question one only, however, sometimes elicits responses which do not provide a clear occupation title and specification of tasks performed. As a result accurate coding at unit group or occupation level may not be possible.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, due to the complexities of the metadata item 'Main occupation of person', this will result in inaccurate information. The recommended question should be used wherever possible.

Comments:

This metadata item may be useful in gaining an understanding of a client's situation and needs. For example, the occupation of a person with a disability may be directly relevant to the type of aids that they require.

National Health Data Dictionary (NHDD) specific:

Injury surveillance - There is considerable user demand for data on occupation-related injury and illness, including from WorkSafe Australia and from industry, where unnecessary production costs are known in some areas and suspected to be related to others in work-related illness, injury and disability.

<i>Guide for use:</i>	<p>CODE 1 Withdrawal management (detoxification)</p> <p>This code refers to any form of withdrawal management, including medicated and non-medicated, in any delivery setting.</p> <p>CODE 2 Counselling</p> <p>This code refers to any method of individual or group counselling directed towards identified problems with alcohol and/or other drug use or dependency. This code excludes counselling activity that is part of a rehabilitation program as defined in Code 3.</p> <p>CODE 3 Rehabilitation</p> <p>This code refers to an intensive treatment program that integrates a range of services and therapeutic activities that may include counselling, behavioural treatment approaches, recreational</p>
-----------------------	--

activities, social and community living skills, group work and relapse prevention. Rehabilitation treatment can provide a high level of support (i.e. up to 24 hours a day) and tends towards a medium to longer-term duration. Rehabilitation activities can occur in residential or non-residential settings. Counselling that is included within an overall rehabilitation program should be coded to Code 3 for Rehabilitation, not to Code 2 as a separate treatment episode for counselling.

CODE 4 Pharmacotherapy

Refers to pharmacotherapies that include those used as maintenance therapies (e.g. naltrexone, buprenorphine, and methadone treatment) and those used as relapse prevention. Use Code 1 (withdrawal management) where a pharmacotherapy is used solely for withdrawal. Note collection exclusions: excludes treatment episodes for clients who are on an opioid pharmacotherapy maintenance program and are not receiving any other form of treatment.

CODE 5 Support and case management only

Refers to when there is no treatment provided to the client other than support and case management (e.g. treatment provided through youth alcohol and drug outreach services). This choice only applies where support and case management treatment is recorded as individual client data and the treatment activity is not included in any other category.

CODE 6 Information and education only

Refers to when there is no treatment provided to the client other than information and education. It is noted that, in general, service contacts would include a component of information and education.

CODE 7 Assessment only

Refers to when there is no treatment provided to the client other than assessment. It is noted that, in general, service contacts would include an assessment component.

Data element attributes

Collection and usage attributes

Guide for use:

Only one code to be selected.

To be completed at assessment or commencement of treatment.

The main treatment type is the principal activity as judged by the treatment provider that is necessary for the completion of the treatment plan for the principal drug of concern. The main treatment type for alcohol and other drugs is the principal focus of a single treatment episode. Consequently, each treatment episode will only have one main treatment type.

For brief interventions, the main treatment type may apply to as few as one contact between the client and agency staff.

Comments:

Information about treatment provided is of fundamental importance to service delivery and planning.

<i>Classification scheme:</i>	Australian Refined Diagnosis Related Groups version 6
<i>Representation class:</i>	Code
<i>Data type:</i>	String
<i>Format:</i>	NN
<i>Maximum character length:</i>	2

Data element attributes

Collection and usage attributes

<i>Comments:</i>	This metadata item has been created to reflect the development of Australian refined diagnosis related groups (AR-DRGs) (as defined in the metadata item Episode of admitted patient care – diagnosis related group, code (AR-DRG v 6) ANNA) by the Commonwealth Department of Health and Ageing. Due to the modifications in the diagnosis related group logic for the AR-DRGs, it is necessary to generate the major diagnostic category to accompany each diagnosis related group. The construction of the pre-major diagnostic category logic means diagnosis related groups are no longer unique. Certain pre-major diagnostic category diagnosis related groups may occur in more than one of the 23 major diagnostic categories.

<i>Guide for use:</i>	Refers to the current marital status of a person. CODE 2 Widowed This code usually refers to registered marriages but when self reported may also refer to de facto marriages. CODE 4 Separated This code refers to registered marriages but when self reported may also refer to de facto marriages. CODE 5 Married (registered and de facto) Includes people who have been divorced or widowed but have since re-married, and should be generally accepted as applicable to all de facto couples, including of the same sex. CODE 6 Not stated/inadequately described This code is not for use on primary collection forms. It is
-----------------------	---

primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Source and reference attributes

Origin: The ABS standards for the collection of Social and Registered marital status appear on the ABS Website. Australian Bureau of Statistics. [Family, household and income unit variables. Cat. no. 1286.0.](#) Canberra: ABS.

Data element attributes

Collection and usage attributes

Collection methods: This metadata item collects information on social marital status. The recommended question module is:

Do you/Does the person usually live with a partner in a registered or de facto marriage?

Yes, in a registered marriage

Yes, in a de facto marriage

No, never married

No, separated

No, divorced

No, widowed

It should be noted that information on marital status is collected differently by the ABS, using a set of questions. However, the question outlined above is suitable and mostly sufficient for use within the health and community services fields. See Source document for information on how to access the ABS standards.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, the recommended question should be used wherever practically possible.

Comments: The ABS standards identify two concepts of marital status:

- Registered marital status - defined as whether a person has, or has had, a registered marriage;
- Social marital status - based on a person's living arrangement (including de facto marriages), as reported by the person.

It is recommended that the social marital status concept be collected when information on social support/home arrangements is sought, whereas the registered marital status concept need only be collected where it is specifically required for the purposes of the collection.

While marital status is an important factor in assessing the type and extent of support needs, such as for the elderly living in the home environment, marital status does not adequately address the need for information about social support and living

arrangement and other data elements need to be formulated to capture this information.

Value	Meaning				
999	Not stated/inadequately described				

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Stenosis represents the percentage of occlusion, from 0 to 100%, associated with the identified vessel system. Percent stenosis at its maximal point is estimated to be the amount of reduction in the diameter of the 'normal' vessel proximal and distal to the lesion. In instances where multiple lesions are present in a coronary artery, record the highest percentage stenosis noted.
<i>Collection methods:</i>	This data is derived from visual recording by the physician reporting the angiogram.

The list of visas is subject to changes which may be applied by the Department of Immigration and Multicultural Affairs.
-----------------------	--

- American Fulbright scholars studying in Australia (but not their dependents)
- Diplomats and their dependants from reciprocal health countries (excluding New Zealand and Norway) have full access to Medicare without the restrictions for American Fulbright scholars.

Reciprocal health care agreements

Residents of countries with whom Australia has Reciprocal health care agreements are also eligible under certain circumstances. Australia has Reciprocal Health Care Agreements with Ireland, Italy, Finland, Malta, the Netherlands, New Zealand, Norway, Sweden and the United Kingdom. These Agreements give visitors from these countries access to Medicare and the Pharmaceutical Benefits Scheme for the treatment of an illness or injury which occurs during their stay, and which requires treatment before returning home (that is, these Agreements cover immediately necessary medical treatment, elective treatment is not covered). The Agreements provide for free accommodation and treatment as public hospital services, but do not cover treatment as a private patient in any kind of hospital.

- The Agreements with Finland, Italy, Malta, the Netherlands, Norway, Sweden and the United Kingdom provide free care as a public patient in public hospitals, subsidised out-of-hospital medical treatment under Medicare, and subsidised medicines under the Pharmaceutical Benefits Scheme.

- The Agreements with New Zealand and Ireland provide free care as a public patient in public hospitals and subsidised medicines under the Pharmaceutical Benefits Scheme, but do not cover out-of-hospital medical treatment.

- Visitors from Italy and Malta are covered for a period of six months from the date of arrival in Australia only.

Eligible patients may elect to be treated as either a public or a private patient.

A newborn will usually take the Medicare eligibility status of the mother. However, the eligibility status of the father will be applied to the newborn if the baby is not eligible solely by virtue of the eligibility status of the mother.

For example, if the mother of a newborn is an ineligible person but the father is eligible for Medicare, then the newborn will be eligible for Medicare.

Not eligible/ineligible: means any person who is not Medicare eligible. Ineligible patients may not elect to be treated as a public patient.

Prisoners are ineligible for Medicare, under Section 19 (2) of the Health Insurance Act 1973.

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 Involuntary patient</p> <p>Involuntary patient should only be used by facilities which are approved for this purpose. While each state and territory mental health legislation differs in the number of categories of involuntary patient that are recognised, and the specific titles and legal conditions applying to each type, the legal status categories which provide for compulsory detention or compulsory treatment of the patient can be readily differentiated within each jurisdiction. These include special categories for forensic patients who are charged with or convicted of some form of criminal activity. Each state/territory health authority should identify which sections of their mental health legislation provide for detention or compulsory treatment of the patient and code these as involuntary status.</p> <p>CODE 2 Voluntary patient</p> <p>Voluntary patient to be used for reporting to the NMDS-Community mental health care, where applicable.</p>
-----------------------	---

CODE 3 Not permitted to be reported under legislative arrangements in the jurisdiction

Not permitted to be reported under legislative arrangements in the jurisdiction, is to be used for reporting to the National Minimum Data Set - Community mental health care, where applicable.

Data element attributes

Collection and usage attributes

Guide for use:

The mental health legal status of admitted patients treated within approved hospitals may change many times throughout the episode of care.

Patients may be admitted to hospital on an involuntary basis and subsequently be changed to voluntary status; some patients are admitted as voluntary but are transferred to involuntary status during the hospital stay. Multiple changes between voluntary and involuntary status during an episode of care in hospital or treatment in the community may occur depending on the patient's clinical condition and his/her capacity to consent to treatment.

Similarly, the mental health legal status of residents treated within residential care services may change on multiple occasions throughout the episode of residential care or residential stay.

Collection methods:

Admitted patients to be reported as involuntary if the patient is involuntary at any time during the episode of care.

Residents in residential mental health services to be reported as involuntary if the resident is involuntary at any time during the episode of residential care.

Patients of ambulatory mental health care services to be reported as involuntary if the patient is involuntary at the time of a service contact.

Mental health service contact date

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Mental health service contact – service contact date, DDMMYYYY
<i>METeOR identifier:</i>	295481
<i>Registration status:</i>	Health, Standard 08/12/2004
<i>Definition:</i>	The date of each mental health service contact between a health service provider and patient/client.
Data Element Concept:	Mental health service contact – service contact date

Value domain attributes

Representational attributes

<i>Representation class:</i>	Date
<i>Data type:</i>	Date/Time
<i>Format:</i>	DDMMYYYY
<i>Maximum character length:</i>	8

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	Requires services to record the date of each service contact, including the same date where multiple visits are made on one day (except where the visits may be regarded as a continuation of the one service contact). Where an individual patient/client participates in a group activity, a service contact date is recorded if the person's participation in the group activity results in a dated entry being made in the patient's/client's record. For collection from community based (ambulatory and non-residential) agencies.
<i>Comments:</i>	The service contact is required for clinical audit and other quality assurance purposes.

Morphology of cancer

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person with cancer – morphology of cancer, code (ICDO-3) NNNN/N
<i>METeOR identifier:</i>	370023
<i>Registration status:</i>	Health, Standard 06/03/2009
<i>Definition:</i>	The histological classification of the cancer tissue (histopathological type) and a description of the course of development that a tumour is likely to take: benign or malignant (behaviour), as represented by a code.
Data Element Concept:	Person with cancer – morphology of cancer

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	International Classification of Diseases for Oncology 3rd edition
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	NNNN/N
<i>Maximum character length:</i>	5

Collection and usage attributes

<i>Guide for use:</i>	<p>ICDO morphology describes histology and behaviour as separate variables, recognising that there are a large number of possible combinations.</p> <p>In ICDO, morphology is a 4-digit number ranging from 8000 to 9989, and behaviour is a single digit which can be 0, 1, 2, 3, 6 or 9.</p> <p>Record morphology codes in accordance with ICDO coding standards. Use the 5th-digit to record behaviour. The 5th-digit behaviour code numbers used in ICDO are listed below:</p> <p>0 Benign</p> <p>1 Uncertain whether benign or malignant</p> <ul style="list-style-type: none">• borderline malignancy• low malignant potential <p>2 Carcinoma in situ</p> <ul style="list-style-type: none">• intraepithelial• non-infiltrating• non-invasive <p>3 Malignant, primary site</p> <p>6 Malignant, metastatic site</p> <ul style="list-style-type: none">• malignant, secondary site <p>9 Malignant, uncertain whether primary or metastatic site</p>
-----------------------	--

Source and reference attributes

Origin: International Classification of Diseases for Oncology, Third Edition (ICDO-3)

Data element attributes

Collection and usage attributes

Collection methods: Cancer registry use:
Collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease.
Morphology information should be obtained from a pathology report or pathology system, and recorded with/on the patient's medical record and/or the hospital's patient administration system. Additional information may also be sought from the patient's attending clinician or medical practitioner.
If the morphology differs on multiple pathology reports for the same tumour, use the value from the most representative tumour specimen examined. For example, if tumour is described as ductal on core biopsy but undifferentiated carcinoma on the excision specimen the morphology would be coded as undifferentiated carcinoma (a lower code) which has a less favourable diagnosis.
Hospital morbidity use:
In hospitals, the morphology code is modified for use with ICD-10-AM. The morphology code consists of histologic type (4 digits) and behaviour code (1 digit) ranging from 8000/0 to 9989/9.

Guide for use:

CODES 1 - 4

Non-microscopic.

CODES 5 - 8

Microscopic.

CODE 9

Other.

Comments:

In a hospital setting this metadata item should be collected on the most valid basis of diagnosis at this admission. If more than one diagnosis technique is used during an admission, select the higher code from 1 to 8.

Data element attributes

Collection and usage attributes

Guide for use:

The most valid basis of diagnosis may be the initial histological examination of the primary site, or it may be the post-mortem examination (sometimes corrected even at this point when histological results become available). In a cancer registry setting, this metadata item should be revised if later information allows its upgrading.

When considering the most valid basis of diagnosis, the minimum requirement of a cancer registry is differentiation between neoplasms that are verified microscopically and those that are not. To exclude the latter group means losing valuable information; the making of a morphological (histological) diagnosis is dependent upon a variety of factors, such as age, accessibility of the tumour, availability of medical services, and, last but not least, upon the beliefs of the patient.

A biopsy of the primary tumour should be distinguished from a biopsy of a metastasis, e.g., at laparotomy; a biopsy of cancer of the head of the pancreas versus a biopsy of a metastasis in the mesentery. However, when insufficient information is available, Code 8 should be used for any histological diagnosis. Cytological and histological diagnoses should be distinguished.

Morphological confirmation of the clinical diagnosis of malignancy depends on the successful removal of a piece of tissue that is cancerous. Especially when using endoscopic procedures (bronchoscopy, gastroscopy, laparoscopy, etc.), the clinician may miss the tumour with the biopsy forceps. These cases must be registered on the basis of endoscopic diagnosis and not excluded through lack of a morphological diagnosis.

Care must be taken in the interpretation and subsequent coding of autopsy findings, which may vary as follows:

- a) the post-mortem report includes the post-mortem histological diagnosis (in which case, one of the Histology codes should be recorded instead);
- b) the autopsy is macroscopic only, histological investigations

having been carried out only during life (in which case, one of the Histology codes should be recorded instead);

c) the autopsy findings are not supported by any histological diagnosis.

4	Alias name										

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>A person may have more than one name that they use. At least one name must be recorded for each person. Each name recorded must have one or more appropriate Person name type associated with it. Record all that are required.</p> <p>One name is sufficient; however, where the person offers more than one name, clarification should be obtained from the person to ensure accurate identification of the person and recording of the various names. The currently used name, as well as names by which the person has previously been known, should be recorded if these are known.</p> <p>Field value definitions for Person name type codes are:</p> <p>CODE 1 Preferred name is the name by which the person chooses to be identified.</p> <p>There should only be one preferred name recorded for a person. Where the person changes their preferred name, record the previously recorded preferred name as an Alias name. Preferred name is the default name type (i.e. if only one name is recorded it</p>
-----------------------	--

should be the person's preferred name). There must be a preferred name recorded except for unnamed newborns where the newborn name is the only name recorded.

Also, if the person is a health care client, record his/her Medicare card name if different to the preferred name, and any known alias names.

CODE 2 Medicare name for a health care client, this is the person's name as it appears on their Medicare card. The name stated on the Medicare card is required for all electronic Medicare claim lodgement. If the preferred name of the person is different to the name on the Medicare card, the Medicare card name should also be recorded. For an individual health care provider, this is the person's name registered by Medicare (Health Insurance Commission).

CODE 3 Newborn name: type is reserved for the identification of unnamed newborn babies.

CODE 4 Alias name is any other name that a person is also known by, or has been known by in the past; that is, all alias names. This includes misspelt names or name variations that are to be retained as they have been used to identify this person. More than one alias name may be recorded for a person.

Collection and usage attributes

<i>Guide for use:</i>	<p>CODE 1 Organisation unit/section/division This code is used where a business unit, section or division within an organisation may have its own separate identity.</p> <p>CODE 2 Service location name This code is used where the service location name is an important part of the organisation name and is used for identification purposes, e.g. Mobile Immunisation Unit at Bankstown.</p> <p>CODE 3 Business name Business name used only for trading purposes.</p> <p>CODE 4 Locally used name This code is used where a local name is used, e.g. where a medical practice is known by a name that is different to the company registration name or business name.</p>
-----------------------	---

CODE 5 Abbreviated name

A short name or an abbreviated name by which the organisation is known, e.g. HIC.

CODE 6 Enterprise name

Generally, the complete organisation name should be used to avoid any ambiguity in identification. This should usually be the same as company registration name.

CODE 8 Other

This code is used when the organisation name does not fit into any one of the categories listed above.

CODE 9 Unknown

This code is used when the organisation name type is unknown.

Data element attributes

Collection and usage attributes

Guide for use:

At least one organisation name must be recorded for each organisation and each name must have an appropriate Organisation name type.

Narrative description of injury event

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Injury event – external cause, text [X(100)]
<i>METeOR identifier:</i>	268946
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	A textual description of the environmental event, circumstance or condition as the cause of injury, poisoning and other adverse effect.
Data Element Concept:	Injury event – external cause

Value domain attributes

Representational attributes

<i>Representation class:</i>	Text
<i>Data type:</i>	String
<i>Format:</i>	[X(100)]
<i>Maximum character length:</i>	100

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Write a brief description of how the injury occurred. It should indicate what went wrong (the breakdown event); the mechanism by which this event led to injury; and the object(s) or substance(s) most important in the event. The type of place at which the event occurred, and the activity of the person who was injured should be indicated.
<i>Comments:</i>	<p>The narrative of the injury event is very important to injury control workers as it identifies features of the event not revealed by coded data.</p> <p>This is a basic item for injury surveillance. The text description of the injury event is structured to indicate context, place, what went wrong and how the event resulted in injury. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.</p>

Value	Meaning																
1	The service unit had been reviewed by an external accreditation agency and was judged to have met the National standards																
2	The service unit had been reviewed by an external accreditation agency and was judged to have met some but not all of the National standards																
3	The service unit was in the process of being reviewed by an external accreditation agency but the outcomes were not known																
4	The service unit was booked for review by an external accreditation agency and was engaged in self-assessment preparation prior to the formal external review																
5	The service unit was engaged in self-assessment in relation to the National Standards but did not have a contractual arrangement with an external accreditation agency for review																
6	The service unit had not commenced the preparations for review by an external accreditation agency but this was intended to be undertaken in the future																
7	It had not been resolved whether the service unit would undertake review by an external accreditation agency under the National standards																

8 The National standards are not applicable to this service unit

Collection and usage attributes

Guide for use:

Code 8 The National standards are not applicable to this service unit

This code should only be used for:

- non-government organisation mental health services and private hospitals (that receive some government funding to provide specialised mental health services) where implementation of National standards for mental health services has not been agreed with the relevant state or territory; or
- those aged care residential services (e.g. psychogeriatric nursing homes) in receipt of funding under the *Aged Care Act* and subject to Commonwealth residential aged care reporting and service standards requirements.

Data element attributes

Collection and usage attributes

Collection methods:

Report the review/accreditation status at 30 June for each service unit for the National standards for mental health services using the standard set of codes shown in the value domain.

For organisations that include more than one service unit the codes relating to each service should be completed. Reporting of progress at the individual service unit level recognises that parts rather than whole organisations may be implementing the standards.

NOTE: for admitted patient setting only, these data need to be disaggregated by specialised mental health service program type and specialised mental health service target population.

27	Other specified nature of injury
28	Injury of unspecified nature
29	Multiple injuries of more than one 'nature'
30	No injury detected

Data element attributes

Collection and usage attributes

Guide for use:

If the full ICD-10-AM code is used to code the injury, this metadata item is not required (see metadata items principal diagnosis and additional diagnosis) When coding to the full ICD-10-AM code is not possible, use this metadata item with the items external cause of injury-non admitted patient, external cause of injury-human intent and bodily location of main injury.

Select the code which best characterises the nature of the injury chiefly responsible for the attendance, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate, select the one that comes first in the code list. A major injury, if present, should always be coded rather than a minor injury. If a major injury has been sustained (e.g. a fractured femur), along with one or more minor injuries (e.g. some small abrasions), the major injury should be coded in preference to coding 'multiple injuries'. As a general guide, an injury which, on its own, would be unlikely to have led to the attendance may be regarded as 'minor'.

If the nature of the injury code is 01 to 12 or 26 to 29 then the metadata item Bodily location of main injury should be used to record the bodily location of the injury. If another code is used, bodily location is implicit or meaningless. Bodily location of main injury, category 22 may be used as a filler to indicate that specific body region is not required.

Comments:

Injury diagnosis is necessary for purposes including epidemiological research, casemix studies and planning. This metadata item together with the metadata item bodily location of the main injury indicates the diagnosis.

This metadata item is related to the ICD-10-AM injury and poisoning classification. However, coding to the full ICD-10-AM injury and poisoning classification (see metadata item principal diagnosis) is not available in most settings where basic injury surveillance is undertaken. This item, in combination with the metadata item Bodily location of main injury, is a practicable alternative. Data coded to the full ICD-10-AM codes can be aggregated to match this item, facilitating data comparison. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

Neo-adjuvant therapy

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person with cancer – neoadjuvant therapy indicator, code N
<i>METeOR identifier:</i>	370014
<i>Registration status:</i>	Health, Standard 06/03/2009
<i>Definition:</i>	Whether a person with a solid tumour has received neoadjuvant therapy, as represented by a code.
Data Element Concept:	Person with cancer – neoadjuvant therapy indicator

Value domain attributes

Representational attributes

<i>Representation class:</i>	Code						
<i>Data type:</i>	Boolean						
<i>Format:</i>	N						
<i>Maximum character length:</i>	1						
<i>Permissible values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>1</td><td>Yes</td></tr><tr><td>2</td><td>No</td></tr></tbody></table>	Value	Meaning	1	Yes	2	No
Value	Meaning						
1	Yes						
2	No						

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>To be reported when therapy is received after a diagnosis of cancer and prior to primary surgical treatment.</p> <p>This data item is used to flag cases in which tumour descriptors, for example solid tumour size, may be inaccurate due to shrinkage from neoadjuvant therapy.</p> <p>Yes - indicates that the client has received neo-adjuvant therapy after a diagnosis of cancer and prior to primary surgical treatment</p> <p>No - indicates that the client did not receive neo-adjuvant therapy after a diagnosis of cancer and prior to primary surgical treatment</p> <p>For invasive breast cancer:</p> <p>Information is obtained from</p> <ul style="list-style-type: none">• Clinical notes on pathology report mentions that patient underwent chemotherapy prior to surgery• Microscopy section of pathology report describes tumour changes as a result of neoadjuvant therapy (coder may be alerted to look for this detail by a long interval between biopsy and wider excision)
-----------------------	--

- Hospital notification indicates that admission is for chemotherapy only (and admission date is before that for surgery)

Comments:

Preoperative chemotherapy and/or radiotherapy may be received after a diagnosis of cancer but before surgical treatment.

The effects of chemotherapy and/or radiotherapy prior to surgery will shrink the tumour and so the size of the tumour found from the subsequent surgical excision will be smaller than the original size of the tumour at the time of diagnosis. This impacts on the TNM-T and staging classification, and is important to take into account for analysis and research.

Number of contacts—psychiatric outpatient clinic/day program

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Patient—number of psychiatric outpatient clinic/day program attendances (financial year), total days N[NN]
<i>METeOR identifier:</i>	270121
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	Number of days that a patient attended a psychiatric outpatient clinic or a day program during the relevant financial year.
Data Element Concept:	Patient—number of psychiatric outpatient clinic/day program attendances

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NN]
<i>Maximum character length:</i>	3
<i>Unit of measure:</i>	Day

Data element attributes

Collection and usage attributes

<i>Collection methods:</i>	All States and Territories where there are public psychiatric hospitals also collect date of contact, and number of contacts during the financial year can be derived from this. (Collection status for New South Wales is unknown at time of writing.)
<i>Comments:</i>	<p>This metadata item gives a measure of the level of service provided.</p> <p>In December 1998, the National Health Information Management Group decided that the new version of this metadata item (named Person—number of service contact dates, total N[NN]) would be implemented from 1 July 2000 in the Community Mental Health National Minimum Data Set (NMDS). Until then agencies involved in the Community mental health NMDS may report either Patient—number of psychiatric outpatient clinic/day program attendances (financial year), total days N[NN] or Person—number of service contact dates, total N[NN] with the expectation that agencies will make their best efforts to report against the new version of this metadata item (Person—number of service contact dates, total N[NN]) from 1 July 1999.</p>

Number of days in special/neonatal intensive care

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of admitted patient care – length of stay (special/neonatal intensive care), total days N[NN]
<i>METeOR identifier:</i>	270057
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The total number of days spent by a neonate in a special care or neonatal intensive care nursery (in the hospital of birth).
Data Element Concept:	Episode of admitted patient care – length of stay (special/neonatal intensive care)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NN]
<i>Maximum character length:</i>	3
<i>Unit of measure:</i>	Day

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The number of days is calculated from the date the baby left the special/neonatal intensive care unit minus the date the baby was admitted to the special/neonatal intensive care unit.
<i>Collection methods:</i>	This item is to be completed if baby has been treated in an intensive care unit or a special care nursery (SCN).
<i>Comments:</i>	<p>An indicator of the requirements for hospital care of high-risk babies in specialised nurseries that add to costs because of extra staffing and facilities.</p> <p>SCN are staffed and equipped to provide a full range of neonatal services for the majority of complicated neonatal problems, including short-term assisted ventilation and intravenous therapy.</p> <p>Neonatal intensive care nurseries (NICN) are staffed and equipped to treat critically ill newborn babies including those requiring prolonged assisted respiratory support, intravenous therapy, and alimentation and treatment of serious infections. Full supportive services are readily available throughout the hospital. These NICN also provide consultative services to other hospitals.</p>

Number of episodes of angina in last 24 hours

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Person – angina episodes count (24 hours preceding hospital presentation), total number NN[N]
<i>METeOR identifier:</i>	338293
<i>Registration status:</i>	Health, Standard 01/10/2008
<i>Definition:</i>	The number of angina episodes experienced by a person in the 24 hours preceding presentation to the hospital, including the current episode.
Data Element Concept:	Person – count of angina episodes

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total	
<i>Data type:</i>	Number	
<i>Format:</i>	NN[N]	
<i>Maximum character length:</i>	3	
<i>Supplementary values:</i>	Value	Meaning
	999	Not stated/inadequately described

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Is the total number of distinct episodes of anginal pain that occurred in the 24 hours preceding presentation to the hospital, including the current episode for which the person presented to hospital. An episode of angina may include chest pain (which may spread to either or both shoulders, the back, neck, jaws or down the arm) or overwhelming shortness of breath.
<i>Collection methods:</i>	Ask the individual how many distinct episodes of anginal pain he/she experienced in the 24 hours preceding presentation to hospital, including the current episode. Alternatively, if available, obtain this information from appropriate documentation.

Collection and usage attributes

<i>Guide for use:</i>	<p>A group is defined as two or more patients receiving the same services at the same time from the same hospital staff at the same clinics.</p> <p>The following guides for use apply:</p> <ul style="list-style-type: none">• a group session is counted only for two or more patients attending in the capacity of patients in their own right, even if other non-patient persons are present for the service.• Spouses, parents or carers attending the session are counted for the group session only if they are also participating in the service as a patient.• A group session is counted for staff attending clinics only if they are attending as a patient in their own right. Staff training and education is excluded.• A group session may be delivered by more than one provider. A group session is counted for two or more patients receiving the same services, even if more than one provider delivers that service simultaneously.• Patients attending for treatment at a dialysis or a chemotherapy clinic are receiving individual services. Patients attending education sessions at chemotherapy or
-----------------------	--

dialysis clinics are counted as group sessions, if two or more people are receiving the same services at the same time.

Collection methods:

Where a patient receives multidisciplinary care within one booked clinic appointment as part of a group, one group session shall be recorded, regardless of the number of providers involved. For example, if a group session is jointly delivered by a physiotherapist and an occupational therapist, one group session is counted for the patients attending that session.

Data Element Concept:	Establishment – number of occasions of service

Value domain attributes

Representational attributes

<i>Representation class:</i>	Total
<i>Data type:</i>	Number
<i>Format:</i>	N[NNNNNN]
<i>Maximum character length:</i>	7
<i>Unit of measure:</i>	Occasion of service

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	The following guides for use apply: <ul style="list-style-type: none">• an occasion of service is counted for each person attending in the capacity of a patient in their own right, even if other non-patient persons are present for the service.• spouses, parents or carers attending the session are only counted if they are also participating in the service as a patient.• in the instance of a dependent child presenting to a clinic, the session is counted as a single Occasion of Service provided to the individual child for whom an event history is being recorded. Where parents/carers also attend in the capacity of patients themselves within a booked appointment, and receive the same services at the same time, the child and parent/carer can be counted as a group. In this instance a Group Session count would be recorded.• An occasion of service is counted for staff attending clinics of public hospitals only if they are attending as patients in their own right. Staff education and training is excluded.• Patients attending for treatment at a dialysis or a chemotherapy clinic are receiving individual services. Patients attending education sessions at chemotherapy or
-----------------------	---

Collection methods:

dialysis clinics are counted as group sessions, if two or more people receiving the same services at the same time.

- Where a patient receives the occasion of service is counted at the clinic of the public hospital where the patient is booked.
- Where a patient receives multidisciplinary care, within one booked clinic appointment by themselves, one occasion of service shall be recorded, regardless of the number of providers involved.
- Where patients have received more than one booked appointment, each appointment will be counted as one occasion of service. (Example: three booked appointments with all services provided on a single day will be counted as three occasions of service).
- The occasion of service count should be attributed to the clinic type associated with the booked appointment.
- Services to individual patients should be counted separately from services to groups of patients. An occasion of service is counted only for a service provided to an individual. Group sessions are reported separately under 'Establishment - number of group sessions total N[NNNNNN]'.

Number of tobacco cigarettes smoked per day after 20 weeks of pregnancy

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Female (pregnant) – number of cigarettes smoked (per day after 20 weeks of pregnancy), number N[NN]
<i>METeOR identifier:</i>	365445
<i>Registration status:</i>	Health, Standard 03/12/2008
<i>Definition:</i>	The self-reported number of cigarettes usually smoked daily by a pregnant woman after the first 20 weeks of pregnancy until the birth
<i>Context:</i>	Perinatal Statistics
<i>Data Element Concept:</i>	Female (pregnant) – number of cigarettes smoked (after 20 weeks of pregnancy)

Value domain attributes

Representational attributes

<i>Representation class:</i>	Quantity						
<i>Data type:</i>	Number						
<i>Format:</i>	N[NN]						
<i>Maximum character length:</i>	3						
<i>Supplementary values:</i>	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>998</td><td>Occasional smoking (less than one)</td></tr><tr><td>999</td><td>Not stated/inadequately described</td></tr></tbody></table>	Value	Meaning	998	Occasional smoking (less than one)	999	Not stated/inadequately described
Value	Meaning						
998	Occasional smoking (less than one)						
999	Not stated/inadequately described						

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Data should be collected after the birth. 'After 20 weeks' is defined as greater than or equal to 20 completed weeks' gestation (≥ 20 weeks + 0 days). 'Usually' is defined as 'according to established, or frequent usage; commonly, ordinarily; as a rule'. If a woman reports having quit smoking at some point between 20 weeks of pregnancy and the birth, the value recorded should be the number of cigarettes usually smoked daily prior to quitting.
<i>Collection methods:</i>	Recommended question: 'How many tobacco cigarettes did the woman usually smoke each day after 20 weeks of pregnancy?', where after 20 weeks of pregnancy is defined as greater than or equal to 20 weeks + 0 days. If a woman did not smoke tobacco cigarettes at any time after 20 weeks of pregnancy, a value of 000 should be recorded.

Occasional smoking
Women who report that they usually smoked less than one tobacco cigarette per day should have a value recorded of 998.

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	<p>Data should be collected after the first 20 weeks of pregnancy; e.g. the next antenatal visit after the first 20 weeks would be an ideal time.</p> <p>'The first 20 weeks of pregnancy' is defined as less than or equal to 19 weeks + 6 days.</p> <p>'Usually' is defined as 'according to established, or frequent usage; commonly, ordinarily; as a rule'. If a woman reports having quit smoking at some point during the first 20 weeks of pregnancy, the value recorded should be the number of cigarettes usually smoked daily prior to quitting.</p>
<i>Collection methods:</i>	<p>Recommended question: 'How many tobacco cigarettes did the woman usually smoke during the first 20 weeks of pregnancy?', where the first 20 weeks of pregnancy is defined as less than or equal to 19 weeks + 6 days.</p> <p>If a woman did not smoke tobacco cigarettes at any time during the first 20 weeks of pregnancy, a value of 000 should be recorded.</p>

Occasional smoking

Women who report that they usually smoked less than one tobacco cigarette per day should have a value recorded of 998.

Nursing diagnosis—other

Identifying and definitional attributes

<i>Metadata item type:</i>	Data Element
<i>Technical name:</i>	Episode of care – nursing diagnosis (other), code (NANDA 1997-98) N.N[{{.N}}{.N}{.N}{.N}]
<i>METeOR identifier:</i>	270466
<i>Registration status:</i>	Health, Standard 01/03/2005
<i>Definition:</i>	The nursing diagnosis other than the principal nursing diagnosis, as represented by a code.
Data Element Concept:	Episode of care – nursing diagnosis

Value domain attributes

Representational attributes

<i>Classification scheme:</i>	North American Nursing Diagnosis Association (NANDA) Taxonomy 1997-1998
<i>Representation class:</i>	Code
<i>Data type:</i>	Number
<i>Format:</i>	N.N[{{.N}}{.N}{.N}{.N}]
<i>Maximum character length:</i>	6

Collection and usage attributes

<i>Guide for use:</i>	The NANDA codes should be used in conjunction with a nursing diagnosis text. The NANDA coding structure is a standard format for reporting nursing diagnosis. It is not intended in any way to change or intrude upon nursing practice, provided the information available can transpose to the NANDA codes for the Community Nursing Minimum Data Set - Australia (CNMDSA).
-----------------------	--

Data element attributes

Collection and usage attributes

<i>Guide for use:</i>	Up to seven nursing diagnoses may be nominated, according to the following: <ol style="list-style-type: none">1. Nursing diagnosis most related to the principal reason for admission (one only)2-6. Other nursing diagnoses or relevance to the current episode.
<i>Collection methods:</i>	In considering how nursing diagnosis could be implemented, agencies may opt to introduce systems transparent to the clinician if there is confidence that a direct and reliable transfer to NANDA codes can be made from information already in place. Agencies implementing new information systems should consider the extent to which these can facilitate practice and at the same time lighten the burden of documentation. Direct incorporation of the codeset or automated mapping to it when

the information is at a more detailed level are equally valid and viable options.

Comments:

The Community Nursing Minimum Data Set - Australia (CNMDSA) Steering Committee considered information from users of the data in relation to this metadata item. Many users have found the taxonomy wanting in its ability to describe the full range of persons and conditions seen by community nurses in the Australian setting. In the absence of an alternative taxonomy with wide acceptance, the CNMDSA Steering Committee has decided to retain North American Nursing Diagnosis Association (NANDA). The University of Iowa has a written agreement with NANDA to expand the relevance of NANDA. The Australian Council of Community Nursing Services (ACCNS) has sought collaboration with a United States of America project at the University of Iowa which is seeking to refine, extend, validate and classify the NANDA taxonomy.

Collection and usage attributes

<i>Guide for use:</i>	<p>The following definitions are to assist in coding:</p> <p>CODE 1 Coordination and collaboration of care</p> <p>This code occurs when there are multiple care deliverers. The goal of coordination and collaboration is the efficient, appropriate integrated delivery of care to the person. Tasks which may be involved include: liaison, advocacy, planning, referral, information and supportive discussion and/or education. Although similar in nature to formal case management this intervention is not the one formally recognised by specific funding (see Code 8).</p> <p>CODE 2 Supporting information carers</p> <p>This code includes activities, which the nurse undertakes to assist</p>
-----------------------	--

the carer in the delivery of the carer's role. This does not include care given directly to the person. Examples of tasks involved in supporting the carer include: counselling, teaching, informing, advocacy, coordinating, and grief or bereavement support.

CODE 3 General nursing care

This code includes a broad range of activities, which the nurse performs to directly assist the person; in many cases, this assistance will focus on activities of daily living. This assistance will help a person whose health status, level of dependency, and/or therapeutic needs are such that nursing skills are required. Examples of tasks include: assistance with washing, grooming and maintaining hygiene, dressing, pressure area care, assistance with toileting, bladder and bowel care, assistance with mobility and therapeutic exercise, attention to physical comfort and maintaining a therapeutic environment.

CODE 4 Technical nursing treatment or procedure

This code refers to technical tasks and procedures for which nurses receive specific training and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. Some examples of technical care activities are: medication administration (including injections), dressings and other procedures, venipuncture, monitoring of dialysis, and implementation of pain management technology.

CODE 5 Counselling and emotional support

This code focuses on non-physical care given to the person, which aims to address the affective, psychological and/or social needs. Examples of these include: bereavement, well being, decision-making support and values-clarification.

CODE 6 Teaching/education

This code refers to providing information and/or instruction about a specific body of knowledge and/or procedure, which is relevant to the person's situation. Examples of teaching areas include: disease process, technical procedure, health maintenance, health promotion and techniques for coping with a disability.

CODE 7 Monitoring and surveillance

This code refers to any action by which the nurse evaluates and monitors physical, behavioural, social and emotional responses to disease, injury, and nursing or medical interventions.

CODE 8 Formal case management

This code refers to the specific formal service, which is funded to provide case management for a person. Note that coordination and collaboration of care (Code 1) is not the same as formal case management.

CODE 9 Service needs assessment only

This code is for assessment of the person when this is the only activity carried out and no further nursing care is given; for example, assessment for ongoing care and/or inappropriate referrals. Selection of this option means that no other intervention

may be nominated. Thus, if an assessment for the domiciliary care benefit is the reason for a visit, but other interventions such as, counselling and support; coordination/collaboration of care are carried out, then the assessment only is not an appropriate code.

Data element attributes

Collection and usage attributes

Guide for use:

Up to eight codes may be selected. If Code 9 is selected no other nursing interventions are collected. If Code 9 is selected then code 07 in Community nursing service episode – goal of care, code NN must also be selected.

Collection methods:

Collect on continuing basis throughout the episode in the event of data collection that occurs prior to discharge. Up to eight codes may be collected. Within a computerised information system the detailed activities can be mapped to the Community Nursing Minimum Data Set Australia (CNMDSA) interventions enabling the option of a rich level of detail of activities or summarised information.

Comments:

For the purposes of the CNMDSA, the interventions are not necessarily linked to each nursing problem, nor are they specific tasks, but rather, broader-level intervention categories focusing on the major areas of a person's need. These summary categories subsume a range of specific actions or tasks.

The CNMDSA nursing interventions are summary information overlying the detailed nursing activity usually included in an agency data collection. They are not intended as a description of nursing activities in the CNMDSA. For instance, 'technical nursing treatment' or 'procedure' is the generic term for a broad range of nursing activities such as medication administration and wound care management.

Collection of this information at discharge carries with it the expectation that nursing records will lend themselves to this level of summarisation of the care episode. The selection of eight interventions if more are specified is a potentially subjective task unless the nursing record is structured and clear enough to enable such a selection against the reasons for admission to care, and the major focus of care delivery. Clearly, the task is easier if ongoing automated recording of interventions within an agency information system enables discharge reporting of all interventions and their frequency, over a care episode.

Those agencies providing allied health services may wish to use the Physiotherapy and Occupational Therapy Interventions developed in conjunction with the National Centre for Classification in Health in addition to the CNMDSA data element Nursing interventions or other more relevant code sets.

To enable analysis of the interventions within an episode of care, in relation to the outcome of this care, especially when linked with information on the diagnosis and goals. The recording of nursing interventions is critical information for health service

monitoring and planning. It is a major descriptor of the care provided throughout an episode.
