Summary of updates to National Health Data Dictionary (NHDD) since version 15 62

National Health Data Dictionary 84

Data Elements 85

ACCHO/AMS service provider type..........85

ACCHO/AMS visitation frequency 87

Accrued mental health care days 89

Activity and participation life area 92

Activity when injured..........96

Activity when injured (non-admitted patient)..........98

Actual place of birth..........100

Acute coronary syndrome procedure type..........102

Acute coronary syndrome related clinical event type 106

Acute coronary syndrome related medical history 111

Acute coronary syndrome stratum..........116

Additional body function or structure of patient affected 120

Additional clinician specialty involved in health-care incident..........123

Additional diagnosis..........131

Additional incident or allegation type 134

Address line (person)..........141

Address line (service provider organisation)..........144

Address site name 148

Address type (person) 150

Address type (service provider organisation)..........153

Administrative health region name..........155

Administrative health region palliative care strategic plan indicator 156

Admission date..........158

Admission time 160

Admitted patient election status 162

Admitted patient service unit identifier 165

Admitted patient service unit name..........167

Age 169

Age at first pregnancy 171
Age range 172
Alcohol consumption frequency 175
Alcohol consumption frequency (self reported) 177
Alcohol consumption in standard drinks per day (self reported) 178
Alcohol consumption status recorded indicator 182
Ambulatory service unit identifier 184
Ambulatory service unit name 186
Anaesthesia administered for operative delivery of the baby 188
Analgesia administered for labour 190
Angina status 192
Angiotensin converting enzyme (ACE) inhibitors therapy status 194
Antenatal care visits 196
Anticipated patient election status 198
Apgar score at 1 minute 200
Apgar score at 5 minutes 201
Area of practice - dental 203
Area of practice - midwifery 207
Area of practice - nursing 210
Area of practice - psychology 214
Area of usual residence 217
Area of usual residence (SA2) 220
Aspirin therapy status 224
Assistance with activities 226
At risk of suicide or self-harm indicator 229
Australian postcode (address) 231
Australian state of birth 234
Australian state/territory identifier 237
Australian state/territory identifier (establishment) 240
Australian state/territory identifier (jurisdiction) 244
Australian state/territory identifier (service provider organisation) 246
Australian state/territory identifier of address 248
Average available beds for hospital-in-the-home patients 250
Average available beds for overnight-stay patients 252

Average available beds for residential mental health patients....................255
Average available beds for same-day patients....................257
Average available neonatal cots (non-special-care)....................261
Behaviour-related risk factor intervention....................264
Behaviour-related risk factor intervention - purpose....................266
Beta-blocker therapy status....................268
Birth order....................270
Birth plurality....................272
Birth weight....................274
Birth weight recorded indicator....................276
Bleeding episode using TIMI criteria (status)....................277
Blindness (diabetes complication)....................279
Blood pressure measurement result less than or equal to 130/80 mmHg indicator....................281
Blood pressure measurement result recorded indicator....................283
Blood pressure—diastolic (measured)....................284
Blood pressure—systolic (measured)....................288
Blow to the head indicator....................291
Bodily location of main injury....................292
Body function....................295
Body mass index recorded indicator....................299
Body mass index—adult (measured)....................301
Body mass index—adult (self-reported)....................305
Body mass index—child (measured)....................309
Body mass index—child (self-reported)....................313
Body mass index—classification....................317
Body structure....................322
Building/complex sub-unit type—abbreviation (person)....................326
Building/complex sub-unit type—abbreviation (service provider organisation)....................328
Bundle-branch block status....................331
C-reactive protein level (measured)....................333
Caesarean section indicator, last previous birth....................335
Cancer initial treatment completion date....................337
Cancer initial treatment starting date....................338
Cancer staging scheme source edition number....................339

Cancer staging—M stage code 341
Cancer staging—N stage code....................344
Cancer staging—stage grouping other....................347
Cancer staging—T stage code....................349
Cancer staging—TNM stage grouping code 352
Cancer status....................355
Cancer treatment type 357
Cancer treatment—target site (ICD-10-AM) 360
Cancer treatment—target site (ICDO-3) 361
Capital consumption expenses....................362
Cardiovascular disease recorded indicator 365
Cardiovascular medication (current) 367
Care type....................369
Care type, derived subacute 377
Carer participation arrangements—carer consultants employed 380
Carer participation arrangements—carer satisfaction surveys 382
Carer participation arrangements—formal complaints mechanism 384
Carer participation arrangements—formal participation policy 386
Carer participation arrangements—regular discussion groups....................388
Carer responsibility indicator....................390
Cataract - history 392
Category reassignment date 394
Census date 396
Centrelink customer reference number 397
Cerebral stroke due to vascular disease (history)....................399
Cervical screening indicator 401
Change to body structure....................403
Chemotherapy completion date....................407
Chemotherapy cycles administered 409
Chemotherapy start date....................412
Chest pain pattern category....................414
Cholesterol—HDL (measured)....................416
Cholesterol—LDL (calculated)....................418
Cholesterol—total (measured) 420

Chronic condition indicator 422
Chronic obstructive pulmonary disease recorded indicator 424
Class action indicator 426
Classification of health labour force job 428
Client type (alcohol and other drug treatment services) 432
Clinical emergency indicator 434
Clinical evidence of acute coronary syndrome related medical history 435
Clinical procedure timing (status) 439
Clinical service context 440
Clinical service context text 445
Clinical urgency 446
Clopidogrel therapy status 448
Co-location status of mental health service 450
Compensable status 452
Complex road name 454
Complex road number 1 456
Complex road number 2 458
Complex road type 460
Complication of labour and delivery 467
Complications of pregnancy 469
Condition onset flag 471
Congenital malformations 475
Congenital malformations—BPA code 477
Consumer committee representation arrangements 479
Consumer participation arrangements—consumer consultants employed 481
Consumer participation arrangements—consumer satisfaction surveys 483
Consumer participation arrangements—formal complaints mechanism 485
Consumer participation arrangements—formal participation policy 487
Consumer participation arrangements—regular discussion groups 489
Contract establishment identifier 491
Contract procedure flag 492
Contract role 494
Contract type 495
Contracted care commencement date 497

Contracted care completion date 498
Coordinator of volunteers indicator 499
Coronary artery bypass graft location....501
Coronary artery disease—history of intervention or procedure 502
Coronary artery stenosis location 505
Country identifier (person) 507
Country of birth....509
Country of employment in registered profession 513
Creatine kinase isoenzyme—upper limit of normal range (U/L)....515
Creatine kinase level (U/L) 517
Creatine kinase MB isoenzyme level (index code) 519
Creatine kinase MB isoenzyme level (kCat per litre) 521
Creatine kinase MB isoenzyme level (micrograms per litre) 523
Creatine kinase MB isoenzyme level (nanograms per decilitre) 525
Creatine kinase MB isoenzyme level (percentage) 527
Creatine kinase MB isoenzyme level (units per litre) 529
Creatine kinase MB isoenzyme—upper limit of normal range (units per litre)....531
Creatine kinase MB isoenzyme—upper limit of normal range (index code) 533
Creatine kinase MB isoenzyme—upper limit of normal range (kCat per litre) 535
Creatine kinase MB isoenzyme—upper limit of normal range (micrograms per litre) ...537
Creatine kinase MB isoenzyme—upper limit of normal range (nanograms per decilitre)....539
Creatine kinase MB isoenzyme—upper limit of normal range (percentage) 541
Creatinine serum level (measured)....543
Current opioid pharmacotherapy treatment program indicator 546
Current smoking status 548
CVD drug therapy—condition....550
Date accuracy indicator 552
Date C-reactive protein level measured....558
Date creatine kinase MB isoenzyme measured....559
Date creatinine serum level measured 560
Date health-care incident occurred....561
Date of acute coronary syndrome related clinical event 563
Date of birth 564
Date of cessation of treatment episode for alcohol and other drugs 569

Date of change to qualification status 571
Date of commencement of treatment episode for alcohol and other drugs 572
Date of completion of last previous pregnancy 574
Date of coronary artery bypass graft....................576
Date of death....................577
Date of diagnosis 579
Date of diagnosis of cancer 580
Date of diagnosis of first recurrence....................582
Date of diagnosis of first recurrence as distant metastasis....................583
Date of diagnosis of first recurrence as locoregional cancer 586
Date of diagnostic cardiac catheterisation 589
Date of electrocardiogram....................590
Date of first contact 591
Date of first delivery of service 593
Date of functional stress test....................595
Date of implantable cardiac defibrillator procedure....................596
Date of intra-aortic balloon pump procedure 597
Date of intravenous fibrinolytic therapy....................598
Date of last contact 600
Date of last contact—cancer patient 602
Date of most recent stroke....................604
Date of non-invasive ventilation administration....................605
Date of onset of acute coronary syndrome symptoms 606
Date of pacemaker insertion 608
Date of primary percutaneous coronary intervention 609
Date of procedure....................610
Date of referral to rehabilitation....................612
Date of rescue percutaneous coronary intervention 613
Date of revascularisation percutaneous coronary intervention 614
Date of triage....................616
Date of ventricular ejection fraction test 618
Date patient presents 619
Date patient presents—emergency department stay 621
Date troponin measured 623

Day program attendances 624

Degree of spread of cancer 626

Department of Veterans' Affairs file number 629

Department of Veterans' Affairs patient 633

Dependency in activities of daily living—bathing 635

Dependency in activities of daily living—bed mobility 637

Dependency in activities of daily living—bladder continence 639

Dependency in activities of daily living—bowel continence 641

Dependency in activities of daily living—day-time technical nursing care requirement 643

Dependency in activities of daily living—dressing 646

Dependency in activities of daily living—eating 648

Dependency in activities of daily living—evening technical nursing care requirement 650

Dependency in activities of daily living—extra surveillance 653

Dependency in activities of daily living—infrequent technical nursing care requirement 655

Dependency in activities of daily living—mobility 658

Dependency in activities of daily living—night-time technical nursing care requirement 660

Dependency in activities of daily living—toileting 663

Dependency in activities of daily living—transferring 665

Diabetes status 667

Diabetes therapy type 671

Diagnosis related group 674

Difficulty with activities 677

Distress related to current imprisonment indicator 681

Division of General Practice number 683

Dyslipidaemia treatment indicator 684

ECG - Q waves indicator 686

Education attendance status 30 days prior to imprisonment 688

Electrocardiogram—new Q waves indicator 691

Electrocardiogram—lead V4R presence indicator 693

Electrocardiogram—ST-segment-elevation in lead V4R 695

Electrocardiogram change location 697

Electrocardiogram change type....699
Electronic communication address (person)....702
Electronic communication address (service provider organisation)....704
Electronic communication medium (person)....706
Electronic communication medium (service provider organisation)....708
Electronic communication usage code (person)....710
Emergency department arrival mode - transport....712
Emergency department clinical care commencement date....714
Emergency department clinical care commencement time....718
Emergency department date of commencement of service event....722
Emergency department episode end date....725
Emergency department episode end time....727
Emergency department physical departure date....729
Emergency department physical departure time....732
Emergency department service episode end status....734
Emergency department time of commencement of service event....736
Emergency department waiting time to admission....740
Emergency department waiting time to clinical care commencement....742
Employee expenses....744
Employment status (admitted patient)....747
Employment status—health professional....749
Employment status—public psychiatric hospital admissions....751
Environmental factor....754
Episode of residential care end date....758
Episode of residential care end mode....759
Episode of residential care start date....761
Episode of residential care start mode....762
Erectile dysfunction....763
Establishment identifier....765
Establishment number....768
Establishment sector....769
Establishment type....771
Estimated glomerular filtration rate (eGFR) recorded indicator....777
Ever been pregnant indicator....779

Ever smoked a full cigarette indicator 781
Extended leave status in registered profession....................783
Extended wait patient....................785
Extent of harm from a health-care incident....................787
Extent of participation 790
External cause 794
External cause (non-admitted patient) 796
External cause—human intent 800
Family name....................802
Fasting status 809
Feedback collection indicator 811
Feedback collection method 813
Fibrinolytic drug used 815
Fibrinolytic therapy status 816
Field of medicine—medical practitioner....................818
First day of the last menstrual period 820
First health service contact date 821
First language spoken....................823
First time in prison or juvenile detention indicator....................826
Floor/level type (person) 828
Floor/level type (service provider organisation) 830
Foot deformity 831
Foot lesion (active) 834
Foot ulcer (history) 836
Foot ulcer (current) 838
Formal community support access status....................840
Frequency consumed 6 or more standard drinks on one occasion....................842
Full-time equivalent staff (mental health)—all staff 844
Full-time equivalent staff—administrative and clerical staff....................847
Full-time equivalent staff—average 849
Full-time equivalent staff—carer consultants 852
Full-time equivalent staff—consultant psychiatrists and psychiatrists....................854
Full-time equivalent staff—consumer consultants....................856
Full-time equivalent staff—diagnostic and health professionals 858

Full-time equivalent staff—domestic and other staff....861
Full-time equivalent staff—enrolled nurses....863
Full-time equivalent staff—nurses....865
Full-time equivalent staff—occupational therapists....867
Full-time equivalent staff—other diagnostic and health professionals....869
Full-time equivalent staff—other medical officers....871
Full-time equivalent staff—other personal care staff....873
Full-time equivalent staff—psychiatry registrars and trainees....876
Full-time equivalent staff—psychologists....878
Full-time equivalent staff—registered nurses....880
Full-time equivalent staff—salaried medical officers....882
Full-time equivalent staff—social workers....885
Full-time equivalent staff—student nurses....887
Full-time equivalent staff—trainee/pupil nurses....889
Fully immunised recorded indicator....891
Functional stress ischaemic and perfusion outcome result....893
Functional stress test assessment of cardiac perfusion....895
Functional stress test element....896
Functional stress test intensity....899
Functional stress test performed indicator....901
Funding source for hospital patient....902
Funding source for hospital patient....906
Geographic remoteness—admitted patient care....910
Geographic remoteness....913
Geographical location of establishment....916
Geographical location of service delivery outlet....918
Gestational age....920
Given name sequence number....922
Given name(s)....923
Glycoprotein IIb/IIIa receptor antagonist (status)....930
Glycosylated haemoglobin level....932
Glycosylated haemoglobin level (measured)....934
Glycosylated haemoglobin measurement result recorded indicator....936
Glycosylated haemoglobin—upper limit of normal range (percentage)....938

Goal of care....................940

GP Management Plan indicator....................943

Grants to non-government organisations—accommodation services....................946

Grants to non-government organisations—advocacy services....................949

Grants to non-government organisations—community awareness/health promotion services....................951

Grants to non-government organisations—counselling services....................953

Grants to non-government organisations—independent living skills support services....................955

Grants to non-government organisations—other and unspecified mental health services....................957

Grants to non-government organisations—pre-vocational training services....................960

Grants to non-government organisations—psychosocial support services....................962

Grants to non-government organisations—recreation services....................964

Grants to non-government organisations—respite services....................966

Grants to non-government organisations—self-help support group services....................968

Gross capital expenditure (accrual accounting)—buildings and building services....................970

Gross capital expenditure (accrual accounting)—constructions....................971

Gross capital expenditure (accrual accounting)—equipment....................972

Gross capital expenditure (accrual accounting)—information technology....................973

Gross capital expenditure (accrual accounting)—intangible assets....................974

Gross capital expenditure (accrual accounting)—land....................975

Gross capital expenditure (accrual accounting)—major medical equipment....................976

Gross capital expenditure (accrual accounting)—other equipment....................977

Gross capital expenditure (accrual accounting)—transport....................979

Gross capital expenditure—computer equipment/installations....................980

Gross capital expenditure—intangible assets....................982

Gross capital expenditure—land and buildings....................984

Gross capital expenditure—major medical equipment....................986

Gross capital expenditure—other....................988

Gross capital expenditure—plant and other equipment....................990

Group session indicator....................992

Group sessions (public psychiatric, alcohol and drug hospital)—emergency and outpatient....................994

Group sessions (public psychiatric, alcohol and drug hospital)—outreach and community....................996

Group sessions—alcohol and other drug 998
Group sessions—allied health services 1000
Group sessions—community health services 1003
Group sessions—dental....1006
Group sessions—dialysis 1008
Group sessions—district nursing services....1011
Group sessions—emergency services 1014
Group sessions—endoscopy and related procedures....1016
Group sessions—mental health....1019
Group sessions—other medical/surgical/diagnostic....1021
Group sessions—other outreach services 1024
Group sessions—pathology....1027
Group sessions—pharmacy....1029
Group sessions—radiology and organ imaging....1032
Health industry relevant organisation type 1035
Health professionals attended (diabetes mellitus) 1049
Health service request received date....1052
Health service setting 1053
Heart rate....1056
Heart rhythm type 1057
Height (measured) 1059
Height (self-reported) 1064
Highest year of school completed....1067
Hip circumference (measured)....1069
Histopathological grade 1073
Hormone therapy completion date 1076
Hormone therapy start date 1079
Hospital identifier 1082
Hospital insurance status....1084
Hospital name....1086
Hours on-call (not worked) by medical practitioner....1088
Hours worked in health profession—clinical 1089
Hours worked in health profession—non-clinical 1092
Hours worked in health profession—private sector 1094

Hours worked in health profession—public sector 1097
Hours worked in health profession—total 1100
Household annual gross income range....1103
Household annual gross income range ($ 10,000 range) 1106
HPI-O 1108
Human epidermal growth factor receptor-2 test result....1111
Human epidermal growth factor receptor-2 test type 1114
Hypertension—treatment 1116
Hypoglycaemia—severe 1118
Hysterectomy indicator....1119
Immunotherapy completion date 1121
Immunotherapy start date 1123
Impairment of body function 1125
Impairment of body structure 1128
Imprisonment in the last 12 months indicator 1131
Indicator procedure 1133
Indigenous status 1138
Individual sessions (public psychiatric, alcohol and drug hospital)—emergency and outpatient....1144
Individual sessions (public psychiatric, alcohol and drug hospital)—outreach and community 1146
Individual sessions—alcohol and drug....1148
Individual sessions—allied health services....1151
Individual sessions—community health services 1153
Individual sessions—dental....1156
Individual sessions—dialysis 1158
Individual sessions—district nursing services....1161
Individual sessions—emergency services 1164
Individual sessions—endoscopy and related procedures....1167
Individual sessions—mental health 1170
Individual sessions—other medical/surgical/diagnostic 1172
Individual sessions—other outreach services....1175
Individual sessions—pathology....1178
Individual sessions—pharmacy....1181
Individual sessions—radiology and organ imaging....1183

Individual/group session indicator 1186
Infant weight, neonate, stillborn 1187
Influence of environmental factor........1189
Influenza immunisation indicator 1194
Informal carer existence indicator 1195
Initial visit indicator—diabetes mellitus........1199
Initiator of prison clinic visit........1201
Injecting drug use status 1202
Instrumented bleeding location 1204
Intended length of hospital stay........1207
Intended place of birth 1209
Intended years in health profession 1211
Intention of treatment........1213
Intention of treatment for cancer 1215
Inter-hospital contracted patient........1217
Interpreter services required 1220
Killip classification code........1224
Labour force status........1226
Labour force status 30 days prior to imprisonment........1229
Laterality of primary cancer 1232
Leave days from residential care 1236
Legal status of prison entrant........1238
Legal status of prisoner 1240
Length of employment in health profession 1242
Length of non-admitted patient emergency department service episode 1244
Length of stay 1246
Length of stay (including leave days) 1248
Length of stay (including leave days) (antenatal) 1250
Length of stay (including leave days) (postnatal) 1252
Letters of family name........1254
Letters of given name 1257
Level number identifier........1260
Level of highest non-school qualification........1262
Level of palliative care service 1266

Lifestyle counselling type 1269
Lipid-lowering therapy status 1271
Listing date for care 1273
Living arrangement 1275
Location of impairment 1277
Lot/section number (person) 1280
Lot/section number (service provider organisation) 1282
Lower limb amputation due to vascular disease 1284
Lymphovascular invasion 1286
Main language other than English spoken at home 1288
Main occupation of person 1291
Main treatment type for alcohol and other drugs 1293
Major diagnostic category 1296
Marital status 1299
Maternal medical conditions 1302
Maximum stenosis coronary artery 1304
MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator 1305
Medical indemnity payment recipient 1307
Medical indemnity claim commencement date 1309
Medical indemnity claim finalisation date 1311
Medical indemnity claim identifier 1313
Medical indemnity claim reserve size 1314
Medical indemnity claim size 1316
Medical indemnity claim state/territory identifier 1318
Medical indemnity claim status 1320
Medicare card number 1323
Medicare eligibility status 1325
Medication for mental health disorder indicator 1328
Medication type 1330
Mental health disorder indicator 1331
Mental health legal status 1333
Mental health service contact date 1336
Mental health service contact duration 1337
Mental health service contact—patient/client participation indicator 1339

Mental health service contact—session type 1341
Mental health service referral 1343
Mental health services grants to non-government organisations by non-health departments 1345
Method of birth 1346
Method of use for principal drug of concern 1348
Microalbumin level—albumin/creatinine ratio (measured) 1350
Microalbumin level—micrograms per minute (measured) 1352
Microalbumin level—milligrams per 24 hour (measured) 1354
Microalbumin level—milligrams per litre (measured) 1356
Microalbumin level—upper limit of normal range (albumin/creatinine ratio) 1358
Microalbumin level—upper limit of normal range (micrograms per minute) 1360
Microalbumin level—upper limit of normal range (milligrams per 24 hour) 1362
Microalbumin level—upper limit of normal range (milligrams per litre) 1364
Microalbumin urine test result 1366
Minutes of operating theatre time 1367
Mode of admission 1368
Mode of medical indemnity claim finalisation 1370
Mode of separation 1373
Month and year of birth 1375
Morphology of cancer 1377
Most common service delivery setting 1380
Most valid basis of diagnosis of cancer 1382
Most valid basis of diagnosis of recurrence 1385
Mother's original family name 1389
Multi-disciplinary team status 1390
Myocardial infarction (history) 1391
Name context flag 1393
Name suffix 1395
Name suffix sequence number 1397
Name title 1399
Name title sequence number 1401
Name type 1403
Name type (service provider organisation) 1406
Narrative description of injury event 1408

National standards for mental health services review status 1410
Nature of main injury (non-admitted patient) 1412
Neo-adjuvant therapy 1415
Neonatal morbidity 1417
Net capital expenditure (accrual accounting)—buildings and building services 1418
Net capital expenditure (accrual accounting)—constructions 1419
Net capital expenditure (accrual accounting)—equipment 1420
Net capital expenditure (accrual accounting)—information technology 1421
Net capital expenditure (accrual accounting)—intangible assets 1422

Episode end status 2914
Episode end time 2915
Episode start date 2916
Episode start mode 2917
Erectile dysfunction 2918
Establishment type 2919
Estimated duration 2920
Estimated glomerular filtration rate (eGFR) recorded indicator 2921
Ever been pregnant indicator 2922
Ever smoked a full cigarette indicator 2923
Expenses 2924
Extended leave status in registered profession 2925
Extended wait patient indicator 2926
Extent of environmental factor influence 2927
Extent of harm from a health-care incident 2928
Extent of impairment of body function 2929
Extent of impairment of body structure 2930
Extent of participation in a life area 2931
Extent of primary cancer 2932
External cause 2933
Family name 2934
Fasting indicator 2935
Feedback collection indicator 2936
Feedback collection method 2937

Fibrinolytic drug administered 2938
Fibrinolytic therapy status 2939
First contact date 2940
First day of the last menstrual period 2941
First language spoken....2942
First service contact date 2943
First service delivery date 2944
First time in prison or juvenile detention indicator....2945
Floor/level type....2946
Foot deformity indicator 2947
Foot lesion indicator 2948
Foot ulcer indicator 2949
Formal community support access indicator 2950
Full-time equivalent staff 2951
Fully immunised indicator 2953
Functional stress test date 2954
Functional stress test element....2955
Functional stress test performed indicator 2956
Funding eligibility indicator....2957
Geographic location....2958
Geographic remoteness 2959
Gestational age 2960
Given name 2961
Given name sequence number 2962
Glycoprotein IIb/IIIa receptor antagonist therapy status 2963
Glycosylated haemoglobin level 2964
Glycosylated haemoglobin measurement result recorded indicator....2965
Goal of care....2966
Government funding identifier....2967
GP Management Plan (MBS Item 721) indicator 2968
Gross capital expenditure 2969
Gross income....2971
Group session status 2972
Health professionals attended for diabetes mellitus....2973

Health worker type 2974
Heart rate....2975
Heart rhythm type 2976
Height 2977
High-density lipoprotein cholesterol level 2978
Highest year of school completed....2979
Hip circumference....2980
Histopathological grade 2981
Hormone therapy completion date 2982
Hormone therapy start date 2983
Hospital identifier 2984
Hospital in the home care 2985
Hospital insurance status 2986
Hospital name....2987
Hours on-call....2988
Hours worked in clinical role 2989
Hours worked in health profession 2990
Hours worked in non-clinical role 2991
Hours worked in private sector 2992
Hours worked in public sector....2993
Human epidermal growth factor receptor-2 test result....2994
Human epidermal growth factor receptor-2 test type 2995
Human intent of injury....2996
Hypertension treatment with antihypertensive medication indicator....2997
Hysterectomy indicator....2998
Identifier 2999
Identifier type 3000
Immunotherapy completion date 3001
Immunotherapy start date 3002
Implantable cardiac defibrillator procedure date....3003
Implantable cardiac defibrillator procedure time 3004
Implementation of National standards for mental health services status 3005
Imprisonment in the last 12 months indicator 3006
Independent living skills support services grants to non-government organisations....3007

Indicator procedure 3008
Indigenous status 3009
Individual service provider consulted indicator 3010
Influenza immunisation indicator 3011
Informal carer existence indicator 3012
Initial visit since diagnosis indicator 3013
Injecting drug use status 3014
Insulin start date 3015
Intended length of hospital stay 3016
Intended years in profession 3017
Intention of treatment 3018
Inter-hospital contracted patient status 3019
International postcode 3020
Interpreter service required status 3021
Intra-aortic balloon pump procedure date 3022
Intra-aortic balloon pump procedure time 3023
Intravenous fibrinolytic therapy date 3024
Intravenous fibrinolytic therapy time 3025
Ischaemic and perfusion outcome result 3026
Jobseeker status in registered profession 3027
Killip classification 3028
Labour augmentation type 3029
Labour force status 3030
Labour force status 30 days prior to imprisonment 3031
Labour induction type 3032
Labour onset type 3033
Last contact date 3034
Laterality of primary cancer 3035
Legal status of prisoner 3036
Length of employment in profession 3037
Length of stay 3038
Letters of family name 3039
Letters of given name 3040
Level number 3041

Level of difficulty with activities in a life area 3042

Level of highest non-school qualification 3043

Level of satisfaction with participation in a life area 3044

Level of service delivery 3045

Lifestyle counselling type 3046

Linkage key 3047

Lipid-lowering therapy status 3048

Listing date for care 3049

Living arrangement 3050

Location of impairment of body structure 3051

Lot/section identifier 3052

Low-density lipoprotein cholesterol level 3053

Lower limb amputation due to vascular disease 3054

Lymphovascular invasion 3055

Main activity type 3056

Main language other than English spoken at home 3057

Major diagnostic category 3058

Marital status 3059

Maternal medical condition 3060

Maximum stenosis coronary artery 3061

MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator 3062

Medical indemnity claim commencement date 3063

Medical indemnity claim finalisation date 3064

Medical indemnity claim finalisation mode 3065

Medical indemnity claim identifier 3066

Medical indemnity claim size 3067

Medical indemnity claim status 3068

Medical indemnity payment recipient type 3069

Medication for mental health disorder indicator 3070

Medication type 3071

Melanoma thickness 3072

Mental health disorder indicator 3073

Mental health legal status 3074

Mental health service duration 3075

Mental health service referral indicator 3076
Mental health services grants to non-government organisations from non-health departments 3077
Method of drug use....3078
Microalbumin level 3079
Microalbumin urine test result recorded indicator 3080
Morphology of cancer....3081
Most common service delivery setting 3082
Most recent stroke date 3083
Most valid basis of diagnosis of a cancer....3084
Mother's original family name....3085
Multi-disciplinary team status 3086
Myocardial infarction 3087
Name conditional use flag 3088
Name suffix....3089
Name suffix sequence number....3090
Name title 3091
Name title sequence number....3092
Name type....3093
Nature of impairment of body structure 3094
Nature of main injury 3095
Need for assistance with activities in a life area 3096
Neoadjuvant therapy indicator....3097
Neonatal admitted care (Non-special-care)....3098
Neonatal morbidity....3099
Net capital expenditure....3100
New/repeat service event status 3101
Non-Australian state/province....3102
Non-government non-profit indicator 3103
Non-invasive ventilation administration date....3104
Non-invasive ventilation administration time....3105
Non-school qualification indicator 3106
Non-surgical cancer treatment completion date....3107
Non-surgical cancer treatment start date....3108
Number of antenatal care visits 3109

Number of cigarettes smoked 3110
Number of cigarettes smoked after 20 weeks of pregnancy 3111
Number of cigarettes smoked first 20 weeks of pregnancy 3112
Number of clients receiving services....3113
Number of day centre attendances....3114
Number of days of hospital-in-the-home care 3115
Number of episodes of residential care....3116
Number of group session occasions of service for non-admitted patients. 3117
Number of group sessions 3118
Number of hospital transfers....3119
Number of hours staffed 3120
Number of individual session occasions of service for non-admitted patients 3121
Number of leave days....3122
Number of leave periods....3123
Number of non-admitted patient service events 3124
Number of occasions of service....3125
Number of patient days....3126
Number of positive regional lymph nodes....3127
Number of positive sentinel lymph nodes 3128
Number of pregnant prisoners....3129
Number of previous caesarean sections....3130
Number of previous pregnancies 3131
Number of prison entrants 3132
Number of prisoners released 3133
Number of psychiatric care days 3134
Number of psychiatric outpatient clinic/day program attendances....3135
Number of qualified days 3136
Number of regional lymph nodes examined 3137
Number of sentinel lymph nodes examined 3138
Number of separations 3139
Number of service contact dates 3140
Number of service contacts....3141
Number of service contacts....3142
Number of times in prison or juvenile detention 3143

Number of vaccine doses administered 3144
Nursing diagnosis 3145
Nursing intervention 3146
Occupation 3147
Occupation end date 3148
Occupation start date 3149
Oestrogen receptor assay result 3150
Operating theatre time 3151
Ophthalmological assessment outcome 3152
Ophthalmoscopy performed indicator 3153
Organisation end date 3154
Organisation identifier 3155
Organisation name 3156
Organisation start date 3157
Other and unspecified mental health services grants to non-government organisations3158
Other cancer treatment 3159
Outcome of treatment 3160
Outpatient clinic type 3161
Overdue patient status 3162
Overnight-stay admitted care 3163
Pacemaker insertion date 3164
Pacemaker insertion time 3165
Palliative care strategic plan indicator 3166
Parity 3167
Partner organisation type 3168
Patient election status 3169
Patient listing status 3170
Patient present status 3171
Patient/client participation indicator 3172
Patients/clients in residence at year end 3173
Percutaneous coronary intervention procedure type 3174
Period of residence in Australia 3175
Peripheral neuropathy indicator 3176
Peripheral vascular disease indicator 3177

Person identifier 3178
Pharmacotherapy type prescribed in hospital 3179
Pharmacotherapy type taken post discharge from hospital 3180
Physical activity sufficiency status 3181
Physical departure date....3182
Physical departure time....3183
Place of occurrence....3184
Planned hospital transfer indicator 3185
Pneumococcal disease immunisation indicator....3186
Postal delivery point identifier....3187
Postal delivery service type 3188
Postal delivery service type identifier....3189
Postpartum perineal status 3190
Pre-vocational training services grants for non-government organisations....3191
Preferred language....3192
Pregnancy completion date 3193
Pregnancy indicator 3194
Pregnancy outcome....3195
Premature cardiovascular disease family history status 3196
Presentation date....3197
Presentation time....3198
Previous opioid pharmacotherapy treatment program indicator....3199
Previous specialised treatment....3200
Primary body function or structure affected....3201
Primary incident or allegation type....3202
Primary percutaneous coronary intervention date 3203
Primary percutaneous coronary intervention time....3204
Primary site of cancer 3205
Primary tumour status 3206
Principal clinician specialty involved in health-care incident 3207
Principal diagnosis....3208
Principal field of medicine....3209
Principal role....3210
Principal source of funding 3211

Prison health clinic visit initiator 3212
Prisoner health discharge summary indicator 3213
Prisoner location 3214
Prisoner location when service provider was needed, but not utilised 3215
Procedure 3216
Procedure commencement date 3217
Proficiency in spoken English 3218
Progesterone receptor assay results 3219
Proteinuria status 3220
Psychosocial support services grants for non-government organisations 3221
Purchase of goods and services 3222
Quality accreditation/certification standard indicator 3223
Radiation dose administered 3224
Radiotherapy completion date 3225
Radiotherapy fractions administered 3226
Radiotherapy start date 3227
Radiotherapy target site 3228
Radiotherapy treatment type 3229
Ready-for-care date 3230
Reason for health clinic attendance 3231
Reason for non prescription of pharmacotherapy 3232
Reason for non-utilisation of health service 3233
Reason for readmission following acute coronary syndrome episode 3234
Reason for removal from a waiting list 3235
Recreation services grants to non-government organisations 3236
Recurrent expenditure 3237
Referral destination 3239
Referral source 3240
Referral to ophthalmologist indicator 3241
Referral to rehabilitation service date 3242
Region identifier 3243
Region name 3244
Region of first recurrence as distant metastasis 3245
Region of first recurrence as locoregional cancer 3246

Region of first recurrence of cancer 3247
Regional lymph node metastasis status 3248
Regular client indicator 3249
Regular tobacco smoking indicator 3250
Relationship to health-care service provider..3251
Renal disease therapy 3252
Rescue percutaneous coronary intervention date 3253
Rescue percutaneous coronary intervention time 3254

Acknowledgments

The METeOR and Metadata Unit of the Australian Institute of Health and Welfare receives funding from the Australian Health Minsters' Advisory Council to produce and maintain the national standards for this *National health data dictionary* (NHDD). This includes producing biennial editions of the NHDD that are endorsed by the National Health Information Standards and Statistics Committee (NHISSC), and posting NHISSC-endorsed updates to the NHDD on METeOR every 6 months.

Summary of updates to National Health Data Dictionary (NHDD) since version 15

The purpose of this document is to inform users of updates to the National Health Data Dictionary (NHDD) version 16 published August 2012. This update reflects changes to the national health data standards between 1 July 2010 and 30 April 2012. During this time ten data set specifications, twenty three data element clusters, a hundred and seventy seven data elements, one classification and twenty glossary items have been added. Other changes include the revision of twelve national minimum datasets, two data set specification, eighty three data elements, five classifications and three glossary items. As a result of these revisions, tweleve national minimum data sets, two data set specifications, ninety six data elements, five classifications and three glossary items have been superseded. Three national standards have been retired since version 15 of the NHDD was published.

These new standards have been agreed to and endorsed by the National Health Information Standards and Statistics Committee (NHISSC).

Table 1: Summary of table of updates to the NHDD since version 15

Registration status	National Minimum Data Sets	Data Set Specifications	Data element clusters	Data elements	Classifications	Glossary items
Standards (new)	0	10	23	177	1	20
Standards (revised)	12	2	0	83	5	3
Superseded	12	2	0	96	5	3
Retired	0	3	0	0	0	0

Table 2: Revised national minimum data sets

NMDS	Description of change	Data elements revised	Data elements added	Data elements removed
Admitted patient care NMDS 2011-2012	Revisions made to one data element due to version change of related classification	Area of usual residence	Nil	Nil
Admitted patient care NMDS 2012-2013	Revisions made to four data elements due to version change of related classification and changes in property and value domains. Thirteen new data elements added to new elective surgery waiting times cluster.	Area of usual residence Country of birth Inter-hospital contracted patient status Mental health legal status Patient funding source	Area of usual residence (SA2) Australian postcode code (address) Clinical urgency Medicare eligibility status Extended wait	Nil

NMDS	Description of change	Data elements revised	Data elements added	Data elements removed
			patient Indicator procedure Listing date for care Establishment identifier Overdue patient Record identifier Surgical specialty Waiting time at removal from elective surgery waiting list	
Admitted patient mental healthcare NMDS 2011-2012	Revisions made to one data element due to version change of related classification.	Area of usual residence	Nil	Nil
Admitted patient mental healthcare NMDS 2012-2013	Revisions of three data elements. Updates of classifications and new area of usual residence data element added.	Area of usual residence Country of birth Mental health legal status	Area of usual residence (SA2)	Nil
Admitted patient palliative care NMDS 2011-2012	Revisions made to one data element due to version change of related classification.	Area of usual residence	Nil	Nil
Admitted patient palliative care NMDS 2012-2013	Revisions made to one data element due to version change of related classification. New area of usual residence data element added.	Country of birth	Area of usual residence (SA2)	Nil
Alcohol and other drug treatment services NMDS 2011-2012	Revisions made to one data element due to version change of related classification	Area of usual residence	Nil	Nil
Alcohol and other drug treatment services NMDS 2012-2013	Revisions made to five data elements due to version change of related classification. New area of usual residence data element added. Statistical linkage key cluster has been added.	Other drug of concern Principle drug of concern Country of birth Preferred language Geographic location	Area of usual residence (SA2) Letters of family name Letters or given name Statistical linkage key 581 Date accuracy indicator	Nil

NMDS	Description of change	Data elements revised	Data elements added	Data elements removed
Community mental health care NMDS 2011-2012	Revisions made to one data element due to version change of related classification. New target population data element added.	Area of usual residence	Target population group	Nil
Community mental health care NMDS 2012-2013	Revisions made to two data elements. Eight new data elements have been added and two organisation identifier data elements have been removed.	Mental health legal status Country of birth	Ambulatory service unit identifier Ambulatory service unit name Area of usual residence (SA2) Organisation identifier Organisation name Region name Service unit cluster identifier Service unit cluster name	Establishment identifier Establishment number
Elective surgery waiting times (census data) DSS 1 January 2012-30 June 2012	Revisions have been made to two data elements and one data element has been removed.	Overdue patient status Waiting time at a census date	Nil	Extended wait patient indicator
Elective surgery waiting times (census data) 2012-2013	Revisions have been made to one data elements. Patient listing status, readiness for care data element has been added.	Indicator procedure	Patient listing status	
Elective surgery waiting times (removals data) DSS 1 January 2012-30 June 2012	Revisions have been made to three data elements and one data element has been removed.	Overdue patient status Reason for removal from elective surgery waiting list Waiting time at removal from elective surgery waiting list	Nil	Extended wait patient indicator
Elective surgery waiting times (removals data) 2012-2013	Revisions have been made to one data element.	Indicator procedure	Nil	Nil
Mental health establishments NMDS 2011-2012	Revisions made to one data element due to version change of related classification. One data element has been added.	Area of usual residence	Non-government non-profit indicator	Nil
Mental health establishments NMDS 2012-2013	One data element has been revised. Sixteen new data elements have been added including new ASGS data element.	Supported mental health housing places	Admitted patient service unit identifier Admitted patient	Nil

NMDS	Description of change	Data elements revised	Data elements added	Data elements removed
			service unit name Ambulatory service unit identifier Ambulatory service unit name Area of usual residence (SA2) Full-time equivalent staff-nurses Region name Service unit cluster identifier Service unit cluster name Hospital identifier Hospital name Organisation identifier Organisational name Number of clients receiving services Residential service unit identifier Residential service unit name	
Non-admitted patient emergency department care NMDS 2011-2012.	Revisions made to five data elements due to version change of related classifications, changes to guide for use, changes to definition and updated ASGC code.	Area of usual residence Emergency department service episode end status Emergency department episode end time Length of non-admitted patient emergency department service episode Triage category	Nil	Nil
Non-admitted patient emergency department care NMDS 2012-2013	Revisions made to nine data elements due to version change of related classifications and object class changes. New Area of usual residence data element added.	Emergency department clinical care commencement date Emergency department clinical care commencement	Area of usual residence (SA2)	Nil

NMDS	Description of change	Data elements revised	Data elements added	Data elements removed
		time Country of birth Area od usual residence Date patient presents Time patient presents Emergency department arrival mode-transport Type of visit to emergency department Emergency department waiting time to clinical care commencement		
Perinatal NMDS 2011-2012	Revisions made to one data element due to version change of ASCG code.	Area of usual residence	Nil	Nil
Perinatal NMDS 2012-2013	Revisions made to one data element due to version change of relevant classifications. New ASGS data element added and old version removed.	Country of birth	Area of usual residence (SA2)	Area of usual residence
Public hospital establishments NMDS 2011-2012	Revisions made to one data element due to version change ASCG code.	Area of usual residence	Nil	Nil
Public hospital establishments NMDS 2012-2013	One new area of usual residence data element added.	Nil	Area of usual residence (SA2)	Nil
Residential mental health care NMDS 2011-2012	Revisions made to one data element due to version change ASCG code.	Area of usual residence	Nil	Nil
Residential mental health care NMDS 2012-2013	Revisions made to one data element due to version change ASCG code. Five new data elements have been added.	Country of birth	Area of usual residence (SA2) Organisation identifier Organisation name Residential service unit identifier Residential service unit name	Nil

Table 3: Revised data set specifications

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
Cancer (clinical) DSS	Review and restructure of Cancer clinical data elements. Addition of treatment-specific data element clusters and implementation of updated classifications. Eleven data elements have been removed.	Cancer staging—M stage code Cancer staging—N stage code Cancer staging—T stage code Cancer staging—TNM stage grouping code Cancer treatment type Date of diagnosis of cancer Date of surgical treatment for cancer Histopathological grade Laterality of primary cancer Morphology of cancer Most valid basis of diagnosis of cancer Number of regional lymph nodes examined Outcome of initial treatment Primary site of cancer (ICDO-3 code) Received radiation dose Regional lymph nodes positive Staging scheme source edition number Staging scheme source Staging basis of cancer Surgical treatment procedure for cancer Systemic therapy agent name Tumour size at diagnosis (solid tumours)	Cancer staging—stage grouping other Cancer status Chemotherapy completion date Chemotherapy cycles administered Chemotherapy start date Date accuracy indicator Date of diagnosis of first recurrence as distant metastasis Date of diagnosis of first recurrence as locoregional cancer Date of last contact Hormone therapy completion date Cancer staging—stage grouping other Cancer status Chemotherapy completion date Chemotherapy cycles administered Chemotherapy start date Date accuracy indicator Date of diagnosis of first recurrence as distant metastasis Date of last contact Hormone therapy completion date	Cancer initial treatment completion date Cancer initial treatment starting date Cancer treatment—target site (ICD-10-AM) Cancer treatment—target site (ICDO-3) Date of diagnosis of first recurrence Intention of treatment for cancer Oestrogen receptor assay result Cancer initial treatment completion date Cancer initial treatment starting date Cancer treatment—target site (ICD-10-AM) Cancer treatment—target site (ICDO-3) Date of diagnosis of first recurrence

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
			Hormone therapy start date HPI-O Immunotherapy completion date Immunotherapy start date Most valid basis of diagnosis of recurrence Other cancer treatment Systemic therapy agent or protocol, eviQ Radiotherapy completion date Radiotherapy fractions administered	Intention of treatment for cancer Oestrogen receptor assay result Primary site of cancer (ICD-10-AM code) Progesterone receptor assay results Region of first recurrence Tumour thickness at diagnosis (melanoma)
			Radiotherapy start date Radiotherapy target site Radiotherapy treatment type Region of first recurrence as distant metastasis Region of first recurrence as locoregional cancer Surgery target site Systemic therapy procedure date Systemic therapy procedure Systemic therapy agent or protocol Underlying cause of death	Date of diagnosis of first recurrence Intention of treatment for cancer Oestrogen receptor assay result Primary site of cancer (ICD-10-AM code) Progesterone receptor assay results Region of first recurrence Tumour thickness at diagnosis (melanoma)

DSS	Description of change	Data elements revised	Data elements added	Data elements removed
Non-admitted patient DSS 2012-13	Revision of two data elements due to version change of related classifications. New area of usual residence data element added.	Area of usual residence Country of birth	Area of usual residence (SA2)	Nil

Table 4: New data set specifications

Name	Description
Indigenous primary healthcare DSS	The Indigenous primary healthcare DSS is primarily designed to support the collection of aggregate information from Indigenous-specific primary health care services.
Medical indemnity DSS	The Medical indemnity DSS describes the data items and standardised data outputs for medical indemnity claims for the medical indemnity national collection. These claims fit into two categories: • Actual claims • Potential claims.
Perinatal DSS	The Perinatal DSS collects data on all births, both live and stillborn, of at least 20 weeks gestation or 400 grams birth weight, in Australian hospitals.
Prison clinic contact DSS	The Prison clinic contact DSS describes data on the visits by prisoners to the prison clinic during the National Prisoner Health Census reporting period.
Prison entrants DSS	The Prison entrants DSS describes the data on all persons aged 18 years and over entering prison system during the National Prisoner Health Census reporting period.
Prison establishments DSS	The Prison establishments DSS describes the data on services provided in prison health clinics.
Prisoner health DSS	The Prisoner health DSS describes data collected from all private and public prisons throughout Australia on prison entrants, prisoners who visit a prison clinic, prisoners who are taking repeat medication while in custody, prison clinic services and staffing levels.
Prisoners in custody repeat medications DSS	The Prisoners in custody repeat medication DSS includes all prescribed medications administered on one day during the National Prisoner Health Census period and depot medications.
Public hospital establishment address DSS	The Public hospital establishment address details DSS is used to collect information pertaining to the address of the hospital establishments reported in the Public hospital establishments NMDS.
Radiotherapy waiting times DSS	The Radiotherapy waiting times DSS describes the information collected for two time periods in the treatment pathway for radiotherapy services in Australia. This includes: • The time between the date a patient's first referral is received at a particular establishment by a radiation oncologist to the date of the patient's first consultation at that establishment with a radiation oncologist; and • The time between the patient's ready-for-care date and the date of the first megavoltage external beam radiotherapy treatment

Table 5: New data clusters

Name	Description
Audit score of risky alcohol consumption cluster	The Audit score of risky alcohol consumption cluster provides a score on the World Health Organization's Alcohol Use Disorders Identification Test (AUDIT) screening instrument. It comprises of three data elements which record: • The frequency of alcohol consumption; • The number of standard drinks consumed on a typical day when drinking; and • Frequency of consuming six or more standard drinks on one occasion.
Chemotherapy for cancer cluster	The Chemotherapy for cancer cluster consists of data elements recommend for collection best practice when the patient is administered chemotherapy as part of the initial course of treatment for cancer. It includes information on: • The chemotherapy agent or protocol; • The number of cycles administered; and • The start and finish dates of treatment.
Chronic condition cluster	The Chronic condition cluster determines the number of prison entrants who have ever been told that they have arthritis, asthma, cancer, cardiovascular disease or diabetes and the number of prison entrants who currently have at least one of the se chronic conditions.
Elective surgery waiting times cluster	The Elective surgery waiting time's cluster measures patients on the elective surgery waiting lists managed by public acute hospitals. This will include public patients treated in public hospitals and may include public patients treated in private hospitals.
Full- time equivalent prison staff cluster	This Full-time equivalent prison staff cluster determines the number of full-time equivalent health staff working within a prison. It comprises of two components: • Number of full time equivalent staff, total number • Health worker type, occupation code
Health service non- utilisation cluster	The Health service non-utilisation cluster is used to determine the non-utilisation of health service in the community and in prison by prison entrants in the last 12 months.
Health service utilisation cluster	The Health service utilisation cluster is used to determine the utilisation of health services in the community and in prison by prison entrants in the last 12 months and gain a better understanding of the health seeking behaviours of prison entrants.
Hormone therapy for cancer cluster	The Hormone therapy for cancer cluster consists of data elements recommended for collection as best practice when the patient is administered hormone therapy as part of the initial course of treatment for cancer. The cluster collects information on the hormone therapy agent or protocol and the start and finish dates of treatment.
Hospital transfer cluster	The Hospital transfer cluster determines the number of planned and unplanned transfers between prison and a community-based hospital during the National Prisoner Health Census period.
Immunotherapy for cancer cluster	The Immunotherapy for cancer cluster consists of data elements recommended for collection as best practice when the patient is administered immunotherapy as part of the initial course of treatment for cancer. The cluster collects information on the immunotherapy agent or protocol and the start and finish dates of treatment.
Incarceration history cluster	The Incarceration history cluster provides information on the total number of times a prison entrant has been in custody in a juvenile detention centre or a prison. It is determined through two components that record: • The type of corrective services facility; and • The number of times in prison or juvenile detention.
Non- school qualification cluster	The Non-school qualification cluster determines whether a person has a non-school qualification and if so the level of that qualification. It is determined through two components that record: • The non-school qualification indicator ; and • The level of highest non-school qualification

Name	Description
Opioid pharmacotherapy treatment cluster	The Opioid pharmacotherapy treatment cluster is used to determine the number of prison entrants who have been on, or are currently on, an opioid pharmacotherapy treatment program and the type of opioid pharmacotherapy treatment program a prison entrant has been on or is on currently.
Pregnancy status cluster	The Pregnancy status cluster consists of data elements that determine whether a female prison entrant has ever been pregnant and if so, the age of her first pregnancy.
Prisoner health discharge summary cluster	The Prisoner health discharge summary cluster determines the number of sentenced and remand prisoners that were released from a prison during the National Prisoner Health Census period and the number of sentenced and remand prisoners who have a health related discharge summary on file at the time of their release.
Radiotherapy for cancer cluster	The Radiotherapy for cancer cluster collects information on the radiotherapy type, dose, fractions, target site and the start and finish dates for each course of treatment.
Sex of prison entrant cluster	The Sex of prison entrant's cluster describes the number of male and female prison entrants into a prison during the National Prisoner Health Census period.
Smoking status cluster	The Smoking status cluster determines the history and current smoking status of a person. It comprises four components: • Ever smoked a full cigarette indicator; • Tobacco smoking start age; • Current smoking status indicator; and • Tobacco smoking frequency.
Statistical linkage key 581 cluster	The Statistical linkage key 581 cluster facilitates the bringing together of data from different sources to gain a greater understanding of a situation or individual from the combined (or linked) dataset.
Substances used illicitly cluster	The Substances used illicitly cluster captures information on whether a person had possessed an illegal substance, or used a substance in an illegal manner, and the type of substance used illicitly.
Surgery for cancer cluster	The Surgery for cancer cluster captures information on cancer-directed surgery performed as part of the initial course of treatment for cancer.
Systematic therapy procedure for cancer cluster	The Systematic therapy procedure for cancer cluster consists of data elements recommended for collection as best practice when the patient receives a systemic therapy procedure as part of the initial course of treatment for cancer.
Vaccines administered cluster	The Vaccines administered cluster comprises of data elements that describe the number of hepatitis B, human papillomavirus (HPV) and meningococcal vaccines administered to prisoners during the National Prisoner Health Census period

Table 6: New data elements

Short name	Technical name
ACCHO/AMS service provider type	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service provider type, occupation code (ANZSCO 1st edition) N[NNN]{NN}
ACCHO/AMS visitation frequency	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medial service visitation frequency, code N
Additional body function or structure of patient affected	Patient—additional body function or structure affected, body function or structure code N[N]
Additional clinician speciality involved in health-care incident	Health-care incident—additional clinician speciality involved in health-care incident, clinical specialities code N[N]
Additional incident or allegation type	Medical indemnity claim—additional incident or allegation type, health care code NN[N]

Short name	Technical name
Admitted patient service unit identifier	Specialised mental health service—admitted patient service unit identifier, XXXXXX
Admitted patient service unit name	Specialised mental health service—admitted patient service unit name, Text XXX[(97)]
Alcohol consumption frequency	Person—alcohol consumption frequency, AUDIT alcohol consumption frequency code
Alcohol consumption status recorded indicator	Person—alcohol consumption status recorded indicator, yes/ no code N
Ambulatory service unit identifier	Specialised mental health service—ambulatory service unit identifier, XXXXXX
Antenatal care visits	Female—number of antenatal care visits, total N[N]
At risk of suicide or self-harm	Prison entrant—at risk of suicide or self-harm indicator, yes/ no code N
Australian state/ territory identifier of address	Address—Australian state/ territory identifier, code AA[A]
Birth weight	Birth—birth weight, code N
Birth weight recorded indicator	Person—birth weight recorded indicator, yes/ no code N
Blood pressure measurement result less than or equal to 130/ 80 mmHg indicator	Person—blood pressure measurement result less than or equal to 130/ 80 mmHg indicator, yes/ no code N
Blood pressure measurement result recorded indicator	Person—blood pressure measurement result recorded indicator, yes/ no code N
Blow to the head indicator	Person—blow to the head indicator, yes/ no/ not stated/ inadequately described code N
Body mass index recorded indicator	Person—body mass index recorded indicator, yes/ no code N
Cancer staging- M stage code	Person with cancer—distant metastasis status, M stage (UICC TNM Classification of Malignant Tumours, 7th edition) code X[XX]
Cancer staging- stage group other	Person with cancer—extent of primary cancer, stage grouping other, code X[XXXXX]
Cancer status	Patient—cancer status, code N
Cardiovascular disease recorded indicator	Person—cardiovascular disease recorded indicator, yes/ no code N
Care type, derived subacute	Non-admitted patient service event—care type, subacute (derived) code N
Carer responsibility indicator	Person—Carer responsibility indicator, yes/ no/ not stated/ inadequately described, code N
Cervical screening	Female—cervical screening indicator, yes/ no/ not stated/ inadequately described
Chemotherapy completion date	Cancer treatment—chemotherapy completion date, DDMMYYYY
Chemotherapy cycles administered	Cancer treatment—chemotherapy cycles administered
Chemotherapy start date	Cancer treatment—chemotherapy start date, DDMMYYYY
Chronic condition indicator	Person—chronic condition indicator, yes/ no code N
Chronic obstructive pulmonary disease recorded indicator	Person—chronic obstructive pulmonary disease recorded indicator, yes/ no code N
Class action indicator	Medical indemnity claim management episode—class action indicator, yes/ no code N
Clinical emergency indicator	Patient—clinical emergency indicator, yes/no code N
Clinical service context	Health-care incident—clinical service context, code N
Clinical service context text	Health-care incident—clinical context, text X[X (39)]
Current opioid pharmacotherapy	Person—current opioid pharmacotherapy treatment program indicator, yes/ no code

Short name	Technical name
treatment program indicator	N
Current smoking status	Person—current smoking status indicator, yes/ no/ not stated/ inadequately described code N
Date health-care incident occurred	Health-care incident—date health-care incident occurred, DDMMYYYY
Date of diagnosis of first recurrence as distant metastasis	Patient—diagnosis of first recurrence as distant metastasis, DDMMYYYY
Date of diagnosis of first recurrence as loco regional cancer	Patient—diagnosis date of first recurrence as locoregional cancer, DDMMYYYY
Date of last contact—cancer patient	Patient—date of last contact, DDMMYYYY
Date patient presents—emergency department	Emergency department stay—presentation date, DDMMYYYY
Distress related to current imprisonment indicator	Prison entrant—distress related to current imprisonment indicator, yes/ no/ not applicable code N
Education attendance status 30 days prior to imprisonment	Prison entrant—education attendance status 30 days prior to imprisonment, education attendance status code N
Estimated glomerular filtration rate (eGFR) recorded indicator	Person—estimated glomerular filtration rate (eGFR) recorded indicator, yes/ no code N
Ever smoked a full cigarette indicator	Person—ever smoked a full cigarette indicator, yes/ no/ not stated/ inadequately described code N
Extent of harm from a health-care incident	Patient—extent of harm from a health-care incident, code N[N]
First health service contact date	Health service event—first service contact date, DDMMYYYY
First time in prison or juvenile detention indicator	Prison entrant—first time in prison or juvenile detention indicator, yes/ no code N
Frequency consumed 6 or more standard drinks on one occasion	Person—consumption of 6 or more standard drinks on one occasion, AUDIT consumption of 6 or more standard drinks code N
Full time equivalent staff- nurses	Establishment—full-time equivalent staff (paid) (nurses), average NNNN.NN
Fully immunised recorded indicator	Child—fully immunised recorded indicator, yes/ no code N
Funding source for hospital patient	Episode of care—source of funding, patient funding source code NN
Geographic remoteness—admitted patient care	Establishment—geographic remoteness, admitted patient care remoteness classification (ASGC-RA)N
Geographic remoteness	Health-care incident—geographic remoteness, remoteness classification (ASGC-RA)N
Glycosylated haemoglobin level	Person—glycosylated haemoglobin level, code N
Glycosylated haemoglobin measurement result recorded indicator	Person—glycosylated haemoglobin measurement result recorded indicator, yes/ no code N
GP management plan indicator	Person—GP management plan (MBS Item 721) indicator, yes/ no code N
Group session indicator	Non-admitted patient service event—group session indicator, yes/ no code N
Health service request received date	Health service event—service request date, DDMMYYYY
Health service setting	Health- care incident—service delivery setting, health service setting code N[N}
Highest yeah of school completed	Person—highest level of school completed, code N
Hormone therapy completion date	Cancer treatment—hormone therapy completion date, DDMMYYYY
Hormone therapy start date	Cancer treatment—hormone therapy start date, DDMMYYYY

Short name	Technical name
Hospital identifier	Hospital—hospital identifier, XXXXX
Hospital name	Hospital—hospital name, text XXX[X (97)]
HPI-O	Healthcare provider—organisation identifier, N(16)
Hysterectomy indicator	Female—hysterectomy indicator, yes/ no code N
Immunotherapy completion date	Cancer treatment—immunotherapy completion date, DDMMYYYY
Immunotherapy start date	Cancer treatment—immunotherapy start date, DDMMYYYY
Imprisonment in the last 12 months indicator	Prison entrant—imprisonment in the last 12 months indicator, yes/ no code N
Influenza immunisation indicator	Person—influenza immunisation indicator, yes/ no code N
Initiator of prison clinic visit	Health service event—prison health clinic visit initiator, code N
Intention of treatment	Patient—intention of treatment, code N
Labour force status 30 days prior to imprisonment	Prison entrant—labour force status 30 days prior to imprisonment, code N
Legal status of prison entrant	Prison entrant—legal status of prisoner, code N
Legal status of prisoner	Person—legal status of a prisoner, as represented by a code N
Letters of family name	Person—letters of family name, text XXX
Letters of given name	Person—letters of given name, text XXX
Letters of highest non- school qualification	Person—level of highest non- school qualification, code N
MBS health assessment for Aboriginal and Torres Strait Islander people (MBS Item 715) indicator	Person—MBS health assessment for Aboriginal and Torres Strait Islander people (MBS Item 715) indicator, yes/ no code N
Medical indemnity claim commencement date	Medical indemnity claim—medical indemnity claim commencement date, DDMMYYYY
Medical indemnity claim finalisation	Medical indemnity claim—medical indemnity claim finalisation mode, code N[N]
Medical indemnity claim finalisation date	Medical indemnity claim management episode—medical indemnity claim finalisation date, DDMMYYYY
Medical indemnity claim identifier	Medical indemnity claim—medical indemnity claim identifier, XXXXXX[X(14)]
Medical indemnity claim reserve size	Medical indemnity claim management episode—reserve size, range code N[N]
Medical indemnity claim size	Medical indemnity claim—medical indemnity claim size, code N[N]
Medical indemnity claim state territory identifier	Medical indemnity claim management episode—Australian state/ territory, code N
Medical indemnity claim status	Medical indemnity claim—medical indemnity claim status, code NN
Medical indemnity payment recipient	Medical indemnity claim management episode—medical indemnity payment recipient type, code N
Medication for mental health disorder indicator	Person—medication for mental health disorder indicator, yes/ no code N
Medication type	Person—medication type, medication type (ATC/ DDD) code A [{NN} AA {NN}]
Mental health disorder indicator	Person—mental health disorder indicator, yes/ no code N
Mental health service referral	Prison entrant—mental health service referral, yes/ no/ not stated/ inadequately described
Microalbumin urine test result	Person—microalbumin urine test result
Most valid basis of diagnosis of	Person with cancer-—most valid basis of diagnosis of the first recurrence, code N

Short name	Technical name
recurrence	
Non- government non- profit indicator	Specialised mental health service—non government non- profit indicator, yes/ no code N
Non- school qualification indicator	Person—non- school qualification indicator, yes/ no/ not stated/ inadequately described code N
Number of clients receiving services	Specialised mental health service—number of clients receiving services, total NNNNNN
Number of full- time equivalent	Establishment (prison)—full- time equivalent staff, total number N[N]
Number of hospital transfers	Establishment (prison)—number of hospital transfers, number N[NN]
Number of pregnant prisoners	Establishment (prison)—number of pregnant prisoners, number N[NN]
Number of prison entrants	Establishment (prison)—number of prison entrants, number N[NN]
Number of prisoners released	Establishment (prison)—number of prisoners released, number N[NN]
Number of service contacts	Specialised mental health service—number of service contacts, Total NNNNNN
Organisation identifier	Specialised mental health service organisation—organisation identifier, XXXX
Organisation name	Specialised mental health service organisation—organisation name, Text XXX[X(97)]
Other cancer treatment	Cancer treatment—other cancer treatment, text [X(150)]
Outpatient clinic type—non-admitted patient	Non-admitted patient service event—outpatient clinic type, code N[N]
Patient relationship to health-care service provider	Patient—relationship to health-care provider, code N
Planned hospital transfer indicator	Establishment (prison)—planned hospital transfer indicator, yes/ no code N
Pneumococcal disease immunisation indicator	Person—pneumococcal disease immunisation indicator, yes/ no code N
Previous opioid pharmacotherapy treatment program indicator	Person—previous opioid pharmacotherapy program indicator, yes/ no code N
Primary body function or structure of patient affected	Patient—primary body function or structure affected, body function or structure code NN
Primary incident or allegation type	Medical indemnity claim—primary incident or allegation type, health-care code NN[N]
Principal clinician speciality involved in the health- care incident	Health-care incident—principal clinician speciality involved in health- care incident, clinical specialities code N[N]
Principle diagnosis—patient	Patient—principle diagnosis, (ICD-10AM 7th edn) ANN{.N[N]}
Principle source of funding	Non-admitted patient service event—principle source of funding, code NN
Prison entrant age at first detention	Prison entrant—age at first detention, total years NN
Prison entrant number of times in prison or juvenile detention	Prison entrant—number of times in prison or juvenile detention, total number N[N]
Prison establishment identifier	Establishment (prison)—organisation identifier, NNN
Prison health worker type	Establishment (prison)—health worker type, occupation code (ANZSCO 1st edition) N[NNN] {NN}
Prisoner health discharge summary indicator	Person—prisoner health discharge summary indicator, yes/ no code N
Prisoner location when service provider utilised	Health service event—prisoner location, code N
Prisoner location when service provider was needed, but not	Health service event—prisoner location when service provider was needed, but not utilised, prisoner location code N

Short name	Technical name
utilised	
Radio therapy fractions administered	Cancer treatment—radiotherapy fractions administered, total fractions N[N
Radio therapy treatment type	Cancer treatment—radiotherapy treatment type, code N[N]
Radiotherapy completion date	Cancer treatment—radiotherapy completion date, DDMMYYYY
Radiotherapy start date—cancer treament	Cancer treatment—radiotherapy start date, DDMMYYYY
Radiotherapy start date	Patient—radiotherapy start date, DDMMYYYY
Radiotherapy target site	Cancer treatment—radiotherapy target site, code N[N]
Ready-for-care date	Patient—ready-for-care date, DDMMYYYY
Reason for health clinic attendance	Person—reason for health clinic attendance, code NN
Reason for non- utilisation of health service	Prison entrant—reason for non- utilisation of health service, code NN
Record identifier	Record—identifier, X[X(14)]
Region name	Establishment—region name, Text XXX[X(57)]
Region of first recurrence as distant metastasis	Person with cancer—region of first recurrence as distant metastasis, topography code (ICD-O-3) ANN.N
Region of first recurrence as locoregional cancer	Person with cancer—region of first recurrence as locoregional cancer, topography code (ICD-O-3)ANN.N
Regular client indicator	Person—regular client indicator, yes/ no code N
Reserve placement date	Medical indemnity claim management episode-—reserve placement date, DDMMYYYY
Residential service unit identifier	Specialised mental health service—residential service unit identifier, XXXXXX
Residential service unit name	Specialised mental health service—residential service unit name, text XXX[(97)]
Secondary complex name	Address—secondary complex name, text X[50]
Self-harm ideation in the last 12 months	Person—self harm ideation in the last 12 months, yes/ no/ not stated/ inadequately described code N
Self-harm indicator	Person—self- harm indicator, yes/ no code N
Service delivery setting	Non-admitted patient service event—service delivery setting, code N
Service event date	Non-admitted patient service event—service date, DDMMYYYY
Service provider consulted indicator	Prison entrant—individual service provider consulted indicator, yes/ no code N
Service provider needed but not utilised indicator	Prison entrant—service provider needed but not utilised indicator
Service request received	Non-admitted patient service event—service request received date, DDMMYYYY
Service request source	Non-admitted patient service event—service request source, code N.N
Service unit cluster identifier	Establishment—service unit cluster identifier, XXXXX
Service unit cluster name	Establishment—service unit cluster name, text XXX[X(97)]
Smoking status recorded indicator	Person—smoking status recorded indicator, yes/ no code N
Specific chronic condition indicator	Person—specific chronic condition indicator, yes/ no code N
Statistical area level code	Address—statistical area, level 2 (SA2) code (ASGS 2011) N(9)
Statistical linkage key 581	Record—linkage key, code 581 XXXXXDDMMYYYYN
Substance used illicitly indicator	Person—substance used illicitly indicator, yes/ no/ not stated/ inadequately described code N

Short name	Technical name
Surgery target site	Cancer treatment—surgery target site, topography code (ICD-O-3) ANN.N
Surgical procedure date	Cancer treatment—surgical procedure date, DDMMYYY
Systemic therapy agent or protocol, eviQ	Cancer treatment—systemic therapy agent or protocol, eviQ protocol identifier, NNNNNN
Systemic therapy procedure	Cancer treatment—systemic therapy procedure, code N[N]
Systemic therapy procedure date	Cancer treatment—systemic therapy procedure date, DDMMYYYY
Team care arrangement (MBS Item 723) indicator	Person—team care arrangement (MBS Item 723) indicator
Time patient presents	Emergency department stay—presentation time, hhmm
Tobacco smoking frequency	Person—tobacco smoking frequency, current tobacco smoking frequency code N
Tobacco smoking start age	Person—tobacco smoking start age, total years N[NN]
Transgender	Person—transgender indicator, code
Type of chronic condition	Person—type of chronic condition, code N
Type of compensatory payment to other party	Medical indemnity claim—type of compensatory payment to other party, code N[N]
Type of compensatory payment to patient	Medical indemnity claim—type of compensatory payment to patient, code N[N]
Type of corrective services facility	Prison entrant—type of corrective services facility, code N
Type of opioid pharmacotherapy treatment	Person—type of opioid pharmacotherapy treatment, code N
Type of service provider consulted	Health service event—type of service provider consulted, occupation code (ANZSCO 1st edition) N[NNN] {NN}
Type of service provider consulted (prison entrant)	Prison entrant—type of service consulted, occupation code (ANZSCO 1st edition) N [NNN] {NN}
Type of service provider needed but not utilised	Prison entrant—type of service provider needed but not utilised, occupation code (ANZSCO 1st edition) N[NNN]{NN}
Type of substance used illicitly	Person—type of substance used illicitly, drug of concern (ASCDC 2000 extended) code NNNN
Type of vaccine administered	Establishment (prison)—type of vaccine administered, vaccine type, code N

Table 7: Revised data elements

Short name	Technical name	Description of change
Address site name	Address—address site name, text X[50]	Changes have been made to data element definition. Value domain has been increased form text X[30] to text X[50]. Guide for use has been updated.
Area of usual residence (SA2)	Person—area of usual residence, statistical area level 2 (SA2) code (ASGS 2011) N(9)	Revisions are a result of the release of the 2011 version of Australian Statistical Geography Standard extended.
Area of usual residence	Person—area of usual residence, geographical location code (ASGC 2011) NNNN	Revisions are a result of the release of the 2011 version of Australian Statistical Geography Classification.
Australian postcode (address)	Address—Australian postcode, code (Postcode data file) [NNNN]	Changes have been made to the data element definition. Guide for use has been updated.

Short name	Technical name	Description of change
Cancer staging scheme source edition number	Cancer staging—cancer staging scheme source edition number, code N[N]	Changes have been made to the data element definition and the code set for the value domain. Guide for use has been updated.
Cancer staging- M stage code	Person with cancer—distant metastasis status, M stage (UICC TNM Classification of Malignant Tumours, 7th edition) code X[XX]	Revisions are a result of the release of the 7th edition UICC TNM classification of Malignant tumours.
Cancer staging- N stage code	Person with cancer—regional lymph node metastasis status, N stage (UICC TNM Classification of Malignant Tumours, 7th edition) code X[XX]	Revisions are a result of the release of the 7th edition UICC TNM classification of Malignant tumours.
Cancer staging- T stage code	Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 7th edition) code X[XXX]	Revisions are a result of the release of the 7th edition UICC TNM classification of Malignant tumours.
Cancer staging- TNM grouping code	Person with cancer—extent of primary cancer, TNM stage (UICC TNM Classification of Malignant Tumours, 7th edition) code X[XX]	Revisions are a result of the release of the 7th edition UICC TNM classification of Malignant tumours.
Cancer treatment type	Cancer treatment—cancer treatment type, code N[N]	Changes have been made to the data element definition. Value domain codes have been revised and supplementary values added. Guide for use has been updated.
Country of birth	Person—country of birth, code (SACC 2011) NNNN	Revisions are a result of the release of the 2011 version of Standard Australian Classification of Countries.
Country identifier	Person (address) — country identifier, code (SACC 2011) NNNN	Revisions are a result of the release of the Standard Australian Classification of Countries 2011. Short name has also been changed.
Complex road name	Address— complex road name, text X[45]	Value domain has increased text field from X[30] to X[45]. Changes made to property and object class. Guide for use has been updated.
Complex road number 1	Address—complex road number 1, road number X[6]	Value domain has decreased text field from X[12] to X[6]. Changes made to property and object class. Guide for use has been updated.
Complex road number 2	Address—complex road number 2, road number X[6]	Value domain has decreased text field from X[12] to X[6]. Changes made to property and object class. Guide for use has been updated.
Complex road type	Address—complex road type, code AA[AA	Changes made to property and object class. Value domain codes have been changed and extended. Guide for use has been updated with changes.
Date of diagnosis of cancer	Patient—diagnosis of cancer, DDMMYYYY	Changes have been made to the object class. Guide for use has been updated.
Date of triage	Non—admitted patient emergency department service episode— triage date ,DDMMYYYY	Changes have been made to data element definition and comments have been added to the guide for use.
Emergency department arrival mode- transport	Emergency department stay— transport mode (arrival), code N	Changes have been made to the data element concept.

Short name	Technical name	Description of change
Emergency department clinical care commencement time	Non-admitted patient emergency department service episode—clinical care commencement time, hhmm	Guide for use has been updated.
Emergency department of clinical care commencement date	Non-admitted patient emergency department service episode—clinical care commencement date, DDMMYYYY	Guide for use has been updated.
Emergency department departure date	Emergency department stay— physical departure date, DDMMYYYY	Guide for use and collection method has been updated.
Emergency department departure time	Emergency department stay—physical departure time, hhmm	Guide for use and collection method has been updated.
Emergency department episode end date	Non- admitted patient emergency department service episode—clinical care commencement day, DDMMYYYY	Guide for use has been updated.
Emergency department episode end time	Non- admitted patient emergency department service episode—episode end time, hhmm	Guide for use has been updated.
Emergency department service episode end status	Non- admitted patient emergency department service episode—episode end status, code N	Context has been added to data element.
Episode of residential care end date	Episode of residential care—episode end date, DDMMYYYY	Changes have been made to the data element definition.
Episode of residential care end mode	Episode of residential care—episode end mode, code N	Changes have been made to the data element definition. Value domain has been revised and guide for use has been updated.
Episode of residential care start date	Episode of residential care—episode start date, DDMMYYYY	Changes have been made to the data element definition.
Episode of residential care start mode	Episode of residential care—episode start mode, code N	Changes have been made to the data element definition. Value domain has been revised and guide for use has been updated.
First language spoken	Person—first language spoken, code (ASCL 2011) NN[NN]	Revisions are a result of the release of the 2011 Australian Standard Classification of Languages
Geographical location of service delivery outlet	Service delivery outlet—geographic location code (ASGC 2011) NNNNN	Revisions are a result of the release of the 2011 version of Australian Statistical Geography Classification.
Grants to non- government organisations- accommodation services	Specialised mental health service organisation—accommodation services grants to non- government organisations, total Australian currency N[N(8)]	Changes have been made to the data element definition and guide for use has been updated.
Histopathological grade	Person with cancer—histopathological grade, code N	Value domain has had code 5, 6, 7 and 8 removed. Guide for use has been updated.
Inter- hospital contracted patient	Episode of care— inter- hospital patient status, code N	Value domain has had code 4 and 5 added. Guide for use has been updated.
Indicator procedure	Elective care waiting list episode—indicator procedure , code NN	Changes made to the value domain and guide for use has been updated.
Laterality of primary cancer	Person with cancer—laterality of primary cancer, code [N]	Guide for use has included the valid international Classification of Diseases for Oncology values for paired organs and structures.

Short name	Technical name	Description of change
Level number identifier	Address—level number, identifier X[XXXX]	Changes have been made to the data element definition. Value domain has been changed from [NNNA] to X [XXXX]. Guide for use has been updated.
Leave days form residential care	Episode of residential care—number of leave days, total N[NN]	Guide for use has been updated..
Length of non-admitted patient emergency department service episode	Non- admitted patient emergency department service episode—service episode length, total minutes NNNNN	Context has been added to data element.
Main language other than English spoken at home	Person—main language other than English spoken at home, code (ASCL 2011) NN{NN}	Revisions are a result of the release of the 2011 Australian Standard Classification of Languages.
Medicare eligibility status	Person—eligibility status, Medicare code N	Additional information added to collection methods in relation to the primary method used for Medicare eligibility status.
Mental health legal status	Episode of care—mental health legal status, code N	Value domain code 3- Not permitted to be reported under legislative arrangements in the jurisdiction, has been replaced by code 9- Not reported/ unknown.
Morphology of cancer	Person with cancer—morphology of cancer, code (ICD-O-3) NNNN/ N	Changes have been made to the data element definition. Value domain has been revised to include the 5th digit behaviour code. Guide for use has been updated.
Most valid basis of diagnosis of cancer	Person with cancer—most valid basis of diagnosis of a cancer, code N	Revisions have been made to the data element definition and guide for use has been updated.
Number of episodes of residential care	Episode of residential care—number of episodes of residential care, total NNNN	Revisions have been made to the value domain and guide for use has been updated.
Number of regional lymph nodes examined	Person with cancer—number of regional lymph nodes examined, total N[N]	Changes made to the data element definition. Value domain has been changed to not stated/ inadequately described. Guide for use has been updated.
Outcome of treatment	Cancer treatment—outcome of treatment, code N.N	Revisions have been made to the value domain with supplementary values added. Guide for use has been updated.
Other drug of concern	Episode of treatment for alcohol and other drugs—drug of concern (other), ASDC 2011 extended) code NNNN	Revisions are a result of the release of the 2011 version of Australian Standard Drug Classification extended.
Overdue patient	Elective surgery waiting list episode—overdue patient status, code N	Guide for use has been updated.
Preferred language	Person—preferred language, code (ASCL 2011) NN[NN]	Revisions are a result of the release of the 2011 Australian Standard Classification of Languages.
Primary site of cancer (ICD-O-3 code)	Person with cancer—primary site of cancer, topography code (ICD-O-3) ANN.N	Changes have been made to the data element definition. Value domain maximum character length has increased to 6 and guide for use has been updated.
Principle drug of concern	Episode of treatment for alcohol and other drugs—drug of concern (principle), (ASDC 2011 extended) code NNNN	Revisions are a result of the release of the 2011 version of Australian Standard Drug Classification extended.

Short name	Technical name	Description of change
Radiation does administered	Cancer treatment—radiation dose administered, total Gray N[NN.NN]	Data element has been changed from dose received to dose administered. Changes have been made to the value domain and guide for use has been updated.
Reason for removal from elective surgery waiting list	Elective surgery waiting list episode—reason for removal form a waiting list, code N	Revisions have been made to the value domain.
Referral destination to further care (from specialised mental health residential care)	Episode of residential care—referral destination (mental health care), code N	Changes have been made to the object class.
Regional lymph nodes positive	Person with cancer—number of positive lymph nodes, total N[N]	Changes have been made to the data element definition. Value domain code has been changed and guide for use has been updated.
Road name	Address—road name, text X [45]	Changes made to property and object class. Value domain codes have been changed and extended. Guide for use has been updated.
Road number 1	Address—road number 1, road number X[6]	Changes made to property and object class. Value domain codes have been changed and decreased. Guide for use has been updated.
Road number 2	Address—road number 2, road number X[6]	Changes made to property and object class. Value domain codes have been changed and decreased. Guide for use has been updated.
Road type	Address—road type, code AA[AA]	Changes have been made to the property and object class. Value domain has been extended. Guide for use has been updated.
Service delivery mode	Non-admitted patient service event—service delivery mode, code N	Changes have been made to the data element definition. Value domain has been revised and changes have been made to the collection methods.
Specialised mental health service target population	Specialised mental health service—target population group code N	Value domain has been revised to include code 5- youth. Guide for use has been updated.
Staging basis of cancer	Cancer staging—staging basis of cancer, code A	Changes have been made to the data element definition. Guide for use has been updated.
Staging scheme source	Cancer staging—cancer staging scheme source, code N[N]	Changes have been made to the data element definition. Value domain has been extended and guide for use has been updated.
Sub-dwelling unit number	Address—sub-dwelling unit number, identifier [X(7)]	Changes have been made to the property and object class. Guide for use has been updated.
Suburb/town/locality name within address	Address—suburb/town/locality name, text X[46]	Changes have been made to the object class. Value domain has decreased and guide for use has been updated.
Supported mental health housing places	Specialised mental health service—supported mental health housing places, total N(6)	Value domain has been revised and guide for use has been updated.

Short name	Technical name	Description of change
Surgical procedure for cancer	Cancer treatment—surgical procedure for cancer, procedure code (ACHI 7th edn) NNNNN-NN	Changes have been made to data element definition and guide for use has been updated.
Systemic therapy agent or protocol	Cancer treatment—systemic therapy agent or protocol, text X[(149)]	Changes made to the property and guide for use has been updated.
Time of triage	Non-admitted patient emergency department service episode—triage time, hhmm	Changes have been made to the context and guide for use has been updated.
Triage category	Non-admitted patient emergency department service episode—triage category, code N	Changes have been made to the data element definitions and collection methods.
Tumour size at diagnosis (solid tumours)	Person with cancer—solid tumour size (at diagnosis), total millimetres NNN	Guide for use has been updated.
Type of visit to emergency department	Emergency department stay—type of visit to emergency department, code N	Changes have been made to the context of the data element. Value domain has been revised as has the data element concept.
Waiting list category	Elective care waiting list episode—elective care type, code N	Revisions made to the collection methods and guide for use has been updated
Waiting time at census date	Elective surgery waiting list episode—waiting time (at census date), total days N[NNN]	Revisions have been made to the comments field.
Waiting time at removal from elective surgery waiting list	Elective surgery waiting list episode—waiting time (at removal), total days N[NNN]	Revisions have been made to the comments field.

Table 8: New classifications

Name
Australian Statistical Geography Standard 2011

Table 9: Revised classifications

Name	Description of change
Australian Standard Classification of Drugs of Concern 2011	Australian Standard Classification of Drugs of Concern 2011 replaces Australian Standard Classification of Drugs of Concern 2000.
Australian Standard Classification of Language 2011	Australian Standard Classification of Languages 2011 replaces Australian Standard Classification of Languages 2005.
Australian Standard Geographical Classification 2011	Australian Standard Geographical Classification 2011 replaces Australian Standard Geographical Classification 2010.
International Union against Cancer (UICC) TNM Classification of Malignant Tumours 7th edition.	International Union against Cancer (UICC) TNM Classification of Malignant Tumours 7th edition replaces International Union against Cancer (UICC) TNM Classification of Malignant Tumours 6th edition.
Standard Australian Classification of Countries 2011	Standard Australian Classification of Countries 2011 replaces Standard Australian Classification of Countries 2008.

Name
Admitted patient mental health care service
Ambulatory mental health care service
Antenatal care visit
Chemotherapy
Class action
Course of radiotherapy treatment
Hormone therapy
Immunotherapy
Juvenile detention centre
Locality
Mental health carer workers
Mental health consumer workers
Mental health disorder
Prisoner
Radiotherapy
Reserve
Surgical procedure
Systemic therapy procedure
Transgender
Urban Centre

Table 11: Revised glossary items

Name	Description of change
Address (housing assistance)	Address (housing assistance) replaces Address, version 1, DE, NHADD, NHDAMG
Episode of residential care end	Revisions made to the glossary definition
Episode of residential care start	Revisions made to the glossary definition

Data Elements

ACCHO/AMS service provider type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service service provider type, occupation code (ANZSCO 1st edition) N[NNN]{NN}
METeOR identifier:	365480
Registration status:	Health, Standard 25/08/2011
Definition:	The type of individual service provider providing Aboriginal community controlled health organisation (ACCHO) or Aboriginal medical service (AMS) services to a prison, as represented by a code.
Data Element Concept:	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service service provider type

Value domain attributes

Representational attributes

Classification scheme:	Australian and New Zealand Standard Classification of Occupations, First edition, 2006
Representation class:	Code
Data type:	Number
Format:	N[NNN]{NN}
Maximum character length:	6

Data element attributes

Collection and usage attributes

Guide for use:	This data element should be used in conjunction with the data element: *Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service visitation frequency, code N* to gain information on the involvement of Aboriginal health services in the provision of general and mental health care to Indigenous prisoners.

Comments: The Royal Commission into Aboriginal Deaths in Custody recommended that corrective services, in conjunction with Aboriginal health services, should review and report upon the provision of health services to Aboriginal prisoners in correctional institutions and that this review should include, amongst other things, the involvement of Aboriginal health services in the provision of general and mental health care to Aboriginal prisoners (AIHW 2010).

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: AIHW (Australian Institute of Health and Welfare) 2010. The health of Australia’s prisoners 2009. Cat. no. PHE 123. Canberra: AIHW

Relational attributes

Related metadata references: See also Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service visitation frequency, code N Health, Standard 25/08/2011

Implementation in Data Set Specifications: Prison establishments DSS Health, Standard 25/08/2011

Conditional obligation:
Conditional on prisons receiving visits by an Aboriginal community controlled health organisation or an Aboriginal medical service.

ACCHO/AMS visitation frequency

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service visitation frequency, code N
METeOR identifier:	403811
Registration status:	Health, Standard 25/08/2011
Definition:	The frequency of visits by an Aboriginal community controlled health organisation (ACCHO) or an Aboriginal medical service (AMS) to a prison, as represented by a code.
Data Element Concept:	Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service visitation frequency

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number

Accrued mental health care days

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—accrued mental health care days, total N[N(7)]
METeOR identifier:	286770
Registration status:	Health, Standard 08/12/2004
Definition:	The total number of accrued mental health care days provided by admitted patient care services and residential mental health care services within the reference period (from 1 July to 30 June inclusive).
Data Element Concept:	Establishment—accrued mental health care days

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N(7)]
Maximum character length:	8
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

The days to be counted are only those days occurring within the reference period, i.e. from 1 July to the following 30 June for the relevant period, even if the patient/resident was admitted prior to the reference period or discharged after the reference period.

A day is measured from midnight to 2359 hours.

The following basic rules are used to calculate the number of accrued mental health care days:

- Admission and discharge on the same day is equal to one mental health care day.
- For a patient/resident admitted and discharged on different days all days are counted as mental health care days, except the day of discharge and any leave days.

- If the patient/resident remains in hospital or residential care facility from midnight to 2359 hours count as a mental health care day.
- The day a patient/resident goes on leave is not counted as a mental health care day, unless this was also the admission day.
- The day the patient/resident returns from leave is counted as a mental health care day, unless the patient/resident goes on leave again on the same day of return or is discharged.
- Leave days involving an overnight absence are not counted as mental health care days.
- If a patient/resident goes on leave the day they are admitted and does not return from leave until the day they are discharged, count as one mental health care day.
- If the patient/resident remains in a hospital or residential care facility from 1 July to 30 June (the whole of the reference period) count as 365 days (or 366 days in a leap year).
- If the patient/resident remains in a hospital or residential care facility after the end of the reference period (i.e. after 30 June) do not count any days after the end of the reference period.

The following additional rules cover special circumstances and in such cases, override the basic rules:

When calculating accrued mental health care days for the reference period:

- Count the mental health care days of those patients/residents separated during the reference period. Exclude any days that may have occurred before the beginning of the reference period.
- Count the mental health care days of those patients/residents admitted during the reference period who did not separate until the following reference period. Exclude the days after the end of the reference period.
- For patients/residents admitted before the reference period and who remain in after the reference period (i.e. after 30 June), count the mental health care days within the reference period only. Exclude all days before and after the reference period.

Examples of mental health care day counting for a reference period 1 July 2004 to 30 June 2005:

Patient/resident A was admitted to hospital on 4 June 2004 and separated on 6 July 2004. If no leave or transfer occurred counting starts on 1 July. Count would be 5 days as day of discharge is not counted.

Patient/resident B was admitted to hospital on 1 August 2004 and separated on 8 August 2004. If no leave or transfer occurred counting starts on 1 August. Count would be 7 days as day of discharge is not counted.

Patient/resident C was admitted to hospital on 1 June 2005 and separated on 6 July 2005. If no leave or transfer occurred counting starts on 1 June. Count would be 30 days as patient/resident was not discharged on 30 June, so every day up to and including 30 June would be counted.

Patient/resident D was admitted to hospital on 1 August 2003 and has remained continuously in hospital to the present time. If no leave or transfer occurred counting starts on 1 July 2004 and concludes on 30 June 2005. Count would be 365 days as there is no day of discharge.

Collection methods: To be reported for admitted patient care services, including services that are staffed for less than 24 hours, and non-government organisation services where included.

NOTE: These data need to be disaggregated by Specialised mental health service setting (excluding Ambulatory care settings). For admitted patient care settings these counts also need to be disaggregated by Specialised mental health service program type and Specialised mental health service target population.

Implementation in Data Set Specifications: Mental health establishments NMDS 2012-2013 Health, Standard 07/12/2011

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Activity and participation life area

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—activity and participation life area, code (ICF 2001) AN[NNN]

METeOR identifier: 320125

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: The life area in which a person participates or undertakes activities, as represented by a code.

Context: Human functioning and disability

Data Element Concept: Person—activity and participation life area

Value domain attributes

Representational attributes

Classification scheme: International Classification of Functioning, Disability and Health 2001

Representation class: Code

Data type: String

Format: AN[NNN]

Maximum character length: 5

Collection and usage attributes

Guide for use: This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

The activities and participation codes are a neutral list that covers the full range of life areas in which a person can be involved. The domains can be used to record positive or neutral experience of functioning as well as limitations and restrictions.

Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both 'Self care' (chapter level) and 'Looking after one's health' (3 digit level) as the former includes the latter.

The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with respective qualifiers (Activity difficulty level, Activity Need for assistance, Participation extent and Participation satisfaction level) will use the codes as indicated.

CODE d1	Learning and applying knowledge
CODE d2	General tasks and demands
CODE d3	Communication
CODE d4	Mobility
CODE d5	Self-care
CODE d6	Domestic life
CODE d7	Interpersonal interactions and relationships
CODE d8	Major life areas
CODE d9	Community, social and civic life

Data collected at this level will provide a general description of functioning for the person and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For specific more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values is listed in the **Activities** and **Participation** component of the ICF.

An example of a value domain at the 3 digit level from the Self-care chapter may include:

CODE d510	Washing oneself
CODE d520	Caring for body parts
CODE d530	Toileting
CODE d540	Dressing
CODE d550	Eating
CODE d560	Drinking
CODE d570	Looking after one’s health

An example of value domains at the 4 digit level from the Mobility chapter may include:

CODE d4600	Moving around within the home
CODE d4601	Moving around within buildings other than home
CODE d4602	Moving around outside the home and other buildings
CODE d4701	Using private motorized transportation
CODE d4702	Using public motorized transportation

The prefix ***d*** denotes the domains within the component of

Activities and Participation. At the user's discretion, the prefix ***d*** can be replaced by ***a*** or ***p***, to denote activities or participation respectively.

Activity when injured (non-admitted patient)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Injury event—activity type, non-admitted patient code N[N]
METeOR identifier:	268942
Registration status:	Health, Standard 01/03/2005
Definition:	The type of activity undertaken by the non-admitted patient when injured, as represented by a code.
Data Element Concept:	Injury event—activity type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	N[N]
Maximum character length:	2

Permissible values:

Value	Meaning
0	Sports activity
00	Football, rugby
01	Football, Australian
02	Football, soccer
03	Hockey
04	Squash
05	Basketball
06	Netball
07	Cricket
08	Roller blading
09	Other and unspecified sporting activity
1	Leisure activity (excluding sporting activity)
2	Working for income

3	Other types of work
4	Resting, sleeping, eating or engaging in other vital activities
5	Other specified activities
6	Unspecified activities

Collection and usage attributes

Guide for use: To be used for injury surveillance purposes for non-admitted patients when it is not possible to use ICD-10-AM codes. Select the code which best characterises the type of activity being undertaken by the person when injured, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate, select the one that comes first in the code list.

Data element attributes

Collection and usage attributes

Comments: Enables categorisation of injury and poisoning according to factors important for injury control. Acute coronary syndrome procedure type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—acute coronary syndrome procedure type, code NN
METeOR identifier:	356659
Registration status:	Health, Standard 01/10/2008
Definition:	The type of procedure performed, that is pertinent to the treatment of acute coronary syndrome, as represented by a code.
Data Element Concept:	Person—acute coronary syndrome procedure type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
01	Coronary artery bypass graft (CABG)
05	Reperfusion: fibrinolytic therapy
06	Reperfusion: primary percutaneous coronary intervention (PCI)
07	Reperfusion: rescue percutaneous coronary intervention (PCI)
08	Vascular reconstruction, bypass surgery, or percutaneous intervention to the extremities or for aortic aneurysm
09	Amputation for arterial vascular insufficiency
10	Diagnostic cardiac catheterisation/angiography
11	Blood transfusion

	12	Insertion of pacemaker
	13	Implantable cardiac defibrillator
	14	Intra-aortic balloon pump (IABP)
	15	Non-invasive ventilation (CPAP)
	16	Invasive ventilation
	17	Defibrillation
	18	Revascularisation: percutaneous coronary intervention (PCI)
	19	Pulmonary artery (Swan Ganz) catheter
	88	Other
Supplementary values:	99	Not stated/inadequately described

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use:

More than one procedure can be recorded. Record all codes that apply.

Codes ‘88’ and ‘99’ in combination cannot be used in multiple entries.

CODE 06 Reperfusion: primary percutaneous coronary intervention (PCI)

Primary PCI relates to balloon angioplasty and/or stent implantation for reperfusion therapy of a ST-segment-elevation myocardial infarction (STEMI).

CODE 07 Reperfusion: rescue percutaneous coronary intervention (PCI)

Rescue PCI relates to a balloon angioplasty and/or stent implantation that is performed following failed fibrinolysis in people with continuing or recurrent myocardial ischaemia.

CODE 18 Revascularisation: percutaneous coronary intervention (PCI)

Revascularisation PCI relates to the restoration of blood flow through balloon angioplasty and/or stent implantation outside the setting of myocardial salvage for

STEMI. Revascularisation PCI may be performed on a person following STEMI where there is objective evidence of spontaneous or inducible ischaemia or hameodynamic instability. Revascularisation PCI may also be performed on a person with high-risk non-ST-segment-elevation acute coronary syndrome.

When read in conjunction with Person—clinical procedure timing, code N, this metadata item provides information on the procedure(s) provided to a patient prior to or during this presentation.

When read in conjunction with Person—acute coronary syndrome risk stratum, code N, codes 01, 05, 06, 07, 08, 09, 10 and 18 of this metadata item provide information for risk stratification.

Where codes 06, 07 and 18 have been recorded please also record Person - percutaneous coronary intervention procedure, code N.

Collection methods:

For each Person-acute coronary syndrome procedure type, code NN, the following timing data elements must also be recorded, where applicable:

- Person - clinical procedure timing, code N
- Person - intravenous fibrinolytic therapy date, DDMMYYYY
- Person - intravenous fibrinolytic therapy time, hhmm
- Person - primary percutaneous coronary intervention date, DDMMYYYY
- Person - primary percutaneous coronary intervention time, hhmm
- Person - rescue percutaneous coronary intervention date, DDMMYYYY
- Person - rescue percutaneous coronary intervention time, hhmm
- Person - revascularisation percutaneous coronary intervention date, DDMMYYYY
- Person - revascularisation percutaneous coronary intervention time, hhmm
- Person - pacemaker insertion date, DDMMYYYY
- Person - pacemaker insertion time, hhmm
- Person - implantable cardiac defibrillator procedure date, DDMMYYYY
- Person - implantable cardiac defibrillator procedure time, hhmm
- Person - intra-aortic balloon pump procedure date, DDMMYYYY

- Person - intra-aortic balloon pump procedure time, hhmm
- Person - non-invasive ventilation administration date, DDMMYYYY
- Person - non-invasive ventilation administration time, hhmm

Acute coronary syndrome related clinical event type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with acute coronary syndrome—type of acute coronary syndrome related clinical event experienced, code N[N]
METeOR identifier:	338314
Registration status:	Health, Standard 01/10/2008
Definition:	The type of acute coronary syndrome related clinical event, as represented by a code.
Data Element Concept:	Person with acute coronary syndrome—type of acute coronary syndrome related clinical event

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

Permissible values:

Value	Meaning
1	Cardiogenic shock
2	Cardiac rupture
3	Cardiac arrest
4	New or recurrent myocardial infarction
5	Stroke
6	Acute pulmonary oedema
7	Recurrent rest angina with electrocardiogram changes
8	Recurrent rest angina without electrocardiogram changes
9	New onset arrhythmia: atrial
10	New onset arrhythmia: ventricular
11	New onset arrhythmia: heart block (1,2,3)

	12	Unplanned revascularisation
	13	Acute renal failure
	14	Thrombocytopaenia
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Cardiogenic shock

Use this code when the person has experienced cardiogenic shock, including if the person was in shock at the time of presentation to the hospital.

Cardiogenic shock is defined as:

- hypotension (systolic BP <90mmHg for at least 30 minutes or the need for supportive measures to maintain blood pressure of greater than or equal to 90mmHg)

- end-organ hypoperfusion (cool extremities or a urine output of <30ml/hour, and a heart rate ≥60 beats/minute)

- a cardiac index of no more than 2.2 l/min per square meter of body-surface area and a pulmonary-capillary wedge pressure of at least 15 mmHg.

CODE 2 Cardiac rupture

Use this code when the person has a rupture of the ventricular myocardium, the ventricular septum, or a frank papillary muscle rupture. This includes if the person experienced the rupture before presentation to the hospital.

CODE 3 Cardiac arrest

Use this code when the person has experienced cardiac arrest (i.e. the lack of effective cardiac output), including if the person was under arrest at the time of presentation to the hospital.

CODE 4 New or recurrent myocardial infarction

Use this code when the person experiences a myocardial infarction during hospitalisation distinct from the index event at the time of presentation.

Recurrent myocardial infarction is defined by clinical events and cardiac marker elevations after the first 24 hours following presentation to the hospital.

For people presenting without initial evidence of myonecrosis, recurrent MI is defined by:

- A rise in troponin T or I to greater than the diagnostic threshold level (with precision of 10% coefficient of variation) as defined by the local laboratory; OR

- A CK-MB elevation of greater than twice the upper limit of normal for the laboratory (if CK-MB is not available, CK may be used).

For people presenting with evidence of myonecrosis:

- A further rise in troponin of greater than 25% or a re-elevation in CK-MB of greater than 50% (if no CK-MB is drawn, CK may be used) will define recurrent MI

- If the event occurs within 24 hours of PCI, then a level of greater than 3 times the upper limit of normal for CK-MB will be used. If the event occurs within 24 hours of CABG, then a level of greater than 5 times the upper limit of normal for CK-MB will be used.

CODE 5 Stroke

Use this code if the person experiences a loss of neurological function with residual symptoms remaining for at least 24 hours after onset and which occurred before presentation to the hospital. The occurrence of stroke should be evidenced by a record of cerebral imaging (CT or MRI).

CODE 6 Acute pulmonary oedema/congestive heart failure

Use this code when the person has experienced acute pulmonary oedema or congestive heart failure with evidence of supportive clinical signs of ventricular dysfunction. These include:

- Third heart sound (S3)

- Cardiomegaly

- Elevated jugular venous pressure (JVP)

- Chest X-ray evidence of pulmonary congestion

- Requirement for ventilatory assistance (CPAP or intubation).

This includes if acute pulmonary oedema or congestive heart failure was present at the time of presentation to the hospital.

CODE 7 Recurrent rest angina with electrocardiogram (ECG) changes

Use this code when the person has experienced recurrent ischaemic pain occurring at rest believed to be cardiac in origin with associated ECG changes.

CODE 8 Recurrent rest angina without electrocardiogram (ECG) changes

Use this code when the person has experienced recurrent ischaemic pain occurring at rest believed to be cardiac in origin without associated ECG changes.

CODE 9 New onset arrhythmia: atrial

Use this code when the person has experienced an atrial arrhythmia, that was not present before this acute coronary syndrome event, documented by one of the following:

- Atrial fibrillation/flutter

- Supraventricular tachycardia requiring treatment (i.e. requiring cardioversion, drug therapy, or is sustained for greater than one minute).

CODE 10 New onset arrhythmia: ventricular

Use this code when the person has experienced ventricular tachycardia or ventricular fibrillation requiring cardioversion and/or intravenous antiarrhythmics, that was not present before this acute coronary syndrome event.

CODE 11 New onset arrhythmia: heart block (1,2,3)

Use this code when the person has experienced first, second or third degree atrioventricular block with bradycardia with or without the requirement for pacing.

CODE 12 Unplanned revascularisation

Use this code when the person has undergone revascularisation precipitated by 20 minutes or more of recurrent chest pain with/or without objective evidence of ischaemia on the ECG.

Code 13 Acute renal failure

Use this code when the person has acute renal failure as determined by a rise in serum creatinine of x 1.5 or a decrease in GFR by 25% or urine output <0.5mL/kg/h for 6 hours.

Code 14 Thrombocytopenia

Use this code when the person has thrombocytopenia as determined by the platelet count: platelet count dropped to less than 100 x 10^9/L.

Data element attributes

Collection and usage attributes

Guide for use: Record all clinical events that the person experiences from the time of presentation to hospital until discharge from hospital.

More than one event may be recorded.

The time and date must be recorded for each clinical event that occurs.

Comments: An acute coronary syndrome (ACS) related clinical event is a clinical event which can affect the health outcomes of a person with ACS.

Information on the occurrence of these clinical events in people with ACS is required due to an emerging appreciation of their relationship with late mortality.

Acute coronary syndrome related medical history

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—acute coronary syndrome related medical history, code NN
METeOR identifier:	356598
Registration status:	Health, Standard 01/10/2008
Definition:	A person's history of acute coronary syndrome related medical conditions as represented by a code.
Data Element Concept:	Person—acute coronary syndrome related medical history

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
11	Angina (excluding unstable angina): prior existing
12	Angina (excluding unstable angina): new onset
13	Unstable angina
21	Chronic lung disease
31	Heart failure
41	Hypertension
51	Ischaemic: non-haemorrhagic cerebral infarction
52	Haemorrhagic: intracerebral haemorrhage
61	Peripheral artery disease
62	Aortic aneurysm
63	Renal artery stenosis

	71	Sleep apnoea
	81	Previous myocardial infarction
	91	Atrial fibrillation
	92	Other dysrhythmia or conductive disorder
	93	Left ventricular hypertrophy
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Angina:

CODE 11 Angina (excluding unstable angina): prior existing

This code is used where there are symptoms, which can be described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing) suggestive of cardiac ischaemia, the onset of which occured more than two weeks ago.

CODE 12 Angina (excluding unstable angina): new onset

This code is used where there are symptoms which can be described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing) suggestive of cardiac ischaemia; the onset of which occured two or less weeks ago.

CODE 13 Unstable angina

This code is used where a person has experienced new onset or prior existing angina (described as chest pain or pain in either or both shoulders, the back, neck or jaw, or other equivalent discomfort (such as tightness, gripping or squeezing)), which is increasing in severity, duration or frequency.

Chronic lung disease:

CODE 21 Chronic lung disease

This code is used where there is a history or symptoms suggestive of chronic lung disease.

Heart failure:

CODE 31 Heart failure

This code is used where a person has past or current symptoms of heart failure (typically breathlessness or fatigue), either at rest or during physical activity and/or signs of pulmonary or peripheral congestion suggestive of cardiac dysfunction.

Hypertension:

CODE 41 Hypertension

This code is used where there is current use of pharmacotherapy for hypertension and/or clinical evidence of high blood pressure.

CODE 51 Ischaemic: non-haemorrhagic cerebral infarction

This code is used if there is history of stroke or cerebrovascular accident (CVA) resulting from an ischaemic event where the patient suffered a loss of neurological function with residual symptoms remaining for at least 24 hours.

CODE 52 Haemorrhagic: intracerebral haemorrhage

This code is used if there is history of stroke or cerebrovascular accident (CVA) resulting from a haemorrhagic event where the patient suffered a loss of neurological function with residual symptoms remaining for at least 24 hours.

Peripheral arterial disease:

CODE 61 Peripheral artery disease

This code is used where there is history of either chronic or acute occlusion or narrowing of the arterial lumen in the aorta or extremities.

CODE 62 Aortic aneurysm

This code is used where there is a history of aneurysmal dilatation of the aorta (thoracic and or abdominal).

CODE 63 Renal artery stenosis

This code is used where there is a history of functional stenosis of one or both renal arteries.

Sleep apnoea syndrome:

CODE 71 Sleep apnoea

This code is used where there is evidence of sleep apnoea syndrome (SAS) on history.

Myocardial infarction:

CODE 81 Previous myocardial infarction

This code is used where a person has previously experienced a myocardial infarction, excluding the current event that prompted this presentation to hospital. This may be supported by clinical documentation and evidenced by ECG changes or serum cardiac biomarker changes.

Other vascular conditions:

CODE 91 Atrial fibrillation

This code is used where there is a history or symptoms suggestive of atrial fibrillation.

CODE 92 Other cardiac arrhythmias or conductive disorders

This code is used where there is a history of other cardiac arrhythmias or conductive disorders.

CODE 93 Left ventricular hypertrophy

This code is used where there is a history or symptoms suggestive of left ventricular hypertrophy.

Data element attributes

Collection and usage attributes

Guide for use: More than one medical condition may be recorded.

Record only those codes that apply.

Record all codes that apply.

Collection methods: Where codes 21, 31, 51, 52, 61, 62, 63, 71, 91, 92 and 93 are recorded Person - clinical evidence status (acute coronary syndrome related medical conditions), yes/no code N must also be recorded.

Comments: A history of the listed medical conditions is pertinent to the risk stratification and treatment of acute coronary syndrome.

Acute coronary syndrome stratum

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—acute coronary syndrome risk stratum, code N

METeOR identifier: 356665

Registration status: Health, Standard 01/10/2008

Definition: Risk stratum of a person presenting with clinical features consistent with an acute coronary syndrome defined by accompanying clinical, electrocardiogram (ECG) and biochemical features, as represented by a code.

Data Element Concept: Person—acute coronary syndrome risk stratum

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	ST-segment-elevation (myocardial infarction)
	2	Non-ST-segment-elevation ACS with high-risk features
	3	Non-ST-segment-elevation ACS with intermediate-risk features
	4	Non-ST-segment-elevation ACS with low-risk features
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 1 ST-segment-elevation (myocardial infarction)

This code is used where persistent ST elevation of >=1mm in two contiguous limb leads, or ST elevation of >=2mm in two contiguous chest leads, or with new left bundle -

branch block (BBB) pattern on the ECG.

This classification is intended for identification of patients potentially eligible for reperfusion therapy, either pharmacologic or intervention-based. Other considerations such as the time to presentation and the clinical appropriateness of instituting reperfusion are not reflected in this metadata item.

CODE 2 Non-ST-segment-elevation ACS with high-risk features

This code is used when presentation with clinical features consistent with an acute coronary syndrome with high-risk features which include any of the following:

- repetitive or prolonged (> 10 minutes) ongoing chest pain or discomfort;
- elevated level of at least one cardiac biomarker (troponin or creatine kinase-MB isoenzyme);
- persistent or dynamic ECG changes of ST segment depression >= 0.5mm or new T wave >= 2mm;
- transient ST-segment elevation (>= 0.5 mm) in more than 2 contiguous leads;
- haemodynamic compromise: Blood pressure < 90 mmHg systolic, cool peripheries, diaphoresis, Killip Class > 1, and/or new onset mitral regurgitation;
- sustained ventricular tachycardia;
- syncope;
- left ventricular systolic dysfunction (left ventricular ejection fraction < 0.40);
- prior percutaneous coronary intervention within 6 months or prior coronary artery bypass surgery;
- presence of known diabetes (with typical symptoms of ACS);or
- chronic kidney disease (estimated glomerular filtration rate < 60mL/minute) (with typical symptoms of ACS).

This classification is intended for identification of patients potentially eligible for aggressive medical management and coronary angiography and revascularisation.

CODE 3 Non-ST-segment-elevation ACS with intermediate-risk features

This code is used when presentation with clinical features consistent with an acute coronary syndrome and any of the following intermediate-risk features AND NOT meeting the criteria for high-risk ACS:

- chest pain or discomfort within the past 48 hours that occurred at rest, or was repetitive or prolonged (but currently resolved);

- age greater than 65yrs;
- known coronary heart disease: prior myocardial infarction with left ventricular ejection fraction >= 0.40 known coronary lesion more than 50% stenosed;
- no high-risk changes on electrocardiography (see high-risk features);
- two or more of the following risk factors: known hypertension, family history, active smoking or hyperlipidaemia;
- presence of known diabetes (with atypical symptoms of ACS);
- chronic kidney disease (estimated glomerular filtration rate < 60mL/minute) (with atypical symptoms of ACS); or
- prior aspirin use.

This classification is intended for identification of patients potentially eligible for accelerated diagnostic evaluation and further risk stratification.

CODE 4 Non-ST-segment-elevation ACS with low-risk features

This code is used when presentation with clinical features consistent with an acute coronary syndrome without intermediate or high-risk features of non-ST-segment-elevation ACS. This includes onset of anginal symptoms within the last month, or worsening in severity or frequency of angina, or lowering of anginal threshold.

This classification is intended for identification of patients potentially eligible for outpatient investigation discharge on upgraded medical therapy and outpatient investigation.

Data element attributes

Collection and usage attributes

Guide for use:

Other clinical considerations influencing the decision to admit and investigate are not reflected in this metadata item. This metadata item is intended to simply provide a diagnostic classification at the time of, or within hours of clinical presentation.

Acute coronary syndrome symptoms may include:

- tightness, pressure, heaviness, fullness or squeezing in the chest which may spread to the neck and throat, jaw, shoulders, the back, upper abdomen, either or both arms and even into the wrists and hands

- dyspnoea, nausea/vomiting, cold sweat or syncope.

Collection methods: Recorded at time of presentation.

Only one code should be recorded.

Must be recorded in conjunction with Person—acute coronary syndrome procedure type, code NN and Person—clinical procedure timing, code N.

Comments: The clinical, electrocardiogram and biochemical characteristics are important to enable early risk stratification.

Additional body function or structure of patient affected

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—additional body function or structure affected, body function or structure code N[N]
METeOR identifier:	330183
Registration status:	Health, Standard 07/12/2011
Definition:	The body function or structure of the patient alleged to have been affected, in addition to the primary body function or structure affected, as represented by a code.
Data Element Concept:	Patient—additional body function or structure affected

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

Permissible values:

Value	Meaning
1	Mental functions or structures of the nervous system
2	Sensory functions and pain of the eye, ear and related structures
3	Voice and speech functions or structures involved in voice and speech
4	Functions or structures of the cardiovascular, haematological, immunological and respiratory systems
5	Functions or structures of the digestive, metabolic and endocrine systems
6	Genitourinary or reproductive functions and structures
7	Neuromusculoskeletal or movement-related

		functions and structures
	8	Functions and structures of the skin and related structures
	9	Death
Supplementary values:	97	Not applicable
	99	Not stated/inadequately described

Collection and usage attributes

Comments: The coding categories for this value domain are based on the chapter headings for body functions and body structures in the Body component of the World Health Organization's International Classification of Functioning, Disability and Health (ICF 2.1a) (WHO 2003).

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Reference documents: WHO (World Health Organization) 2003. International Classification of Functioning, Disability and Health (ICF). Geneva: WHO

Data element attributes

Collection and usage attributes

Guide for use: This data element should be used in conjunction with the data element *Patient—primary body function or structure affected, body function or structure code N[N]* to provide a greater depth of information on the harm alleged to have resulted from the health-care incident.

Up to three codes may be selected for this data element.

Code 9 'Death' is an invalid code for this data element but is a valid response for the data element: *Patient—primary body function or structure affected, body function or structure code N[N].*

Psychological harm as an additional body function or structure affected should be coded as 1 'Mental functions or structures of the nervous system'. Where a cancer has progressed and affects major body systems, but the organ or body part where the cancer originated is known, record the appropriate code for that organ or body part as the additional body function or structure affected.

Where the patient experiences pain as a result of the incident, and this pain is an additional body function or structure affected, record Code 2 ‘Sensory functions and pain of the eye, ear and related structures’. Where the pain experienced by the patient is deemed to be more disabling than the associated physical or mental damage to the patient, record the body structure or structures with which the pain is closely associated as an additional body function or structure affected.

Code 99 ‘Not stated/Inadequately described’ should be used only when the information is not currently available, but is expected to become available as the claim progresses.

	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 13 Dentistry

'Dentistry' excludes oral and maxillofacial surgery.

CODE 15 Diagnostic radiology

'Diagnostic radiology' includes diagnostic ultrasound.

CODE 16 Otolaryngology

'Otolaryngology' includes ear, nose, throat, head and neck surgeons.

CODE 22 General medicine

'General medicine' includes general and internal medicine physicians and endoscopy.

CODE 25 General surgery

'General surgery' includes surgical procedures, including colorectal surgery.

CODE 27 Gynaecology only

'Gynaecology only' includes gynaecologists who only diagnose, treat and aid in the prevention of disorders of the female reproductive system (RANZCOG 2011).

CODE 31 Midwifery

'Midwifery' includes registered midwives only.

CODE 35 Nuclear medicine

'Nuclear medicine' includes radiotherapy and radiation oncology.

CODE 36 Nursing–general

'Nursing-general' includes enrolled and registered nurses.

CODE 37 Nursing–nurse practitioner

'Nursing–nurse practitioner' includes registered nurse practitioners only.

CODE 39 Obstetrics and gynaecology

'Obstetrics and gynaecology' includes specialists who carry out gynaecological examinations, diagnosis and operations on women; provide medical care before, during and after childbirth; and treat infertility by chemical or operative measures (RANZCOG 2011).

CODE 40 Obstetrics only

'Obstetrics only' includes obstetricians who only provide medical care before, during and after childbirth (RANZCOG 2011).

CODE 41 Occupational and environmental medicine

'Occupational and environmental medicine' should be used for doctors only; occupational therapists should be recorded at Code 67.

CODE 46 Paediatrics

'Paediatrics' excludes neonatal or perinatal medicine and paediatric surgery.

CODE 49 Pathology

'Pathology' includes general pathology, anatomical pathology, chemical pathology, pathological haematology, pathological immunology and clinical microbiology.

CODE 59 Respiratory and sleep medicine

'Respiratory and sleep medicine' includes thoracic medicine.

CODE 67 Other allied health (including complementary medicine)

'Other allied health (including complementary medicine)' includes: acupuncturist, allergy and asthma consultant, alternative health services, audiologist, audiometrist, Chinese medicine therapist, chiropodist, dental hygienist, dental technician, drug and alcohol counsellor, hygiene consultant, naturopath, occupational health and safety practitioner, occupational therapist, optometrist, social worker, speech pathologist, speech therapist and therapeutic masseur.

CODE 68 Other hospital-based medical practitioners

'Other hospital-based medical practitioners' includes junior doctors, resident doctors, house officers, interns, and other clinicians who do not have a specialty.

CODE 71 Anaesthesia

'Anaesthesia' includes general anaesthesia, paediatric anaesthesia and intensive care anaesthesia.

CODE 82 Pain medicine

‘Pain medicine’ includes specialists in managing severe pain problems in the areas of acute pain, cancer pain and chronic pain (Faculty of Pain Medicine 2003).

CODE 97 Not applicable

‘Not applicable’ should be used where no clinical or medical administration staff were involved in the incident.

CODE 99 Not stated/inadequately described

‘Not stated/inadequately described’ should be used when the information is not currently available. Not stated/inadequately described should not be used when a claim is closed.

Comments: The general aim of this list is to include all categories that might be of relevance to medical indemnity claims. The medical specialties included in this value domain are taken from the List of Australian Recognised Medical Specialties, a list approved by the Minister for Health and Ageing (AMC 2009) and from the lists of clinical specialties developed by various health authorities for use in their medical indemnity data collections.

The categories of medical specialists align well between the Australian Prudential Regulation Authority (2006) National Claims and Policies Database (NCPD) and the Medical Indemnity National Collection (MINC). The NCPD specifications have separate codes for several allied health and complementary fields which are subsumed within the MINC category ‘Other allied health (including complementary medicine)’. In the NCPD, ‘student practitioner or intern’ is a separate category. The MINC codes students based on the speciality they are training in, and classifies interns with ‘Other hospital-based medical practitioners’ (AIHW 2011).

Recording the specialty of the individual clinician at this data element does not imply that the individual was ‘at fault’. These individuals may or may not be defendants in the medical indemnity claim.

Data element attributes

Collection and usage attributes

Guide for use:

This data element should be used in conjunction with the data element: *Health-care incident— principal clinician specialty involved in health-care incident, clinical specialties code N[N]* to record the specialties of the clinicians who played a prominent role in the incident that gave rise to the medical indemnity claim. That is, the individuals whose actions/omissions are directly implicated in 'what went wrong'. These individuals may or may not be defendants in the medical indemnity claim.

Up to three codes may be selected for this data element.

For a particular clinician, the specialty recorded should be the main clinical area in which that clinician has formal qualifications (or, in the case of a specialist-in training, is working towards gaining formal qualifications), and/or in which that clinician primarily practices. The specialty recorded may not be the area in which the clinician was working at the time of the incident. For example, if a clinician involved in the incident was a general surgeon, but was working in the Emergency department when the incident occurred, Code 25 'General surgery' should be recorded.

Where a private doctor was closely involved in the incident, the specialty of the private doctor should be recorded.

This data element should be completed on the basis of available information about the specialty of clinicians closely involved in the incident; specialty should not be assumed based on other information. For example, if the incident occurred in the course of repair to an aortic abdominal aneurysm, Code 66 'Vascular surgery' should only be recorded where there is information to confirm that a vascular surgeon was among the clinicians involved.

Where a registrar was closely involved in the incident, the specialty for which the registrar was training at the time of the incident should be recorded.

Where no clinical staff were involved in the incident (for example, where the claim relates to actions of hospital administrative staff) Code 97 'Not applicable' should be recorded.

Conditional obligation:
Conditional on more than one clinician specialty being involved in the health-care incident that gave rise to a medical indemnity claim.

Additional diagnosis

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—additional diagnosis, code (ICD-10-AM 7th edn) ANN{.N[N]}

METeOR identifier: 391322

Registration status: Health, Standard 22/12/2009

Definition: A condition or complaint either coexisting with the principal diagnosis or arising during the episode of admitted patient care, episode of residential care or attendance at a health care establishment, as represented by a code.

Data Element Concept: Episode of care—additional diagnosis

Value domain attributes

Representational attributes

Classification scheme: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition

Representation class: Code

Data type: String

Format: ANN{.N[N]}

Maximum character length: 6

Data element attributes

Collection and usage attributes

Guide for use: Record each additional diagnosis relevant to the episode of care in accordance with the ICD-10-AM Australian Coding Standards. Generally, external cause, place of occurrence and activity codes will be included in the string of additional diagnosis codes. In some data collections these codes may also be copied into specific fields.

The diagnosis can include a disease, condition, injury, poisoning, sign, symptom, abnormal finding, complaint, or other factor influencing health status.

Additional diagnoses give information on the conditions that are significant in terms of treatment required, investigations needed and resources used during the episode of care. They are used for casemix analyses relating to severity of illness and for correct classification of patients into Australian Refined Diagnosis Related Groups (AR-DRGs).

Collection methods: An additional diagnosis should be recorded and coded where appropriate upon separation of an episode of admitted patient care or the end of an episode of residential care or attendance at a health care establishment. The additional diagnosis is derived from and must be substantiated by clinical documentation.

Comments: Additional diagnoses should be interpreted as conditions that affect patient management in terms of requiring any of the following:

- Commencement, alteration or adjustment of therapeutic treatment
- Diagnostic procedures
- Increased clinical care and/or monitoring

In accordance with the Australian Coding Standards, certain conditions that do not meet the above criteria may also be recorded as additional diagnoses.

Additional diagnoses are significant for the allocation of Australian Refined Diagnosis Related Groups. The allocation of patient to major problem or complication and co-morbidity Diagnosis Related Groups is made on the basis of the presence of certain specified additional diagnoses. Additional diagnoses should be recorded when relevant to the patient's episode of care and not restricted by the number of fields on the morbidity form or computer screen.

External cause codes, although not diagnosis of condition codes, should be sequenced together with the additional diagnosis codes so that meaning is given to the data for use in injury surveillance and other monitoring activities.

Supplementary values:	999	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 10 Diagnosis

'Diagnosis' includes missed, delayed or incorrect diagnosis.

'Medication-related' is defined to cover the use of drugs and other medicines in the delivery of health services, including immunisations; excludes 'anaesthetic' and 'blood or blood product-related'.

CODE 20 Medication-related: type and dosage

'Medication-related: type and dosage' includes issues related to type of medication or its dosage.

CODE 21 Medication-related: method of administration

'Medication-related: method of administration' includes issues related to method of administration of medication.

CODE 22 Medication-related: other or not further defined

‘Medication-related: other or not further defined’ includes any medication-related issues other than type, dosage or method of administration. Examples include medication not provided and a patient’s reaction to a correctly prescribed and administered medication.

CODE 30 Anaesthetic

‘Anaesthetic’ includes all issues related to epidural, anaesthetic substances, equipment, monitoring or resuscitation and patient awareness.

‘Procedure’ is defined as an invasive clinical intervention, where there is an incision and/or the body cavity is entered; procedures may be therapeutic or diagnostic. A vaginal delivery is also considered a procedure for the purposes of this metadata item.

CODE 51 Procedure—wrong procedure

‘Procedure—wrong procedure’ includes unnecessary procedures, for example, removal of a healthy appendix.

CODE 53 Procedure—post-operative complications

‘Procedure—post-operative complications’ includes incidents involving unintentionally retained objects following a procedure.

CODE 56 Procedure—post-operative infection

‘Procedure—post-operative infection’ includes wound infection due to a procedure; excludes hospital-acquired infections, for example, post-operative sepsis, needlestick injuries and claims involving failure to properly sterilise equipment.

CODE 57 Procedure—intra-operative complications

‘Procedure—intra-operative complications’ includes complications that arise during the course of a procedure, for example unintended perforations of adjacent organs.

CODE 59 Procedure—other or not further defined

‘Procedure—other or not further defined’ includes alleged negligent procedure (where no further information is available).

‘Treatment’ refers to health-care acts other than ‘medication-related’, ‘anaesthetic’, ‘blood or blood product-related (includes blood transfusions)’ or ‘procedure’. Examples of treatment include applying a dressing to a wound, setting a broken bone, physiotherapy services and psychiatric counselling for mental health patients.

CODE 61 Treatment—not provided

‘Treatment—not provided’ includes, for example, where an ambulance is called to attend but does not arrive, where a patient’s condition deteriorates after the patient elects to leave or is turned away from a medical facility, or where a patient is not provided with the diet required by the patient’s condition.

CODE 62 Treatment—complications

‘Treatment—complications’ includes, for example, developing ulcers under a plaster or dressing or a bone fractured during physiotherapy treatment, or where the failure to clean a wound sustained from an injury results in infection.

CODE 63 Treatment—failure of treatment

‘Treatment—failure of treatment’ includes incorrectly setting a broken bone.

CODE 64 Treatment—other or not further defined

‘Treatment—other or not further defined’ includes any incident or allegation of treatment as defined here, which does not fall under the treatment subcategories listed above.

CODE 70 Consent (includes failure to warn)

‘Consent (includes failure to warn)’ includes no valid consent and failure to warn, cessation or continuation of treatment without consent or against patient’s stated wishes, and disposing of a fetus without the consent of the parents.

CODE 80 Infection control (includes instrument sterilisation)

‘Infection control (includes instrument sterilisation)’ includes hospital-acquired infections, for example, post-operative sepsis, needlestick injuries and claims involving failure to properly sterilise equipment, but excluding post-operative infection.

CODE 90 Device failure (includes problems with implanted devices)

‘Device failure (includes problems with implanted devices)’ includes device failure during insertion and the insertion procedure is consequently aborted. Excludes problems due to the surgical implantation procedure.

CODE 100 Other general duty of care issues

‘Other general duty of care issues’ includes falls, administrative errors, for example, placing a ‘nil by mouth’ sign on the bed of the wrong patient, and patient monitoring and follow-up issues.

CODE 888 Other

'Other' includes medico-legal reports, disciplinary enquiries and other legal issues, breach of confidentiality, record keeping or loss of documents, and harassment and discrimination.

CODE 999 Not stated/inadequately described

'Not stated/inadequately described' should be used when the information is not currently available.

Comments: The definition of 'Procedure' used in the Medical indemnity data set specification was agreed to by the MIDWG during the data development phase of the MINC. This definition is narrower than the definition of 'Procedure' used in the National Health Data Dictionary METeOR identifier 391349.

Steward: Australian Institute of Health and Welfare

Reference documents: National Centre for Classification in Health (NCCH) 2010. The Australian Classification of Health Interventions (ACHI) – Seventh Edition - Tabular list of interventions and Alphabetic index of interventions. Sydney: NCCH, Faculty of Health Sciences, The University of Sydney

Data element attributes

Collection and usage attributes

Guide for use: This data element should be used in conjunction with the data element: *Health-care incident—primary incident or allegation type, health-care code NN[N]* to enable the identification of all medical indemnity claims involving a certain type of incident or allegation.

Up to three codes may be selected.

The Code 999 'Not stated/inadequately described' is not a valid code for this data element as it is valid only for the data element: *Health-care incident—primary incident or allegation type, health-care code NN[N].*

Comments: The coding categories for this data element have been developed with reference to a range of classifications currently in use, among which there is a high degree of commonality in terms of the categories identified. At the time of developing this data element a list of 46 categories of 'clinical incident category alleged in claim' was used in New South Wales to record this information. This list was also adopted for use in Tasmania. In Western Australia eight broad 'incident type' categories were used to collect this information on clincial incident notification forms. Two studies of the epidemiology of adverse events (one Australian and one from the United States of America) used similar, broad categories of the nature of adverse events to analyse data (Thomas et al. 2000; Wilson et al. 1995).

There is concordance between the Australian Prudential Regulation Authority (2006) National Claims and Policies Database claims data item 15 'Cause of loss' and the Medical Indemnity National Collection data item (AIHW 2011).

METeOR identifier:	286620
Registration status:	Community Services, Standard 30/09/2005 Health, Standard 04/05/2005
Definition:	A composite of one or more standard **address** components that describes a low level of geographical/physical description of a location, as represented by text. Used in conjunction with the other high-level address components i.e. Suburb/town/locality, Postcode—Australian, Australian state/territory, and Country, forms a complete geographical/physical address of a person.
Data Element Concept:	Person (address)—address line

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	[X(180)]
Maximum character length:	180

Data element attributes

Collection and usage attributes

Guide for use:

A high-level address component is defined as a broad geographical area that is capable of containing more than one specific physical location. Some examples of a broad geographical area are:

- Suburb, town or locality

- Postcode—Australian or international

- State, Territory, local government area, electorate, statistical local area

- Postal delivery point identifier

- Countries, provinces, etc other than in Australia

These components of a complete address do not form part of the Address line.

When addressing an Australian location, following are the standard address data elements that may be concatenated in the Address line:

- Building/complex sub-unit type

- Building/complex sub-unit number

- Building/property name

- Floor/level number

- Floor/level type

- House/property number

- Lot/section number

- Street name

- Street type code

- Street suffix code

One complete identification/description of a location/site of an address can comprise one or more than one instance of address line.

Instances of address lines are commonly identified in electronic information systems as Address-line 1, Address-line 2, etc.

The format of data collection is less important than consistent use of conventions in the recording of address data. Hence, address may be collected in an unstructured manner but should ideally be stored in a structured format.

Where Address line is collected as a stand-alone item, software may be used to parse the Address line details to separate the sub-components.

Multiple Address lines may be recorded as required.

Collection methods:

The following concatenation rules should be observed when collecting address lines addressing an Australian location.

- Building/complex sub-unit type is to be collected in conjunction with Building/complex sub-unit number and vice versa.

- Floor/level type is to be collected in conjunction with Floor/level number and vice versa.

- Street name is to be used in conjunction with Street type code and Street suffix code.

- Street type code is to be used in conjunction with Street name and Street suffix code.

- Street suffix code is to be used in conjunction with Street name and Street type code.

- House/property number is to be used in conjunction with Street name.

Data type:	String
Format:	X[50]
Maximum character length:	50

Data element attributes

Collection and usage attributes

Guide for use:

This data element represents the name given to an entire building or address site.

Names of persons, associations or businesses should not be used as address site names.

Usage Examples:

Parliament House (Name of the building)

University of Melbourne (Site name of university campus – a complex)

Happy Valley Retirement Village (Site name of gated property – a complex)

Darwin Town Hall (Name of the building)

Blue Hills Farm (Name of the property)

This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006 *Interchange of client information* standard. Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)
- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable).

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Business
	2	Mailing or postal
	3	Residential
	4	Temporary residential
Supplementary values:	9	Unknown/Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Business

This code is used to indicate an address that is the physical location of a business, an office or from where a service is delivered.

CODE 2 Mailing or postal

This code is used to indicate an address that is only for correspondence purposes.

CODE 3 Residential

This code is used to indicate where a person is living. Note that this code is not valid for organisations.

CODE 4 Temporary residential

Temporary accommodation address (such as for a person from rural Australia who is visiting an oncology centre for a course of treatment, or a person who usually resides overseas). Note that this is not valid for organisations.

CODE 9 Unknown/Not stated/inadequately described

This code may also be used where the person has no fixed address or does not wish to have their residential or a correspondence address recorded.

Data element attributes

Collection and usage attributes

Guide for use: A single address may have multiple address types associated with it. Record as many as required.

Collection methods: At least one address must be recorded (this may be an unknown Address type).
Health care establishments should always attempt to collect the residential address of a person who is a health care client when a service is provided. When recording the address for a health care provider or organisation, the business address should always be collected. In addition, other addresses may also need to be recorded for individuals and organisations.
Overseas address:
For individuals record the overseas address as the residential address and record a temporary accommodation address as their contact address in Australia.

Comments: ‘No fixed address’ is coded as unknown because it (the concept) is not a type of address for a person but is an attribute of the person only i.e. it is not a location for which an address may be derived. It is not recommended that an implementation collects this attribute as an address type. A person not having a fixed address constrains the number of address types that can be collected i.e. temporary accommodation and residential address types cannot be collected. However, if it is imperative that this occurs, it is suggested that code 9 be used.

Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

A palliative care strategic plan may be an entire health region's plan, or an aggregation of the region's sub-units' plans. The plan may be specifically for palliative care or a general health service plan that includes palliative care elements.

The palliative care elements in the plan must include all of the following aspects:

- timeframe (the beginning and end-date in years), with a minimum time period of two years to demonstrate a strategic focus

- measurable objectives relating to: service access, quality, utilisation, responsiveness and evaluation
- demonstrated stakeholder involvement in plan development, such as the inclusion of a description of the consultation process in the strategic plan document
- demonstrated links with the National Palliative Care Strategy
- implementation strategies (can include resources identified for service delivery)
- evidence of ongoing development in subsequent plans.

A strategic plan typically has a mission statement, outlines a vision, values and strategies, and includes goals and objectives. A strategic plan may: serve as a framework for decisions; provide a basis for more detailed planning; explain the business to others in order to inform, motivate and involve; assist benchmarking and performance monitoring; stimulate change and become a building block for next plan.

The plan will ideally address both palliative care at the specialist level and palliative care at the primary care (i.e. non-specialist) level.

CODE 1 Yes
The administrative health region has a written strategic plan which incorporates palliative care elements, and which includes all specified strategic plan aspects.

CODE 2 No
The administrative health region does not have a written strategic plan which incorporates palliative care elements, or has a plan with only partial coverage of the specified strategic plan aspects.

Collection and usage attributes

Guide for use: Public patient:

A person, eligible for Medicare, who receives or elects to receive a public hospital service free of charge.

Includes: patients in public psychiatric hospitals who do not have the choice to be treated as a private patient. Also includes overseas visitors who are covered by a reciprocal health care agreement, and who elect to be treated as public patients.

Private patient:

A person who elects to be treated as a private patient and elects to be responsible for paying fees for the type referred to in clause 49 of the Australian Health Care Agreements (2003–2008).

Clause 49 states that:

Private patients, compensable patients and ineligible persons may be charged an amount for public hospital services as determined by (the state or territory).

All patients in private hospitals (other than those receiving public hospital services and electing to be treated as a public patient) are private patients.

Includes: all patients who are charged (regardless of the level of the charge) or for whom a charge is raised for a third party payer (for example, Department of Veterans' Affairs and Compensable patients). Also includes patients who are Medicare ineligible and receive public hospital services free of charge at the discretion of the hospital, and prisoners, who are Medicare ineligible while incarcerated.

Data element attributes

Collection and usage attributes

Guide for use:

Australian Health Care Agreements 2003–08 state that eligible persons are to be given the choice to receive, free of charge as public patients, health and emergency services.

At the time of, or as soon as practicable after, admission for a public hospital service, the patient must elect in writing to be treated as either

- a public patient or
- a private patient

This item is independent of the patient's hospital insurance status and room type.

Notes:
Inability to sign: In cases where the patient is unable to complete the patient election form, the patient should be assumed to be a public patient.

Compensation funding decisions: A patient may be recorded as a public patient as an interim patient election status while the patient's compensable status is being decided.

Inter-hospital contracted care: If the patient receives inter-hospital contracted care the following guidelines can be used if no further information is available:

- If the patient received contracted care that was purchased by a public hospital then it will be assumed that they elected to be treated as a public patient.
- If the patient received contracted care that was

purchased by a private hospital then it will be assumed that they elected to be treated as a private patient.

Guide for use:

Admitted patient service units should be differentiated by target population and program type. For example, if a hospital had separate wards for child and adolescent and general adult populations, these should be reported as separate service units. Similarly, if the hospital provided separate wards for older persons acute and older persons other program types, such as rehabilitation or extended care, this would require separate service units to be identified (that is, defined by the *Specialised mental health service—admitted patient care program type, code N* data element as well as the *Specialised mental health service—target population group, code N* data element). Where a hospital has, for example, two older persons acute admitted patient service units, these only need to be reported as one combined older persons acute admitted patient service unit to satisfy the minimum reporting requirements for NMDS purposes, but could be reported as two separate service units if desired. For additional information, please refer to the glossary item **Admitted patient mental health care service.**The complete identifier string, including State/Territory identifier, Region identifier, Organisation identifier, Hospital identifier and Admitted patient service unit identifier, should be a unique code for the service unit in that state/territory. Where applicable, service unit reporting structures should be identical between all mental health collections (e.g., Mental Health National Minimum Data Sets and the Mental Health National Outcomes and Casemix Collection (NOCC)).

Age

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—age, total years N[NN]
METeOR identifier:	303794
Registration status:	Community Services, Standard 29/04/2006 Housing assistance, Standard 10/02/2006 Health, Standard 08/02/2006 Early Childhood, Standard 21/05/2010 Tasmanian Health, Proposed 28/09/2011
Definition:	The age of the person in (completed) years at a specific point in time.
Context:	Age is a core data element in a wide range of social, labour and demographic statistics. It is used in the analyses of service utilisation by age group and can be used as an assistance eligibility criterion.
Data Element Concept:	Person—age

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3

Supplementary values:

Value	Meaning
999	Unknown/not stated

Unit of measure:	Year

Data element attributes

Collection and usage attributes

Guide for use:

Age in single years (if aged under one year, record as zero).

If age (or date of birth) is unknown or not stated, and cannot be estimated, use Code 999.

National community services and housing assistance data dictionary specific:

If year of birth is known (but date of birth is not) use the date, 0101YYYY of the birth year to estimate age (where YYYY is the year of birth).

National housing assistance data dictionary specific:

In the housing assistance data collections age is calculated at 30 June for the corresponding year.

Collection methods:

Although collection of date of birth allows more precise calculation of age, this may not be feasible in some data collections, and alternative questions are: Age last birthday?

What was .... age last birthday?

What is .... age in complete years?

Comments:

National community services data dictionary specific:

Different rules for reporting data may apply when estimating the Date of birth of children aged under 2 years since the rapid growth and development of children within this age group means that a child’s development can vary considerably over the course of a year. Thus, more specific reporting of estimated age is recommended.

Those who need to conduct data collections for children where age is collected in months, weeks, or days should do so in a manner that allows for aggregation of those results to this standard.

Age range

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—age range, code NN

METeOR identifier: 290540

Registration status: Health, Standard 04/05/2005

Definition: The age range that best accommodates a person's completed age in years, at the time of data collection, as represented by a code.

Data Element Concept: Person—age range

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: NN

Maximum character length: 2

Permissible values:

Value	Meaning
01	0-4

	02	5-14
	03	15-24
	04	25-34
	05	35-44
	06	45-54
	07	55-64
	08	65-74
	09	75 years or older
Supplementary values:	99	Not stated

Data element attributes

Collection and usage attributes

Guide for use: Used in computer assisted telephone interview (CATI) surveys in cases where the specific age is not available.

Depending on the collection a different starting age may be used, but should map back to the standard output.

Information at a finer level can be collected as long as it maps back to the proposed data domain, e.g. 75+ age group can be split into 75-84 and 85 years or older.

Collection methods: Although collection of date of birth allows more precise calculation of age, as does the collection of a single age, this may not always be feasible. Age range should be derived from a question on date of birth or age at last birthday.

Comments: In cases where an exact age is not known or not stated, age may be reported as an age range. The age ranges are consistent with the standard 10 year ranges recommended by the ABS.

12	Never in my life

Supplementary values:	99	Not reported

Data element attributes

Collection and usage attributes

Collection methods:

The World Health Organisation, in its 2000 International Guide for Monitoring Alcohol Consumption and Related Harm document, suggests that in assessing alcohol consumption patterns a 'Graduated Quantity Frequency' method is preferred. This method requires that questions about the quantity and frequency of alcohol consumption should be asked to help determine short-term and long-term health consequences. This information can be collected (but not confined to) the following ways:

- in a clinical setting with questions asked by a primary healthcare professional
- as a self-completed questionnaire in a clinical setting
- as part of a health survey
- as part of a computer aided telephone interview.

It should be noted that, particularly in telephone interviews, the question(s) asked may not be a direct repetition of the Value domain; yet they may still yield a response that could be coded to the full Value domain or a collapsed version of the Value domain.

Alcohol consumption in standard drinks per day (self reported)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—alcohol consumption amount (self-reported), total standard drinks NN

METeOR identifier: 270249

Registration status: Health, Standard 01/03/2005

Definition: A person's self-reported usual number of alcohol-containing standard drinks on a day when they consume alcohol.

Data Element Concept: Person—alcohol consumption amount

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NN

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Consumption not reported

Unit of measure: Standard drink

Collection and usage attributes

Guide for use: Alcohol consumption is usually measured in standard drinks.

An Australian standard drink contains 10 grams of alcohol, which is equivalent to 12.5 millilitres of alcohol.

Data element attributes

Collection and usage attributes

Guide for use: This estimation is based on the person's description of the type (spirits, beer, wine, other) and number of standard drinks, as defined by the National Health and Medical Research Council (NH&MRC), consumed per day. One standard drink contains 10 grams of alcohol.

The following gives the NH&MRC examples of a standard drink:

- Light beer (2.7%):

- 1 can or stubbie = 0.8 a standard drink

- Medium light beer (3.5%):
  - 1 can or stubbie = 1 standard drink
- Regular Beer - (4.9% alcohol):
  - 1 can = 1.5 standard drinks
  - 1 jug = 4 standard drinks
  - 1 slab (cans or stubbies) = about 36 standard drinks
- Wine (9.5% - 13% alcohol):
  - 750-ml bottle = about 7 to 8 standard drinks
  - 4-litre cask = about 30 to 40 standard drinks
- Spirits:
  - 1 nip = 1 standard drink
  - Pre-mixed spirits (around 5% alcohol) = 1.5 standard drinks

When calculating consumption in standard drinks per day, the total should be reported with part drinks recorded to the next whole standard drink (e.g. 2.4 = 3).

Collection methods:

The *World Health Organisation's 2000 International Guide for Monitoring Alcohol Consumption and Related Harm document* suggests that in assessing alcohol consumption patterns a 'Graduated Quantity Frequency' method is preferred. This method requires that questions about the quantity and frequency of alcohol consumption should be asked to help determine short-term and long-term health consequences.

Angina status

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—angina status, Canadian Cardiovascular Society code N

METeOR identifier: 338335

Registration status: Health, Standard 01/10/2008

Definition: The limitation of physical activity experienced by a person with the onset of angina, as represented by the Canadian Cardiovascular Society code.

Data Element Concept: Person—angina status

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	No angina with ordinary physical activity
	2	Slight limitation of ordinary physical activity
	3	Marked limitation of ordinary physical activity
	4	Inability for any physical activity without anginal symptoms
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: Code 1 No angina with ordinary physical activity

Use this code for patients who have no angina on ordinary physical activity such as walking or stair climbing. Angina occurs with strenuous, rapid or prolonged exertion at work or recreation.

Code 2 Slight limitation of ordinary physical activity

Use this code for patients for whom angina occurs on walking or climbing stairs rapidly, walking uphill, walking or climbing stairs after a meal, or under emotional stress, or in the cold, or only during the first few hours after waking.

Code 3 Marked limitation or ordinary physical activity

Use this code for patients where angina occurs walking one or two blocks on the level and climbing one or more flights of stairs in normal conditions and at a normal pace.

Code 4 Inability for any physical activity without anginal symptoms

Use this code for patients who are unable to carry on any physical activity without discomfort - anginal symptoms may be present at rest.

Collection methods: Angina status is self-reported by the person but is interpreted, coded and recorded by the health professional.

Antenatal care visits

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Female—number of antenatal care visits, total N[N]
Synonymous names:	Number of antenatal care visits
METeOR identifier:	423828
Registration status:	Health, Standard 12/10/2011
Definition:	The total number of **antenatal care** visits attended by a pregnant female.
Data Element Concept:	Female—number of antenatal care visits

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Antenatal care visits are attributed to the pregnant woman.

In **rural and remote locations** where a midwife or doctor is not employed, registered Aboriginal health workers and **registered nurses** may perform this role within the scope of their training and skill licence.

Include all pregnancy-related appointments with medical doctors where the medical officer has entered documentation related to that visit on the antenatal record.

An antenatal care visit does not include a visit where the sole purpose of contact is to confirm the pregnancy only, or those contacts that occurred during the pregnancy that related to other non-pregnancy related issues.

An antenatal care visit does not include a visit where the sole purpose of contact is to perform image screening, diagnostic testing or the collection of bloods or tissue for pathology testing. Exception to this rule is made when the health professional performing the procedure or test is a doctor or midwife and the appointment directly relates to this pregnancy and the health and wellbeing of the fetus.

Collection methods: Collect the total number of antenatal care visits for which there is documentation included in the health record of pregnancy and/or birth. To be collected once, after the onset of labour. Include all medical specialist appointments or medical specialist clinic appointments where the provider of the service event has documented the visit on the health record.

Multiple visits on the same day should be recorded as one visit.

Comments: The scope and definition of antenatal care visits was developed through consultation with stakeholders from midwifery, obstetric, perinatal data managers and other interested parties in 2010.

Anticipated patient election status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—anticipated accommodation status, code N
METeOR identifier:	270074
Registration status:	Health, Standard 01/03/2005
Definition:	Accommodation chargeable status nominated by the patient when placed on an elective surgery waiting list, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—anticipated accommodation status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Public
2	Private

Collection and usage attributes

Guide for use:

CODE 1 Public patient:

An eligible person who receives or elects to receive a public hospital service free of charge.

CODE 2 Private patient:

An eligible person who elects to be treated as a private patient; and elects to be responsible for paying fees of the type referred to in clause 57 (clause 58 of the Northern Territory Agreement) of the Australian Health Care Agreements.
Clause 57 states that 'Private patients and ineligible persons may be charged an amount for public hospital services as determined by the State'.

Data element attributes

Collection and usage attributes

Guide for use:

The election status nominated by the patient at the time of being placed on an elective surgery waiting list, to be treated as either:

- a public patient; or
- a private patient

This item is independent of patient's hospital insurance status. The definitions of a public and private patient are those in the 1998-2003 Australian Health Care Agreements

Patients whose charges are to be met by the Department of Veterans' Affairs are regarded as private patients.

Comments:

Anticipated election status may be used for the management of elective surgery waiting lists, but the term is not defined under the 1998-2003 Australian Health Care Agreements. Under the Australian Health Care Agreements, patients are required to elect to be treated as a public or private patient, at the time of, or as soon as practicable after admission. Therefore, the anticipated patient election status is not binding on the patient and may vary from the election the patient makes on admission.

Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 01 GENERAL DENTAL PRACTICE

That part of dental practice that deals with a range of general dental care.

CODE 02 DENTO-MAXILLOFACIAL RADIOLOGY

That part of dental practice that deals with diagnostic imaging procedures applicable to the hard and soft tissues of the oral and maxillofacial region and to other structures which are relevant for the proper assessment of oral conditions.

CODE 03 ENDODONTICS

That part of dental practice that deals with the morphology, physiology, and pathology of the human tooth and, in particular, the dental pulp, root and peri-radicular tissues. It includes the biology of the normal pulp, crown, root and peri-radicular tissues and the aetiology, prevention, diagnosis and treatment of diseases and injuries that affect these tissues.

CODE 04 ORAL AND MAXILLOFACIAL SURGERY

That part of dental practice that deals with the diagnosis, surgical and adjunctive treatment of diseases, injuries and defects of the human jaws and associated structures.

CODE 05 ORAL SURGERY

That part of dental practice that deals with the diagnosis, surgical and adjunctive treatment of diseases and injuries limited to the dento-alveolar complex.

CODE 06 ORAL MEDICINE

That part of dental practice that deals with the clinical diagnosis, assessment and principally non-surgical, pharmacological management of anatomical variants, pathological conditions, diseases and pain of the dental, oral and adjacent anatomical structures and the dental/oral manifestations and complications of systemic diseases, pathology and conditions and their treatment.

CODE 07 ORAL PATHOLOGY

That part of dental practice that deals with diseases of the teeth, jaws, oral soft tissues and associated structures, studies their causes, pathogenesis and effects, and by use of clinical, radiographic, microscopic and other laboratory procedures establishes differential diagnoses and provides forensic evaluations.

CODE 08 ORTHODONTICS

That part of dental practice that deals with the study and supervision of the growth and development of the dentition and its related anatomical structures, including preventive and corrective procedures of dentofacial irregularities requiring the re-positioning of teeth, jaws, and/or soft tissues by functional or mechanical means.

CODE 09 PAEDIATRIC
DENTISTRY (PAEDODONTICS)

That part of dental practice that deals with the prevention and the treatment of dental diseases and abnormalities in children and their associated developmental and behavioural problems.

CODE 10 PERIODONTICS

That part of dental practice that deals with the prevention, recognition, diagnosis and treatment of the diseases and disorders of the investing and supporting tissues of natural teeth or their substitutes.

CODE 11 PROSTHODONTICS

That part of dental practice that deals with the restoration and maintenance of oral health, function and appearance by coronal alteration or reconstruction of natural teeth, or the replacement of missing teeth and contiguous oral and maxillofacial tissues with substitutes.

CODE 12 PUBLIC HEALTH DENTISTRY

That part of dental practice that deals with the community as the patient rather than the individual, being concerned with oral health education of the public, applied dental research and administration of dental care programmes including prevention and control of oral diseases on a community basis.

CODE 13 SPECIAL NEEDS DENTISTRY

That part of dental practice that deals with patients where intellectual disability, medical, physical or psychiatric conditions require special methods or techniques to prevent or treat oral health problems, or where such conditions necessitate special dental treatment plans.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

	06	Midwifery management
	07	Midwifery research
	08	Neonatal care
	09	Postnatal care
	10	Other
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

The midwifery care during the woman's pregnancy, labour and birth and the postnatal period as well as the care of the well, normal baby is undertaken in partnership with the woman, consulting and referring to other health professionals as required. This care also includes preventative measures, the promotion of normal birth, the detection of complication in mother and child, accessing medical care or other appropriate assistance and the carrying out of emergency measures.

CODE 01 ANTENATAL CARE

Care, including counselling and education of the woman, and care of her unborn baby from the time the woman's pregnancy is diagnosed until the onset of labour.

CODE 02 CARE DURING LABOUR AND BIRTH

Care, including advocacy and support of the woman and her baby during all stages of labour and during the baby's birth.

CODE 03 CONTINUUM OF MIDWIFERY CARE

Care across the continuum of the woman's pregnancy, labour, the baby's birth and the post natal period.

CODE 04 MATERNAL AND CHILD HEALTH

Care of the mother and child following the postnatal period of 6 weeks focussing on parenting and the child's growth and development, up until at least the age of 5 years and in some cases beyond that age.

CODE 05 MIDWIFERY EDUCATION

The design, planning, implementation, delivery and evaluation of midwifery education and/or staff development programs and management of educational resources.

CODE 06 MIDWIFERY MANAGEMENT

The management of a health unit or sub-unit of a service, hospital or community health care facility providing midwifery services and care, supervising midwives and the financial resources to enable the provision safe, cost effective midwifery care within the service and monitors quality, clinical standards and the professional development of midwives.

CODE 07 MIDWIFERY RESEARCH

The design, planning, implementation and evaluation of midwifery research programs and projects and management of research resources.

CODE 08 NEONATAL CARE

Care and close observation of the normal well newborn baby ensuring the baby's continued well being, growth and development in the first 6 weeks of life.

CODE 09 POSTNATAL CARE

Care, including counselling and education of the woman and care of her baby from the baby's birth until the baby is 6 weeks old.

CODE 10 OTHER

All other areas of midwifery not covered above.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

Collection and usage attributes

Guide for use:

CODE 01 AGED CARE

Nursing care to the elderly in community settings, residential aged care facilities, retirement villages and health care facilities.

CODE 02 CHILD AND FAMILY HEALTH

Nursing care to children from birth to school age and their families with an emphasis on the prevention, early detection of, and early intervention in, physical, emotional and social problems affecting children and their families such as assistance with parentcraft, immunisation and developmental milestones.

CODE 03 COMMUNITY HEALTH

Nursing care, health counselling, screening and education to individuals, families and groups in the wider community with a focus on patient independence and health promotion.

CODE 04 CRITICAL CARE AND EMERGENCY

Provides nursing care to critically ill patients and patients with unstable health following injury, surgery or during the acute phase of diseases, integrating new technological equipment into care in settings such as high dependency units, intensive care units, emergency departments or retrieval services.

CODE 05 EDUCATION

Design, planning, implementation, evaluation and delivery of nursing education and staff development programs, and management of educational resources.

CODE 06 MANAGEMENT

Management of a health service unit or sub-unit of a hospital, aged care or community health care facility, supervision of nursing staff and financial resources to enable the provision of safe, cost effective nursing care within a specified field or for a particular unit, and monitoring of quality, clinical standards and professional development of nurses.

CODE 07 MEDICAL

Nursing care to patients with conditions, such as infections, metabolic disorders and degenerative conditions, which require medical intervention in a range of health, aged care and community settings.

CODE 08 GENERAL PRACTICE/MEDICAL PRACTICE

Clinical care to patients, clinical organisation and practice administration, and the facilitation of communication within a general practice environment and between the practice and outside organisations and individuals.

CODE 09 MENTAL HEALTH

Nursing care to patients with mental health illness, disorder and dysfunction, and those experiencing emotional difficulties, distress and crisis in health, welfare and aged care facilities, correctional services and the community.

CODE 10 MIDWIFERY

Nursing care and advice to women during pregnancy, labour and childbirth, and postnatal care for women and babies in a range of settings such as the home, community, hospitals, clinics and health units.

CODE 11 PAEDIATRICS

Providing nursing care and advice regarding internal diseases and disorders in children from birth up to, and including, adolescence.

CODE 12 PERI-OPERATIVE

Nursing care to patients before, during and immediately after surgery, assessment of patients' condition, planning of nursing care for surgical intervention, maintenance of a safe and comfortable environment, assistance to Surgeons and Anaesthetists during surgery, and monitoring of patients' recovery from anaesthetic, prior to return to, or discharge from, ward.

CODE 13 REHABILITATION AND DISABILITY

Nursing care to patients recovering from injury and illness, and assistance and facilitation for patients with disabilities to live more independently.

CODE 14 RESEARCH

The design, conduct and evaluation of nursing and interdisciplinary research projects, and promotion of the implementation of research findings into clinical nursing practice.

CODE 15 SURGICAL

Nursing care to patients with injuries and illness that require surgical intervention.

CODE 16 OTHER

All other areas of nursing practice not covered above.

Registered health professionals on leave at the time of registration are asked to report their usual principle area of practice worked.

Area of usual residence

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—area of usual residence, geographical location code (ASGC 2011) NNNNN

METeOR identifier: 455536

Registration status: Community Services, Standard 21/02/2012
Health, Standard 22/11/2011
Early Childhood, Standard 09/03/2012

Definition: Geographical location of usual residence of the person, as represented by a code.

Data Element Concept: Person—area of usual residence

Value domain attributes

Representational attributes

Classification scheme: Australian Standard Geographical Classification 2011

Representation class: Code

Data type: Number

Format: NNNNN

Maximum character length: 5

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use: The geographical location is reported using a five digit numerical code to indicate the Statistical Local Area (SLA) within the reporting state or territory, as defined in the Australian Standard Geographical Classification (ASGC) (Australian Bureau of Statistics (ABS), catalogue number 1216.0). It is a composite of state/territory identifier and SLA (first digit = state/territory identifier, next four digits = SLA).

The Australian Standard Geographical Classification (ASGC) is updated by the ABS on an annual basis, with a date of effect of 1 July each year.

Up until 2007, the ABS's National Localities Index (NLI) (catalogue number 1252.0.55.001) was available as a coding tool designed to assist users assign the ASGC Main Structure codes to street address information. However, the NLI is no longer produced by the ABS. To replace the Localities file of the NLI, the ABS has created a Locality to SLA correspondence file for 2011. This file is available on request by contacting ABS Geography at geography@abs.gov.au.

Collection methods:

When collecting the geographical location of a person's usual place of residence, the ABS recommends that 'usual' be defined as: 'the place where the person has or intends to live for 6 months or more, or the place that the person regards as their main residence, or where the person has no other residence, the place they currently reside.' Apart from collecting a person's usual place of residence there is also a need in some collections to collect area of residence immediately prior to or after assistance is provided, or at some other point in time.

Comments:

Geographical location is reported using SLA to enable accurate aggregation of information to larger areas within the ASGC (such as Statistical Subdivisions and Statistical Divisions) as well as detailed analysis at the SLA level. The use of SLA also allows analysis relating the data to information compiled by the ABS on the demographic and other characteristics of the population of each SLA. Analyses facilitated by the inclusion of SLA information include:

- comparison of the use of services by persons residing in different geographical areas;
- characterisation of catchment areas and populations for establishments for planning purposes; and
- documentation of the provision of services to residents of states or territories other than the state or territory of the provider.

Value domain attributes

Representational attributes

Classification scheme:	Australian Statistical Geography Standard 2011
Representation class:	Code
Data type:	String
Format:	N(9)
Maximum character length:	9

Collection and usage attributes

Guide for use:

SA2 coding structure:

An SA2 is identifiable by a 9-digit fully hierarchical code. The SA2 identifier is a 4-digit code, assigned in alphabetical order within an SA3. An SA2 code is only unique within a state/territory if it is preceded by the state/territory identifier.

For example:

State/territory	SA4	SA3	SA2
N	NN	NN	NNNN

Comments:

There are 2,196 SA2 spatial units. In aggregate, they cover the whole of Australia without gaps or overlaps. Jervis Bay Territory, the Territory of the Cocos (Keeling) Islands and the Territory of Christmas Island are each represented by an SA2.

Guide for use: The geographical location is reported using a nine digit numerical code to indicate the Statistical Area (SA) within the reporting state or territory, as defined in the Australian Statistical Geography Standard (ASGS) (Australian Bureau of Statistics (ABS), catalogue number 1270.0.55.001).

Collection methods: When collecting the geographical location of a person's usual place of residence, the ABS recommends that 'usual' be defined as: 'the place where the person has or intends to live for 6 months or more, or the place that the person regards as their main residence, or where the person has no other residence, the place they currently reside.' Apart from collecting a person's usual place of residence there is also a need in some collections to collect area of residence immediately prior to or after assistance is provided, or at some other point in time.

Comments: Geographical location is reported using Statistical Area to enable accurate aggregation of information to larger areas within the ASGS as well as detailed analysis at the SA2 level. The use of SA2 also allows analysis relating the data to information compiled by the ABS on the demographic and other characteristics of the population of each SA2. Analyses facilitated by the inclusion of SA2 information include:

- comparison of the use of services by persons residing in different geographical areas;
- characterisation of catchment areas and populations for establishments for planning purposes; and
- documentation of the provision of services to residents of states or territories other than the state or territory of the provider.

Classification scheme:	International Classification of Functioning, Disability and Health 2001	
Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	0	Does not need help/supervision
	1	Sometimes needs help/supervision
	2	Always needs help/supervision
	3	Unable to do this task or action, even with assistance
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept **'Disability'** and gives an indication of the experience of disability for a person.

In the context of health, an activity is the execution of a task or action by an individual. Activity limitations are difficulties an individual may have in executing an activity.

Activity limitation varies with the environment and is assessed in relation to a particular environment; the absence or presence of assistance, including aids and equipment, is an aspect of the environment.

This value domain records the level of a person's need for help or supervision, in a specified domain, in their overall life. This means that the need for assistance may not be directly relevant to the health or community care service being provided.

Where a life area includes a range of examples, (e.g. domestic life includes cooking, cleaning and shopping), if a person requires assistance in any of the areas then the highest level of assistance should be recorded.

Where need for assistance varies markedly over time (e.g. episodic psychiatric conditions) please record the average level of assistance needed.

The presence of an activity limitation with a given domain is indicated by a non-zero response in this value domain. Activity is limited when an individual, in the context of a health condition, either has need for assistance in performing an activity in an expected manner, or cannot perform the activity at all.

CODE 0 is used when the person has no need for supervision or help and can undertake the activity independently.

CODE 1 is used when the person sometimes needs assistance to perform an activity.

CODE 2 is used when the person always needs assistance to undertake the activity and cannot do the activity without assistance.

CODE 3 is used when the person cannot do the activity even with assistance

CODE 8 is used when a person's need for assistance to undertake the activity is unknown or there is insufficient information to use codes 0-3.

CODE 9 is used where the need for help or supervision is due to the person's age. For example, Education for persons less than 5 years and work for persons less than 15 years.

At risk of suicide or self-harm indicator

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Prison entrant—at risk of suicide or self-harm indicator, yes/no code N
METeOR identifier:	412490
Registration status:	Health, Standard 25/08/2011
Definition:	An indicator of whether a prison entrant has been identified as being at risk of suicide or self-harm, as represented by a code.
Data Element Concept:	Prison entrant—at risk of suicide or self-harm indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: Self-harm is when a person deliberately inflicts physical harm to themself, often in secret and without anyone else knowing about it. Self-harm is not necessarily a suicide attempt, although it may include suicidal behaviour.

Comments: Entry to prison can be a time of increased vulnerability and risk of suicide or self-harming behaviours. All prisoners upon reception into prison are assessed to identify those at current risk of suicide or self-harm. These prisoners are then provided with closer observation and monitoring.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Australian postcode (address)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Address—Australian postcode, code (Postcode datafile) {NNNN}

METeOR identifier: 429894

Registration status: Community Services, Standard 06/02/2012
Health, Standard 07/12/2011
Early Childhood, Standard 09/03/2012

Definition: The Australian numeric descriptor for a postal delivery area for an address.

Data Element Concept: Address—Australian postcode

Value domain attributes

Representational attributes

Classification scheme: Postcode datafile

Representation class: Code

Data type: Number

Format: {NNNN}

Maximum character length: 4

Data element attributes

Collection and usage attributes

Guide for use: Australian postal addresses should include a valid postcode. Refer to the Australia Post Address Presentation Standard for rules on presentation and positioning of postcodes on mail.

For a full list of Australian postcodes visit the Australia Post website: www.auspost.com.au

This data element may be used in the analysis of data on a geographical basis which involves a conversion from postcodes to the Australian Bureau of Statistics (ABS) postal areas. This conversion results in some inaccuracy of information as postcodes do not have a geographic definition and boundaries are not well defined. However, in some data sets postcode is the only geographic identifier, therefore the use of other more accurate indicators (e.g.

Statistical areas - SA) is not always possible.

When dealing with aggregate data, postal areas, converted from postcodes, can be mapped to Australian Statistical Geography Standard (ASGS) codes using an ABS concordance, for example to determine SA2s. For a more advanced concordance, locality, postcode and state, which are all part of an address, used in conjunction can effectively code data to the SA1 level and above in the ASGS.

This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006 *Interchange of client information* standard. Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)
- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable).

Collection and usage attributes

Guide for use: These Australian state/territory codes are used for addressing purposes only. The codes are listed in the order commonly used for statistical reporting by ABS and used in the National Standard for Australian state/territory identifier.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Origin: Standards Australia 2006. AS 4590—2006 Interchange of client information. Sydney: Standards Australia.

Data element attributes

Collection and usage attributes

Guide for use: This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006 *Interchange of client information* standard. Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)
- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable).

Average available beds for hospital-in-the-home patients

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Occupied bed—hospital in the home care, average number of beds N[NNN.N]
METeOR identifier:	373955
Registration status:	Health, Standard 24/03/2009
Definition:	The number of beds used to care for hospital admitted patients in their place of residence as a substitute for hospital accommodation, calculated by dividing the number of days of **hospital-in-the-home care** reported for the period by the number of days in the period. Place of residence may be permanent or temporary.
Data Element Concept:	Occupied bed—hospital in the home care

Value domain attributes

Representational attributes

Representation class:	Average
Data type:	Number
Format:	N[NNN.N]
Maximum character length:	5
Unit of measure:	Bed

Collection and usage attributes

Guide for use:	Average available beds, rounded to the nearest decimal or whole number.

Data element attributes

Collection and usage attributes

Guide for use:	Calculated by dividing the total hospital-in-the-home patient days by the number of days in the period, e.g. in a normal year, a hospital records 4000 hospital-in-the-home patient days – the average hospital-in-the-home beds would be 4000/365 = 11.0.
Collection methods:	Beds exclusively or predominantly for overnight-stay admitted

care, beds exclusively or predominantly for same-day admitted care, and non-special-care neonatal cots are collected and reported in separate categories.

Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted and that no available bed is counted more than once. A bed should first be assessed as available and then categorised according to its predominant use. For large hospitals a reconciliation of the sum of the counts for the four available bed types and an unduplicated establishment bed count is advisable.

Comments: This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Submitting organisation: Victorian Department of Human Services

Average available beds for overnight-stay patients

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Available bed—overnight-stay admitted care, average number of beds N[NNN.N]
METeOR identifier:	374151
Registration status:	Health, Standard 03/12/2008
Definition:	The number of beds available to provide overnight accommodation for patients (other than neonatal cots (non-special-care) and beds occupied by **hospital-in-the-home patients**), **averaged over the counting period**.
Context:	Public hospital establishments
Data Element Concept:	Available bed—overnight-stay admitted care

Value domain attributes

Representational attributes

Representation class:	Average
Data type:	Number
Format:	N[NNN.N]
Maximum character length:	5
Unit of measure:	Bed

Collection and usage attributes

Guide for use:	Average available beds, rounded to the nearest decimal or whole number.

Data element attributes

Collection and usage attributes

Guide for use:

The number of available beds should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily). If so it should be collected at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.

Inclusions: Both occupied and unoccupied beds are included in the count as they are deemed as available beds.

The number of beds available to provide overnight accommodation is recorded, e.g. maternity ward beds are counted but beds in the delivery suite are not. However, if in a delivery suite patients are admitted, deliver and are discharged from the same bed, such beds should be included because these beds are available for use for overnight-stay patients.

Exclusions: surgical tables, recovery trolleys, delivery beds, discharge lounges for patients who have been formally discharged, medi-hotel beds, beds exclusively or predominantly for same-day admitted care, neonatal cots (non-special-care), hospital-in-the home beds, and beds exclusively or predominantly for non-admitted patients (e.g. emergency trolleys) or residential care. No adjustment should be made for contracted services, either provided by, or to this hospital.

Collection methods:

Beds exclusively or predominantly for overnight-stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to its predominant use. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.
The assessment of availability must reflect the ability of the hospital to provide the necessary resources. This can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples.

Example 1: A large hospital, which conducts a daily bed count, has a ward containing 20 beds suitably equipped for overnight admitted patient care. The funding for this ward would allow an average of 15 beds to be staffed over the year. Provided demand is constant and there are no circumstances which prevent these beds from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available beds for this ward.

Example 2: A small hospital, which conducts a monthly bed count, is located in a summer holiday area and has 30 beds suitably equipped for overnight admitted patient care. It manages its resources in such a way that 30 beds are fully staffed during the four months from December to March, but only 15 beds are staffed during the remaining eight months from April to November. The annual average number of available beds is the average of the twelve counts – i.e. ((30 beds x 4 months) + (15 beds x 8 months) divided by 12 counting periods) = 20 beds.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 beds is closed for six months for a planned renovation. During this period a temporary 10 bed ward (B) is established and the necessary resources are provided. The annual average number of available beds for Ward A is the average of the twelve counts i.e. (20 beds X 6 months) + (0 beds X 6 months) divided by 12 counting periods = 10 beds. The annual average number of available beds for Ward B is (0 beds X 6 months) + (10 beds X 6 months) divided by 12 counting periods = 5 beds.

Example 4: A hospital conducts a daily bed count. A 20 bed ward is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 beds are available. So the average number of beds available for this ward in June is ((0 beds X 7 days) + (20 beds X 23 days) = 460/30 = 15.3.

Comments: This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Average available beds for residential mental health patients

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Available bed—residential mental health care, average number of beds N[NNN.N]

METeOR identifier: 373650

Registration status: Health, Standard 03/12/2008

Definition: The number of beds available in the **specialised residential mental health services** for overnight accommodation, **averaged over the counting period.**

Data Element Concept: Available bed—residential mental health care

Value domain attributes

Representational attributes

Representation class: Average

Data type: Number

Format: N[NNN.N]

Maximum character length: 5

Unit of measure: Bed

Collection and usage attributes

Guide for use: Average available beds, rounded to the nearest decimal or whole number.

Data element attributes

Collection and usage attributes

Guide for use: Residential mental health beds are available only if they are suitably located and equipped to provide residential mental health care and the necessary financial and human resources can be provided. Average available residential mental health beds are the average bed counts conducted during the year as required.

Inclusions: Both occupied and unoccupied residential mental health beds are included.

Collection methods:

Specialised residential mental health care services should establish clear recording and reporting practices and criteria that ensure that each available residential mental health bed is counted and that no available residential mental health bed is counted more than once.

The assessment of availability must reflect the ability of the specialised residential mental health care service to provide the necessary resources, and this can be significantly impacted by events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples.

Example 1: A specialised residential mental health care service containing 20 residential mental health beds (A) is closed for several months, either for a planned renovation or in response to an unplanned event such as a fire. During this period a temporary 10 specialised residential mental health bed facility (B) is established and the necessary resources are provided. The specialised residential mental health care service would not report the residential mental health beds in facility A, but it would report the 10 residential mental health beds in facility B.

Example 2: A 20 bed specialised residential mental health service is closed during the first week of February because of a strike, but for the remaining three weeks of February it is fully staffed so that all 20 residential mental health beds can be occupied during those three weeks. So the average number of residential mental health beds available for this service in February is 15.

Comments:

This data element is necessary to provide an indicator of the capacity of the residential service.

Average available beds for same-day patients

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Available bed—same-day admitted care, average number of beds N[NNN.N]

METeOR identifier: 373966

Registration status: Health, Standard 03/12/2008

Definition: The number of beds, chairs or trolleys available to provide accommodation for same-day patients, **averaged over the counting period**.

Data Element Concept: Available bed—same-day admitted care

Value domain attributes

Representational attributes

Representation class: Average

Data type: Number

Format: N[NNN.N]

Maximum character length: 5

Unit of measure: Bed

Collection and usage attributes

Guide for use: Average available beds, rounded to the nearest decimal or whole number.

Data element attributes

Collection and usage attributes

Guide for use: The number of beds, chairs or trolleys available to provide accommodation for same-day patients is recorded. Same-day patients are accommodated in the following ways:

1. Patients occupy a single bed or chair in a single location throughout their stay, e.g. dialysis or chemotherapy chair. In this situation the bed or chair is counted as a bed available for same-day patients.
2. Patients occupy a trolley which is moved to different locations throughout their stay – e.g. endoscopy suite, where patients move from the same-day ward to a

procedure room, onto a recovery room and back to the same-day ward. In this situation the trolley is counted as a bed available for same-day patients.

3. Same-day patients are accommodated in a general ward after being transferred from another area of the hospital (e.g. Emergency, another ward, etc). In this situation the beds may be counted as either overnight-stay or same-day according to their predominant use.

The number of available same day beds should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily) at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.

Inclusions: Both occupied and unoccupied beds are included. Beds, chairs or trolleys available, exclusively or predominantly intended to accommodate same-day admitted care or treatment. This includes day surgery beds, dialysis, chemotherapy, electro-convulsive therapy (ECT) and dental chairs for admitted patients.

Exclusions: Exclude beds, chairs or trolleys designated exclusively for same-day non-admitted patient care or predominantly used by non-admitted patients (e.g. emergency trolleys), medical ambulatory care, discharge lounges for patients who have been formally discharged, medi-hotel beds, hospital-in-the-home, neonatal cots (non-special-care), and beds for overnight-stay patients (even where overnight beds are used for unplanned same-day episodes e.g. patients who die or abscond on the day of admission). No adjustment should be made for contracted services, either provided by, or to this hospital.

Collection methods:

Beds exclusively or predominantly for overnight-stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special-care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to the most appropriate accommodation category. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.

The assessment of availability must reflect the ability of the hospital to provide the necessary resources, and this can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples:

Example 1: A large hospital, which conducts a daily bed count, has a ward containing 20 beds suitably equipped for same-day admitted patient care. The funding for this ward would allow an average of 15 beds to be staffed over the year. Provided demand is constant and there are no circumstances which prevent these beds from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available beds for this ward.

Example 2: A hospital located in a summer holiday area, which conducts monthly bed counts, has 12 beds suitably equipped for same-day admitted patient care. It manages its resources in such a way that 12 beds are fully staffed during the four months from December to March, but only 9 beds are staffed during the remaining eight months from April to November. The annual average number of available beds is the average of the twelve monthly averages, i.e. ((12 beds x 4 months) + (9 beds x 8 months) divided by 12 counting periods) = 120/12 = 10 beds.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 beds is closed for six months, for a planned renovation. During this period a temporary 10 bed ward (B) is established and the necessary resources are provided. The annual average number of available beds for Ward A is the average of the twelve counts, i.e. (20 beds X 6 months) + (0 beds X 6 months) divided by 12 counting periods = 120/12 = 10 beds. The annual average number of available beds for Ward B is (0 beds X 6 months) + (10 beds X 6 months) divided by 12 counting periods = 60/12 = 5 beds.

Example 4: A 20 bed ward is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 beds are available. So the average number of beds available for this ward in June is ((0 beds X 7 days) + (20 beds X 23 days) divided by 30 counting periods) = 460/30 = 15.3.

Comments: This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Technical name:	Available bed—neonatal admitted care (Non-special-care), average number of beds N[NNN.N]
METeOR identifier:	373640
Registration status:	Health, Standard 03/12/2008
Definition:	The number of cots available to provide neonatal accommodation, other than special care accommodation, **averaged over the counting period**.
Data Element Concept:	Available bed—neonatal admitted care (Non-special-care)

Value domain attributes

Representational attributes

Representation class:	Average
Data type:	Number
Format:	N[NNN.N]
Maximum character length:	5
Unit of measure:	Bed

Collection and usage attributes

Guide for use: Average available beds, rounded to the nearest decimal or whole number.

Data element attributes

Collection and usage attributes

Guide for use: Average available cots are the average of 12 monthly (or more frequent) counts of these available cots.

The number of available cots should be collected at least monthly at the same time on the same day. To improve accuracy data could be collected more frequently (e.g. daily). If so, it should be collected at the same time on each day. More frequent data collection is preferable if a single monthly count is likely to be significantly different from the monthly average.

Inclusions: neonatal cots which are not in an intensive care facility approved by the Commonwealth Health Minister for the purpose of the provision of special care. They accommodate unqualified newborns and may also accommodate qualified newborns who do not need to be treated in such a facility (e.g. healthy second twin).

Exclusions: cots in intensive care facilities approved by the Commonwealth Health Minister for the purpose of the provision of special care. Also exclude cots intended to accommodate older (not newborn) babies when they are admitted to hospital. (These cots are reported as available overnight beds.)

Collection methods:

Beds exclusively or predominantly for overnight stay admitted care, beds exclusively or predominantly for same-day admitted care and, if required, non-special care neonatal cots are to be collected and reported in separate categories. Hospitals should establish clear recording and reporting practices. Criteria should exist to ensure that each available bed is counted once and only once. A bed should first be assessed as available and then categorised to its predominant use. For large hospitals, a reconciliation of the sum of the bed types and an unduplicated establishment bed count is advisable.

The assessment of availability must reflect the ability of the hospital to provide the necessary resources. This can be significantly impacted by seasonal demand or events such as a strike, clinical staff shortage, fire or renovation. This is illustrated by the following examples.

Example 1: A large maternity hospital, which conducts a daily bed count, has a ward (not an approved intensive care facility) containing 20 cots used to accommodate newborns. The funding for this ward would allow an average of 15 cots to be staffed over the year. Provided demand is constant and there are no circumstances which prevent these cots from being available for patients, such as a strike, clinical staff shortage, fire or renovation, the hospital would report 15 available cots for this ward.

Example 2: A maternity hospital, which conducts a monthly bed count, has a ward (not an approved intensive care facility) containing 30 cots used to accommodate newborns. It manages its resources in such a way that it is staffed for 30 cots for four months of the year and staffed for 24 cots during the remaining eight months. The annual average number of available cots is the average of the twelve counts – i.e. (30 cots x 4 months) + (24 cots x 8 months) divided by 12 counting periods = (120 + 192)/12 = 26 cots.

Example 3: A hospital conducts a monthly bed count. Ward A containing 20 cots is closed for six months, for a planned renovation. During this period a temporary ward (B) containing 10 cots is established and the necessary resources are provided. The annual average number of available cots in Ward A is the average of the twelve counts, i.e. (20 cots X 6 months) + (0 cots X 6 months) divided by 12 counting periods = 10 cots. The annual average number of available cots for Ward B is (0 cots X 6 months) + (10 cots X 6 months) divided by 12 counting periods = 5 cots.

Example 4: A hospital conducts a daily bed count. A ward containing 20 cots is closed during the first week of June because of a strike, but for the remainder of June it is fully staffed so that all 20 cots are available. So the average number of cots available for this ward in June is ((0 cots X 7 days) + (20 cots X 23 days) = 460/30 = 15.3.

Comments: This data element is necessary to provide an indicator of the availability and type of service for an establishment.

Technical name:	Episode of care—behaviour-related risk factor intervention, code NN
METeOR identifier:	270165
Registration status:	Health, Standard 01/03/2005
Definition:	The intervention taken to modify or manage the patient's behaviour-related risk factor(s), as represented by a code.
Data Element Concept:	Episode of care—behaviour-related risk factor intervention

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:	Value	Meaning
	01	No intervention
	02	Information and education (not including written regimen)
	03	Counselling
	04	Pharmacotherapy
	05	Referral provided to a health professional
	06	Referral to a community program, support group or service
	07	Written regimen provided
	08	Surgery
	98	Other
Supplementary values:	99	Not stated/inadequately defined

Collection and usage attributes

Guide for use:

CODE 01 No intervention

Refers to no intervention taken with regard to the behaviour-related risk factor intervention-purpose.

CODE 02 Information and education (not including written regimen)

Refers to where there is no treatment provided to the patient for a behaviour-related risk factor intervention-purpose other than information and education.

CODE 03 Counselling

Refers to any method of individual or group counselling directed towards the behaviour-related risk factor intervention-purpose. This code excludes counselling activities that are part of referral options as defined in code 05 and 06.

CODE 04 Pharmacotherapy

Refers to pharmacotherapies that are prescribed or recommended for the management of the behaviour-related risk factor intervention-purpose.

CODE 05 Referral provided to a health professional

Refers to a referral to a health professional who has the expertise to assist the patient manage the behaviour-related risk factor intervention-purpose.

CODE 06 Referral to a community program, support group or service

Refers to a referral to community program, support group or service that has the expertise and resources to assist the patient manage the behaviour-related risk factor intervention-purpose.

CODE 07 Written regimen provided

Refers to the provision of a written regimen (nutrition plan, exercise prescription, smoking contract) given to the patient to assist them with the management of the behaviour-related risk factor intervention-purpose.

CODE 08 Surgery

Refers to a surgical procedure undertaken to assist the patient with the management of the behaviour-related risk factor intervention-purpose.

Collection and usage attributes

Guide for use: Plurality of a pregnancy is determined by the number of live births or by the number of fetuses that remain in utero at 20 weeks gestation and that are subsequently born separately. In multiple pregnancies, or if gestational age is unknown, only **live births** of any **birthweight** or gestational age, or fetuses weighing 400 g or more, are taken into account in determining plurality. Fetuses aborted before 20 completed weeks or fetuses compressed in the placenta at 20 or more weeks are excluded.

Collection methods: This data should be collected routinely for persons aged 28 days or less.

Birth weight

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Birth—birth weight, code N

METeOR identifier: 459938

Registration status: Health, Standard 07/12/2011

Definition: The first weight of the live-born or stillborn baby obtained after birth, or the weight of the neonate or infant on the date admitted if this is different from the date of birth, as represented by a code.

Data Element Concept: Birth—birth weight

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Low birth weight (less than 2,500 grams)
	2	Normal birth weight (2,500 grams to less than 4,500 grams)
	3	High birth weight (4,500 grams and over)
Supplementary values:	8	Unknown birth weight

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare (AIHW)

Data element attributes

Collection and usage attributes

Guide for use: For **live births**, **birthweight** should preferably be measured within the first hour of life before significant postnatal weight loss has occurred.

In perinatal collections the birthweight is to be provided for liveborn and stillborn babies.

Bleeding episode using TIMI criteria (status)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—bleeding episode status, Thrombolysis in Myocardial Infarction (TIMI) code N
METeOR identifier:	356725
Registration status:	Health, Standard 01/10/2008
Definition:	A person's episode of bleeding as described by the Thrombolysis In Myocardial Infarction (TIMI) criteria, as represented by a code.
Data Element Concept:	Person—bleeding episode status

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Major
	2	Minor
	3	Non TIMI bleeding
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Note in calculating the fall in haemoglobin or haematocrit, transfusion of whole blood or packed red blood cells is counted as 1g/dl (0.1g/l) haemoglobin or 3% absolute haematocrit.

CODE 1 Major

Overt clinical bleeding (or documented intracranial or retroperitoneal haemorrhage) associated with a drop in haemoglobin of greater than 5g/dl (0.5g/l) or a haematocrit of greater than 15% (absolute).

CODE 2 Minor

Overt clinical bleeding associated with a fall in haemoglobin of 3 or less than or equal to 5g/dl (0.5g/l) or a haematocrit of 9% to less than or equal to 15% (absolute).

CODE 3 Non TIMI Bleeding

Bleeding event that does not meet the major or minor definition.

Blindness (diabetes complication)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—blindness, code N

METeOR identifier: 270065

Registration status: Health, Standard 01/03/2005

Definition: Whether the individual has become legally blind in either or both eyes, as represented by a code.

Data Element Concept: Person—blindness

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Blindness - (
	2	Blindness - (
	3	Blindness - (
	4	No blindness
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 3 Blindness - (< 6/60) occurred in one eye within 12 months and in the other eye prior to the last 12 months

Blindness can be diagnosed in one eye within 12 months even though it has been previously diagnosed on the other eye.

Collection methods: Ask the individual if he/she has been diagnosed as legally blind (< 6/60) in both or either eye. If so record whether it has occurred within or prior to the last 12 months.

Alternatively determine blindness from appropriate documentation obtained from an ophthalmologist or optometrist.

Blood pressure—diastolic (measured)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—blood pressure (diastolic) (measured), millimetres of mercury NN[N]

METeOR identifier: 270072

Registration status: Health, Standard 01/03/2005

Definition: The person's diastolic **blood pressure,** measured in millimetres of mercury (mmHg).

Data Element Concept: Person—blood pressure (diastolic)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NN[N]

Maximum character length: 3

Supplementary values:

Value	Meaning
999	Not stated/inadequately described

Unit of measure: Millimetre of mercury (mmHg)

Data element attributes

Collection and usage attributes

Guide for use: The diastolic pressure is recorded as phase V Korotkoff (disappearance of sound) however phase IV Korotkoff (muffling of sound) is used if the sound continues towards zero but does not cease.

If Blood pressure - diastolic is not collected or not able to be collected, code 999.

Collection methods:

Measurement protocol for resting blood pressure:

The diastolic blood pressure is one component of a routine blood pressure measurement (i.e. systolic/diastolic) and reflects the minimum pressure to which the arteries are exposed.

- The patient should be relaxed and seated, preferably for several minutes, (at least 5 minutes). Ideally, patients should not take caffeine-containing beverages or smoke for two hours before blood pressure is measured.
- Ideally, patients should not exercise within half an hour of the measurement being taken (National Nutrition Survey User's Guide).
- Use a mercury sphygmomanometer. All other sphygmomanometers should be calibrated regularly against mercury sphygmomanometers to ensure accuracy.
- Bladder length should be at least 80%, and width at least 40% of the circumference of the mid-upper arm. If the velcro on the cuff is not totally attached, the cuff is probably too small.
- Wrap cuff snugly around upper arm, with the centre of the bladder of the cuff positioned over the brachial artery and the lower border of the cuff about 2 cm above the bend of the elbow.
- Ensure cuff is at heart level, whatever the position of the patient.
- Palpate the radial pulse of the arm in which the blood pressure is being measured.
- Inflate cuff to the pressure at which the radial pulse disappears and note this value. Deflate cuff, wait 30 seconds, and then inflate cuff to 30 mm Hg above the pressure at which the radial pulse disappeared.
- Deflate the cuff at a rate of 2-3 mm Hg/beat (2-3 mm Hg/sec) or less.
- Recording the diastolic pressure use phase V Korotkoff (disappearance of sound). Use phase IV Korotkoff (muffling of sound) only if sound continues towards zero but does not cease. Wait 30 seconds before repeating the procedure in the same arm. Average the readings.
- If the first two readings differ by more than 4 mmHg

diastolic or if initial readings are high, take several readings after five minutes of quiet rest.

Comments: The pressure head is the height difference a pressure can raise a fluid's equilibrium level above the surface subjected to pressure. (Blood pressure is usually measured as a head of Mercury, and this is the unit of measure nominated for this metadata item.)

The current (2002) definition of hypertension is based on the level of blood pressure above which treatment is recommended, and this depends on the presence of other risk factors, e.g. age, diabetes etc. (NHF 1999 Guide to Management of Hypertension).

Bodily location of main injury

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—bodily location of main injury, code NN

METeOR identifier: 268943

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: The bodily location of the injury chiefly responsible for the attendance of the person at the health care facility, as represented by a code.

Data Element Concept: Person—bodily location of main injury

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: NN

Maximum character length: 2

Permissible values:

Value	Meaning
01	Head (excludes face)
02	Face (excludes eye)
03	Neck
04	Thorax
05	Abdomen
06	Lower back (includes loin)
07	Pelvis (includes perineum, anogenital area

	and buttocks)
08	Shoulder
09	Upper arm
10	Elbow
11	Forearm
12	Wrist
13	Hand (include fingers)
14	Hip
15	Thigh
16	Knee
17	Lower leg
18	Ankle
19	Foot (include toes)
20	Unspecified bodily location
21	Multiple injuries (involving more than one bodily location)
22	Bodily location not required

Data element attributes

Collection and usage attributes

Guide for use:

If the full International Classification of Diseases - Tenth Revision - Australian Modification code is used to code the injury, this metadata item is not required (see metadata items Principal diagnosis and Additional diagnosis.

If any code from 01 to 12 or 26 to 29 in the metadata item Nature of main injury has been selected, the body region affected by that injury must be specified.

Select the category that best describes the location of the injury. If two or more categories are judged to be equally appropriate, select the one that comes first on the code list. A major injury, if present, should always be coded rather than a minor injury. If a major injury has been sustained (e.g. a fractured femur), along with one or more minor injuries (e.g. some small abrasions), the major injury should be coded in preference to coding 'multiple injuries'. As a general guide, an injury which, on its own, would be unlikely to have led to the attendance may be regarded as 'minor'. Bodily location of main injury is not required with other nature of main injury codes (code 22 may be used as a filler to indicate that a specific body region code is not required).

Comments:

The injury diagnosis is necessary for purposes including epidemiological research, casemix studies and planning. The nature of main injury together with the bodily location of the main injury indicates the diagnosis.

This metadata item is related to the ICD-10-AM injury and poisoning classification. However, coding to the full ICD-10-AM injury and poisoning classification (see metadata item Principal diagnosis is not available in most settings where basic injury surveillance is undertaken. This metadata item, in combination with the metadata item Nature of main injury is a practicable alternative. Data coded to the full ICD-10-AM codes can be aggregated to match this item, facilitating data comparison. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

Body function

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—body function, code (ICF 2001) AN[NNNN]
Synonymous names:	Body function code
METeOR identifier:	320141
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The physiological or psychological function of a person's body system, as represented by a code.
Data Element Concept:	Person—body function

Value domain attributes

Representational attributes

Classification scheme:	International Classification of Functioning, Disability and Health 2001
Representation class:	Code
Data type:	String
Format:	AN[NNNN]
Maximum character length:	6

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both Exercise tolerance functions (3 digit level) and 'fatigability' (4-digit level) as the former includes the latter.

The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with *Impairment extent code N* will use the codes as indicated.

CODE b1 Mental functions
CODE b2 Sensory functions and pain
CODE b3 Voice and speech functions
CODE b4 Functions of the cardiovascular, haematological, immunological and respiratory systems
CODE b5 Functions of the digestive, metabolic and the endocrine system
CODE b6 Genitourinary and reproductive functions
CODE b7 Neuromusculoskeletal and movement-related functions
CODE b8 Functions of the skin and related structures

Data collected at this level will provide a general description of the structures and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values together, with definitions is listed in the *Body Functions* component of the ICF.

An example of a value domain at the 3 digit level from the Sensory functions and pain chapter may include:

CODE b210 Seeing functions
CODE b230 Hearing functions
CODE b235 Vestibular functions
CODE b250 Taste functions
CODE b255 Smell functions
CODE b260 Proprioceptive functions
CODE b265 Touch functions
CODE b270 Sensory functions related to temperature and other stimuli
CODE b279 Additional sensory functions, other specified and unspecified

An example of a value domain at the 4 digit level from the body function component may include:

CODE b1300 Energy level
CODE b1400 Sustaining attention
CODE b1442 Retrieval of memory
CODE b1521 Regulation of emotion
CODE b1641 Organization and planning

The prefix ***b*** denotes the domains within the component of *Body Functions.*

Data element attributes

Collection and usage attributes

Guide for use: This data element can be used to record positive or neutral body function, as well as impairment of body function when used in conjunction with the metadata item Person—extent of impairment of body function, code (ICF 2001)N.

Where multiple body functions or impairments of body functions are recorded, the following prioritising system should be useful.

- The first recorded body function or impairment of body function is the one having the greatest impact on the individual.
- Second and subsequent body function or impairment of body function is also of relevance to the individual.

A person has not had their BMI recorded.

Comments:

Body mass index (BMI): A measure of an adult's weight (body mass) relative to height, used to assess the extent of weight deficit or excess where height and weight have been measured. Body mass index is the weight in kilograms divided by the square of the height in metres (WHO 2000).

Data element attributes

Collection and usage attributes

Guide for use: Formula: BMI = weight (kg) divided by height (m) squared.

Body mass index is a continuous variable.

Code body mass index to one or two decimal places (i.e. 99.99 or 99.9). If any component necessary for its calculation (i.e. weight or height for adults) is unknown or has not been collected, code to 888.8, 999.9.

Collection methods: NN.NN for BMI calculated from measured height and weight.

BMI should be derived after data entry of weight and height. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.

Comments: This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference such as the United States Centers for Disease Control 2000 BMI- for-age chart be used for in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th percentile would be classified as overweight, while a BMI greater than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults.

BMI is relatively easy to determine, and has been validated against more direct measures of adiposity such as Magnetic Resonance Imaging and Dual X-ray Absorptiometry.

BMI is a low cost technique, with low respondent and investigator burden. In addition, it offers low inter-observer and intra-observer error, therefore offering good reliability.

Overweight and obesity, as defined by the World Health Organisation (WHO) for the interpretation of BMI (WHO 2000), are exceedingly common in Australia and their prevalence is increasing.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles a sample size of at least 200 is recommended for each group for which the centiles are being specified.

Body mass index can be calculated from measured height and weight, or self-reported height and weight, however for children and adolescents, self-reported or parentally reported data should be used cautiously if at all.

For adults, body mass index tends to be underestimated when based on self-reported, rather than measured, height and weight. This is due to the fact that, on average, height tends to be overestimated and weight tends to be underestimated when self-reported by respondents.

There are many individuals for whom BMI is an inappropriate measure of body fatness. These are individuals whose high body mass is due to excess muscle rather than fat (e.g. body builders or others in whom the level of physical activity promotes an increase in muscle mass); or in those with osteoporosis who will have a lower than usual BMI; or those who have a different body build (e.g. individuals with unusually long or short legs or a different body fat distribution) (WHO Expert Committee 1995).

This is particularly important when assessing individuals but should also be taken into account in interpreting data from populations in which there are sub-groups with genetic or environmental differences in body build, composition, skeletal proportions or body fat distribution. As such, both BMI and a measure of fat distribution (waist circumference or waist: hip ratio) are important in calculating the risk of obesity comorbidities.

Epidemiological research shows that there is a strong association between BMI and health risk. Excess adipose tissue in adults is associated with excess morbidity and mortality from conditions such as hypertension, unfavourable blood lipid concentrations, diabetes mellitus, coronary heart disease, some cancers, gall bladder disease, and osteoarthritis. It may also lead to social and economic disadvantage as well as psychosocial problems. It is a major public health issue in most industrialised societies.

Thinness (low BMI) is also an indicator of health risk, often being associated with general illness, anorexia, cigarette smoking, drug addiction and alcoholism. Low BMI is consistently associated with increased risk of osteoporosis and fractures in the elderly.

Collection and usage attributes

Guide for use:

Adults:

Body mass index for adults cannot be calculated if components necessary for its calculation (weight or height) is unknown or has not been collected (i.e. is coded to 888.8 or 999.9).

BMI for adults is categorised according to the range it falls within as indicated by codes 1.1, 1.2, 2.1, 2.2, 3.1, 3.2, 3.3 or 9.9. For consistency, when the sample includes children and adolescents, adults can be analysed under the broader categories of 1, 2, 3 or 9 as used for categorising children and adolescents.

Children/adolescents:

Body mass index for children and adolescents aged 2 to 17 years cannot be calculated if components necessary for its calculation (date of birth, sex, weight or height) is unknown or has not been collected (i.e. is coded to 888.8, 999.9 or 9).

Self-reported or parentally reported height and weight for children and adolescents should be used cautiously if at all.

To determine overweight and obesity in children and adolescents, compare the derived BMI against those recorded for the relevant age and sex of the subject to be classified, against Table 1: Classification of BMI for children and adolescents, based on BMI cut-points developed by Cole et al (see below). For example, an 11 year old boy with a BMI of 21 would be considered overweight (i.e. coded as 2), or a 7 year old girl with a BMI of 17.5 would be considered not overweight or obese (i.e. coded as 1).

Using this method, children and adolescents can only be coded as 1, 2, 3 or 9.

Collection methods:

Use N for BMI category determined (1, 2, 3 or 9) for persons (children and adolescents) aged 2 to 17 years.

Use N.N for BMI category determined (1.1, 1.2, 2.1, 2.2, 3.1, 3.2, 3.3 or 9.9) for persons aged 18 years or older.

Standard definitions of overweight and obesity in terms of BMI are used to derive age-specific and age-adjusted indicators of overweight and obesity for reporting progress towards National public health policy .

Comments:

This metadata item applies to persons aged 2 years or older. It is recommended for use in population surveys and health care settings for adults and population surveys only for children and adolescents. It is recommended that calculated BMI for children and adolescents be compared with a suitable growth reference such as the US Centers for Disease Control 2000 BMI- for-age chart in health care settings such as hospitals, clinics and in general practice. A BMI greater than the 85th percentile would be classified as overweight, while a BMI greater than the 95th percentile would be classified as obese. These percentiles are arbitrary and do not relate to morbidity as the BMI cut-points do in adults.

BMI can be considered to provide the most useful, albeit crude, population-level measure of obesity. The robust nature of the measurements and the widespread routine inclusion of weights and heights in clinical and population health surveys mean that a more selective measure of adiposity, such as skinfold thickness measurements, provides additional rather than primary information. BMI can be used to estimate the prevalence of obesity within a population and the risks associated with it, but does not, however, account for the wide variation in the nature of obesity between different individuals and populations (WHO 2000).

BMI values for adults are age-independent and the same for both sexes.

However, BMI values for children and adolescents aged 2 to 17 years are age and sex specific and are classified by comparing against the above table, Table 1: Classification of BMI for children and adolescents.

For adults and children and adolescents BMI may not correspond to the same degree of fatness in different populations due, in part, to differences in body proportions. The classification table shows a simplistic relationship between BMI and the risk of comorbidity, which can be affected by a range of factors, including the nature of the diet, ethnic group and activity level. The risks associated with increasing BMI are continuous and graded and begin at a BMI of 25 (or equivalent to 25 for children and adolescents). The interpretation of BMI grades in relation to risk may differ for different populations. Both BMI and a measure of fat distribution (waist circumference or waist: hip ratio in adults) are important in calculating the risk of obesity comorbidities.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous Status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Methods used to establish cut-off points for overweight have been arbitrary and, as a result, cut-off points vary between countries. The data are derived mainly from studies of mortality and morbidity risk performed in people living in western Europe or the United States of America, and cut-off points for BMI as an indicator of adiposity and risk in populations who differ in body build and genetic disposition are likely to vary.

Caution is required in relation to BMI cut-off points when used for different ethnic groups because of limited outcome data for some ethnic groups, e.g. Aboriginal and Torres Strait Islander peoples. As with overweight the cut-off points for a given level of risk are likely to vary with body build, genetic background and physical activity.

The classification above is different to ones that have been used in the past and it is important that in any trend analysis consistent definitions are used.

BMI should not be rounded before categorisation to the classification above.

This item is only collected for persons aged 25 years and older.

Body structure

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—body structure, code (ICF 2001) AN[NNNN]

Synonymous names: Body structure code

METeOR identifier: 320147

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: An anatomical part of a person's body such as organs, limbs or their components, as represented by a code.

Data Element Concept: Person—body structure

Value domain attributes

Representational attributes

Classification scheme: International Classification of Functioning, Disability and Health 2001

Representation class: Code

Data type: String

Format: AN[NNNN]

Maximum character length: 6

Collection and usage attributes

Guide for use: This metadata item contributes to the definition of the concept **disability** and gives an indication of the experience of disability for a person.

Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both ‘Skin and related structures’ (chapter level) and ‘Structure of nails’ (3 digit level) as the former includes the latter.

The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with respective qualifiers (*Impairment extent code N*, *Impairment nature code N*, *Impairment location code N*) will use the codes as indicated.

CODE s1	Structures of the nervous system
CODE s2	The eye, ear and related structures
CODE s3	Structures involved in voice and speech
CODE s4	Structures of the cardiovascular, immunological and respiratory systems
CODE s5	Structures related to the digestive, metabolic and endocrine systems
CODE s6	Structures related to the genitourinary and reproductive systems
CODE s7	Structures related to movement
CODE s8	Skin and related structures

Data collected at this level will provide a general description of the structures and can only be compared with data collected at the same level.

Each chapter contains categories at different levels ordered from general to detailed. For more detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter. The full range of permissible values together with definitions is listed in the Body Structures component of the ICF.

An example of a value domain at the 3 digit level from the Structures of the nervous system chapter may include:

CODE s110	Structure of the brain
CODE s120	Spinal cord and related structures
CODE s130	Structure of the meninges
CODE s140	Structure of sympathetic nervous system
CODE s150	Structure of parasympathetic nervous system
CODE s198	Structure of the nervous system, other specified
CODE s199	Structure of the nervous system, unspecified

An example of a value domain at the 4 digit level from the Structures related to movement chapter may include:

CODE s7300	Structure of upper arm
CODE s7301	Structure of forearm
CODE s7302	Structure of hand
CODE s7500	Structure of thigh
CODE s7501	Structure of lower leg
CODE s7502	Structure of ankle and foot
CODE s7600	Structure of vertebral column

The prefix *s* denotes the domains within the component of *Body Structures*.

Reference documents: Further information on the ICF, including more detailed codes, can be found in the ICF itself and the ICF Australian User Guide (AIHW 2003), at the following websites:

- WHO ICF website http://www.who.int/classifications/icf/en/
- Australian Collaborating Centre ICF website http://www.aihw.gov.au/disability/icf/index.cfm

Data element attributes

Collection and usage attributes

Guide for use:

This data element consists of a single, neutral list of body structures that can be used to record positive or neutral body function. In conjunction with *Impairment extent code N*, it enables the provision of information about the presence and extent of impairment for any given body structures; with *Impairment nature code N*, the provision of information about the nature of the impairment for given body functions; and *Impairment location code N*, the location of the impairment for given body functions.

Where multiple body structures or **impairments of body structures** are recorded, the following prioritising system should be useful:

- The first recorded body structure or impairment of body function is the one having the greatest impact on the individual.
- Second and subsequent body structure or impairment of body function is also of relevance to the individual.

Bundle-branch block status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Electrocardiogram—bundle-branch block status, code N
METeOR identifier:	343866
Registration status:	Health, Standard 01/10/2008
Definition:	The bundle-branch block status identified on a person's electrocardiogram (ECG), as represented by a code.
Data Element Concept:	Electrocardiogram—bundle-branch block status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	Value	Meaning
	1	New
	2	Pre-existing
	3	Uncertain timing
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

To determine the bundle-branch block status, compare the current ECG to the preceding or most recently available ECG.

Collection methods:

Record for each ECG that indicates a bundle-branch block is present.

Only one bundle-branch block status can be recorded for each ECG performed.

Only one bundle-branch block can occur at any one time, but in any given person, a left bundle-branch block may occur at one time point and a right bundle-branch block at another time point. Therefore, there can only be one bundle-branch block per ECG, but they may differ temporally.

Relational attributes

Implementation in Data Set Specifications:

Electrocardiogram cluster Health, Standard 01/10/2008

Conditional obligation:
Record if a bundle-branch block has been detected on an electrocardiogram.

C-reactive protein level (measured)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—C-reactive protein level (measured), total milligrams per litre N[NN].N

Synonymous names: CRP measured

METeOR identifier: 338256

Registration status: Health, Standard 01/10/2008

Definition: A person's serum C-reactive protein (CRP) level, measured in milligrams per litre.

Data Element Concept: Person—C-reactive protein level (measured)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NN].N

Maximum character length: 4

Supplementary values:

Value	Meaning
999.9	Not stated/inadequately described

Unit of measure: Milligram per litre (mg/L)

Unit of measure precision: 1

Data element attributes

Collection and usage attributes

Comments: The value should be recorded on a high sensitivity assay.

CRP is used in the assessment of acute phase reaction in inflammatory, infective and neoplastic disorders.

Caesarean section indicator, last previous birth

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Female—caesarean section indicator (last previous birth) code N
METeOR identifier:	301993
Registration status:	Health, Standard 29/11/2006
Definition:	Whether a caesarean section was performed for the woman's last previous birth, as represented by a code.
Data Element Concept:	Female—caesarean section indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: This item should be completed if there has been a previous birth. In the case of no previous births, the item should be left blank.

Comments: Previous caesarean sections are associated with a higher risk of obstetric complications, and when used with other indicators provides important information on the quality of obstetric care.

This item can be used to determine vaginal births occurring after a caesarean section delivery (VBAC).

Cancer staging scheme source edition number

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer staging—cancer staging scheme source edition number, code N[N]

METeOR identifier: 393398

Registration status: Health, Standard 07/12/2011

Definition: The edition number of the cancer staging scheme used to determine the extent or stage of the cancer, as represented by a code.

Data Element Concept: Cancer staging—cancer staging scheme source edition number

Value domain attributes

Representational attributes

Representation class: Text

Data type: Number

Format: N[N]

Maximum character length: 2

Supplementary values:

Value	Meaning
97	Not applicable
98	Unknown
99	Not stated/inadequately described

Collection and usage attributes

Guide for use: Record the edition number, valid entries are from 1 to 96.

CODE 97 Not applicable

To be used for cases that do not have a recommended staging scheme or when the staging scheme source does not have edition number.

Source and reference attributes

Submitting organisation: Cancer Australia

Data element attributes

Collection and usage attributes

Guide for use: Record for any staging classification system that has an edition number. For example, record the edition number when the TNM Classification of Malignant Tumours (International Union Against Cancer (UICC)) or the American Joint Committee on Cancer (AJCC) Cancer Staging Manual is used for the purpose of staging the cancer.

Comments: Collected to identify the edition number of the staging scheme source. Cancer stage is an important determinant of treatment and prognosis, and is used to evaluate new treatments and analyse outcomes. Survival analysis is adjusted by stage at diagnosis and distribution of cancer cases by type and stage.

Cancer staging—stage grouping other

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—extent of primary cancer, stage grouping other, code X[XXXXX]
METeOR identifier:	393377
Registration status:	Health, Standard 07/12/2011
Definition:	The anatomical extent of disease in a person with cancer based on stage categories of a staging classification other than the standard TNM classification, as represented by a code.
Data Element Concept:	Person with cancer—extent of primary cancer

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	X[XXXXX]
Maximum character length:	6

Supplementary values:

Value	Meaning
999997	Not applicable
999998	Unknown
999999	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Record valid stage grouping codes from the current edition of the appropriate staging source for the particular cancer.

Convert all Roman numerals in the stage grouping to Arabic numbers. For example, stage IIIA would convert to 3A.

Data element attributes

Collection and usage attributes

Guide for use: Record the extent of the primary cancer at the time of diagnosis of the cancer.

Applies to all cancer stage groupings where a staging classification other than the standard TNM classification is used.

Choose the lower (less advanced) stage category when there is any uncertainty.

The relevant cancer stage grouping source will be indicated in the data element *Cancer staging-cancer staging scheme source, code N[N]* and if applicable, the related edition number will be recorded in data element *Cancer staging-cancer staging scheme source edition number, code N[N].*

A separate data element captures the extent of the primary cancer based on the TNM stage classification.

Collection methods: This information should be obtained from the patient's medical record.

Comments: Cancer stage is an important determinant of treatment and prognosis, and is used to evaluate new treatments and analyse outcomes. Survival analysis is adjusted by stage at diagnosis and distribution of cancer cases by type and stage.

Cancer staging—T stage code

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 7th ed) code X[XXX]
METeOR identifier:	403564
Registration status:	Health, Standard 07/12/2011
Definition:	The size and extent of the primary tumour in a person with cancer, as represented by a code.
Data Element Concept:	Person with cancer—primary tumour status

Value domain attributes

Representational attributes

Classification scheme:	International Union against Cancer (UICC) TNM Classification of Malignant Tumours 7th edition
Representation class:	Code
Data type:	String
Format:	X[XXX]
Maximum character length:	4

Supplementary values:

Value	Meaning
9997	Not applicable
9998	Unknown
9999	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Valid T codes from the current edition of the UICC TNM Classification of Malignant Tumours.

Record the stage in Arabic numerals and the appropriate upper or lower case alphabetic character omitting the prefix "T". For example, record stage T2a for lung cancer as "2a".

Record if the T stage value has a prefix of “c” or “p”; for example, record retinoblastoma T stage pT2b as “p2b”.

Refer to the TNM Supplement: A Commentary on Uniform Use, 3rd Edition for coding rules.

Source and reference attributes

Reference documents: Wittekind C et al (Editors) 2003. International Union Against Cancer (UICC): TNM supplement: A commentary on uniform use, 3rd edition. Wiley-Blackwell.

Data element attributes

Collection and usage attributes

Guide for use: Record the size and extent of the primary tumour at the time of diagnosis of the cancer.

TNM staging applies to solid tumours excluding brain tumours.

Choose the lower (less advanced) T category when there is any uncertainty.

The T stage value is derived from the size of the tumour and its relationship (extension) to other structures. The size is reflected in the value of data element *Person with cancer—solid tumour size (at diagnosis), total millimetres NNN*; the usage attributes provide additional detail.

The extent of the primary cancer at diagnosis is usually recorded. An exception is malignant melanoma of the skin; by convention T stage is recorded after tumour excision and is based on tumour thickness with T subcategories based on ulceration and the number of mitoses seen. Ovarian cancer is also surgically/pathologically staged.

The current edition of the American Joint Committee on Cancer (AJCC) Cancer Staging Manual provides an equivalent and alternative source of T stage codes.

Staging classification systems other than the TNM classification system are recorded separately.

Collection methods: This information should be obtained from the patient's medical record.

Comments: Cancer stage is an important determinant of treatment and prognosis, and is used to evaluate new treatments and analyse outcomes. Survival analysis is adjusted by stage at diagnosis and distribution of cancer cases by type and stage.

Data Element Concept:	Patient—cancer status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:	Value	Meaning
	1	No evidence of cancer
	2	Evidence of cancer
Supplementary values:	8	Unknown whether there is evidence of cancer
	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Record whether or not there is clinical evidence of cancer in the patient at the date of last contact or death.

Cancer status changes if the patient has a recurrence or relapse and the record should be updated.

The patient's cancer status should be changed only if new information is received from an official source. If information is obtained from the patient, a family member or other non-physician, then cancer status is not updated.

If the patient has multiple primary cancers, each primary should have the appropriate cancer status recorded.

For patients with hematopoietic disease who are in remission, code as 1-no evidence of this cancer.

Collection methods: This information should be collected from the patient's medical record.

Comments: This information is used for patient follow-up and outcome studies.

Cancer treatment type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—cancer treatment type, code N[N]
METeOR identifier:	399629
Registration status:	Health, Standard 07/12/2011
Definition:	The type of treatment administered during the initial course of treatment for cancer, as represented by a code.
Data Element Concept:	Cancer treatment—cancer treatment type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

	Value	Meaning
Permissible values:	Value	Meaning
	1	Surgery only
	2	Radiotherapy only
	3	Systemic agent therapy only
	4	Surgery and radiotherapy
	5	Surgery and systemic agent therapy
	6	Radiotherapy and systemic agent therapy
	7	Surgery, radiotherapy and systemic agent therapy
Supplementary values:	97	Not applicable—treatment was not administered
	98	Unknown whether treatment was administered
	99	Treatment was administered but the type was not stated/inadequately described

Collection and usage attributes

Guide for use:

More than one treatment type may be administered during the initial course of treatment; select the appropriate code value.

Systemic agent therapy includes:

- chemotherapy
- hormone therapy
- immunotherapy

Surgery includes:

- surgical procedure for cancer
- systemic therapy procedure involving surgery

A systemic therapy procedure is a medical, surgical or radiation procedure that has an effect on the hormonal or immunologic balance of the patient.

Treatments other than surgery, radiotherapy or systemic agent therapy administered as part of the initial course of treatment are recorded separately.

Source and reference attributes

Submitting organisation: Cancer Australia

Reference documents:

American College of Surgeons 2002. Facility Oncology Registry Data Standards (FORDS), 2009
revision. Commission on Cancer, 28E

Data element attributes

Collection and usage attributes

Guide for use:

All treatments administered to the patient during the initial course of cancer treatment should be recorded. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

When the patient has received treatment for cancer and codes 1 to 7 are recorded, the relevant treatment information for each treatment modality should also be collected.

Cancer-directed treatments administered to the patient during the initial course of treatment that cannot be characterised as surgery, radiotherapy or systemic therapy according to the definitions in this data set specification, are recorded separately in the data element *Cancer treatment—other cancer treatment, text [X(150)].*

Collection methods: This information should be obtained from the patient's medical record.

Comments: The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome.

Capital consumption expenses

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Organisation—capital consumption expenses, total Australian currency NNNNN.N
METeOR identifier:	376399
Registration status:	Health, Standard 01/04/2009
Definition:	Expenses of an organisation consisting of consumption of fixed capital (depreciation), in Australian currency.
Data Element Concept:	Organisation—capital consumption expenses

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Currency
Format:	NNNNN.N
Maximum character length:	6
Unit of measure:	Australian currency (AU$)

Source and reference attributes

Submitting organisation:	Health Expenditure Advisory Committee

Data element attributes

Collection and usage attributes

Guide for use:

Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.

Depreciation expenses are to be reported in millions to the nearest 100,000 e.g. $4,064,000 should be reported as $4.1 million.

When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).

Depreciation represents the expensing of a long-term asset over its useful life and is related to the basic accounting principle of matching revenue and expenses for the financial period. Depreciation charges for the current financial year only should be shown as expenditure. Where intangible assets are amortised (such as with some private hospitals) this should also be included in recurrent expenditure.

Collection methods: Depreciation expenses are to be reported for the *Health industry relevant organisation type* and *Type of health and health related functions* data elements.

Health industry relevant organisation type

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments: In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Cardiovascular medication (current)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—cardiovascular medication taken (current), code N

METeOR identifier: 270237

Registration status: Health, Standard 01/03/2005

Definition: Whether the individual is currently taking cardiovascular medication, as represented by a code.

Data Element Concept: Person—cardiovascular medication taken

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Angiotensin converting enzyme (ACE) inhibitors
	2	Angiotensin II (A2) receptor blockers
	3	Beta blockers
	4	Calcium antagonists
	8	None of the above
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 1 Angiotensin converting enzyme (ACE) inhibitors

Use this code for ACE inhibitors (captopril, enalapril, fosinopril, lisinopril, perindopril, quinapril, ramipril and trandolapril).

CODE 2 Angiotensin II (A2) receptor blockers

Use this code for Angiotensin II receptor blockers (candesartan, eprosartan, irbesartan and telmisartan).

CODE 3 Beta blockers

Use this code for Beta blockers (atenolol, carvedilol, labetalol, metoprolol, oxprenolol, pindolol, propranolol and sotalol).

CODE 4 Calcium antagonists

Use this code for Calcium antagonists (amlodipine, diltiazem, felodipine, lercanidipine, nifedipine and verapamil).

CODE 8 None of the above

This code is used when none of the listed medications is being taken by the person.

CODE 9 Not stated/inadequately described

This code should only be used in situations where it is not practicable to ask the questions.

Collection methods: The person should be asked a series of questions about any current medication for a cardiovascular condition as follows:

Are you currently taking any medication for a cardiovascular condition?

___Yes ___No

If the person answers 'NO', then code 8 should be applied.

If the person answers 'YES', then ask which one(s) (from the list of drugs in the Guide for use).

Ace Inhibitors ___Yes ___No

Angiotensin II receptor blockers ___Yes ___No

Beta blockers ___Yes ___No

Calcium antagonists ___Yes ___No

The appropriate code should be recorded for each type of medication currently in use.

Data element attributes

Collection and usage attributes

Collection methods: A person may be taking one or more of the following medications for a cardiovascular condition. Therefore more than one code may be reported.

Source and reference attributes

Data Element Concept: Hospital service—care type

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N[N].N

Maximum character length: 3

Permissible values:

Value	Meaning
1.0	Acute care (Admitted care)
2.0	Rehabilitation care (Admitted care)

2.1	Rehabilitation care delivered in a designated unit (optional)
2.2	Rehabilitation care according to a designated program (optional)
2.3	Rehabilitation care is the principal clinical intent (optional)
3.0	Palliative care
3.1	Palliative care delivered in a designated unit (optional)
3.2	Palliative care according to a designated program (optional)
3.3	Palliative care is the principal clinical intent (optional)
4.0	Geriatric evaluation and management
5.0	Psychogeriatric care
6.0	Maintenance care
7.0	Newborn care
8.0	Other admitted patient care
9.0	Organ procurement - posthumous (Other care)
10.0	Hospital boarder (Other care)

Collection and usage attributes

Guide for use:

Persons with mental illness may receive any one of the care types (except newborn and organ procurement). Classification depends on the principal clinical intent of the care received.

Admitted care can be one of the following:

CODE 1.0 Acute care (Admitted care)

Acute care is care in which the clinical intent or treatment goal is to:

- manage labour (obstetric)
- cure illness or provide definitive treatment of injury
- perform surgery
- relieve symptoms of illness or injury (excluding palliative care)
- reduce severity of an illness or injury

- protect against exacerbation and/or complication of an illness and/or injury which could threaten life or normal function
- perform diagnostic or therapeutic procedures.

CODE 2.0 Rehabilitation care (Admitted care)

Rehabilitation care is care in which the clinical intent or treatment goal is to improve the functional status of a patient with an impairment, disability or handicap. It is usually evidenced by a multi-disciplinary rehabilitation plan comprising negotiated goals and indicative time frames which are evaluated by a periodic assessment using a recognised functional assessment measure. It includes care provided:

- in a designated rehabilitation unit (code 2.1), or
- in a designated rehabilitation program, or in a psychiatric rehabilitation program as designated by the state health authority for public patients in a recognised hospital, for private patients in a public or private hospital as approved by a registered health benefits organisation (code 2.2), or
- under the principal clinical management of a rehabilitation physician or, in the opinion of the treating doctor, when the principal clinical intent of care is rehabilitation (code 2.3).

Optional:

CODE 2.1 Rehabilitation care delivered in a designated unit (optional)

A designated rehabilitation care unit is a dedicated ward or unit (and can be a stand-alone unit) that receives identified funding for rehabilitation care and/or primarily delivers rehabilitation care.

CODE 2.2 Rehabilitation care according to a designated program (optional)

In a designated rehabilitation care program, care is delivered by a specialised team of staff who provide rehabilitation care to patients in beds that may or may not be dedicated to rehabilitation care. The program may, or may not be funded through identified rehabilitation care funding. Code 2.1 should be used instead of code 2.2 if care is being delivered in a designated rehabilitation care program and a designated rehabilitation care unit.

CODE 2.3 Rehabilitation care is the principal clinical intent (optional)

Rehabilitation as principal clinical intent (code 2.3) occurs when the patient is primarily managed by a medical practitioner who is a specialist in rehabilitation care or when, in the opinion of the treating medical practitioner, the care provided is rehabilitation care even if the doctor is not a rehabilitation care specialist. The exception to this is when the medical practitioner is providing care within a designated unit or a designated program, in which case code 2.1 or 2.2 should be used, respectively.

Code 3.0 Palliative care

Palliative care is care in which the clinical intent or treatment goal is primarily quality of life for a patient with an active, progressive disease with little or no prospect of cure. It is usually evidenced by an interdisciplinary assessment and/or management of the physical, psychological, emotional and spiritual needs of the patient; and a grief and bereavement support service for the patient and their carers/family. It includes care provided:

- in a palliative care unit (code 3.1); or
- in a designated palliative care program (code 3.2); or
- under the principal clinical management of a palliative care physician or, in the opinion of the treating doctor, when the principal clinical intent of care is palliation (code 3.3).

Optional:

CODE 3.1 Palliative care delivered in a designated unit (optional)

A designated palliative care unit is a dedicated ward or unit (and can be a stand-alone unit) that receives identified funding for palliative care and/or primarily delivers palliative care.

CODE 3.2 Palliative care according to a designated program (optional)

In a designated palliative care program, care is delivered by a specialised team of staff who provide palliative care to patients in beds that may or may not be dedicated to palliative care. The program may, or may not be funded through identified palliative care funding. Code 3.1 should be used instead of code 3.2 if care is being delivered in a designated palliative care program and a designated palliative care unit.

CODE 3.3 Palliative care is the principal clinical intent (optional)

Palliative care as principal clinical intent occurs when the patient is primarily managed by a medical practitioner who is a specialist in palliative care or when, in the opinion of the treating medical practitioner, the care provided is palliative care even if the doctor is not a palliative care specialist. The exception to this is when the medical practitioner is providing care within a designated unit or a designated program, in which case code 3.1 or 3.2 should be used, respectively. For example, code 3.3 would apply to a patient dying of cancer who was being treated in a geriatric ward without specialist input by palliative care staff.

CODE 4.0 Geriatric evaluation and management

Geriatric evaluation and management is care in which the clinical intent or treatment goal is to maximise health status and/or optimise the living arrangements for a patient with multi-dimensional medical conditions associated with disabilities and psychosocial problems, who is usually (but not always) an older patient. This may also include younger adults with clinical conditions generally associated with old age. This care is usually evidenced by multi-disciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames. Geriatric evaluation and management includes care provided:

- in a geriatric evaluation and management unit; or
- in a designated geriatric evaluation and management program; or
- under the principal clinical management of a geriatric evaluation and management physician or,
- in the opinion of the treating doctor, when the principal clinical intent of care is geriatric evaluation and management.

CODE 5.0 Psychogeriatric care

Psychogeriatric care is care in which the clinical intent or treatment goal is improvement in health, modification of symptoms and enhancement in function, behaviour and/or quality of life for a patient with an age-related organic brain impairment with significant behavioural or late onset psychiatric disturbance or a physical condition accompanied by severe psychiatric or behavioural disturbance. The care is usually evidenced by multi-disciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames. It includes care provided:

- in a psychogeriatic care unit;
- in a designated psychogeriatic care program; or

- under the principal clinical management of a psychogeriatic physician or,
- in the opinion of the treating doctor, when the principal clinical intent of care is psychogeriatic care.

CODE 6.0 Maintenance care

Maintenance care is care in which the clinical intent or treatment goal is prevention of deterioration in the functional and current health status of a patient with a disability or severe level of functional impairment. Following assessment or treatment the patient does not require further complex assessment or stabilisation, and requires care over an indefinite period. This care includes that provided to a patient who would normally receive care in another setting, e.g. at home, or in a residential aged care service, by a relative or carer, that is unavailable in the short term.

CODE 7.0 Newborn care

Newborn care is initiated when the patient is born in hospital or is nine days old or less at the time of admission. Newborn care continues until the care type changes or the patient is separated:

- patients who turn 10 days of age and do not require clinical care are separated and, if they remain in the hospital, are designated as boarders
- patients who turn 10 days of age and require clinical care continue in a newborn episode of care until separated
- patients aged less than 10 days and not admitted at birth (e.g. transferred from another hospital) are admitted with newborn care type
- patients aged greater than 9 days not previously admitted (e.g. transferred from another hospital) are either boarders or admitted with an acute care type
- within a newborn episode of care, until the baby turns 10 days of age, each day is either a qualified or unqualified day
- a newborn is qualified when it meets at least one of the criteria detailed in **Newborn qualification status**.

Within a newborn episode of care, each day after the baby turns 10 days of age is counted as a qualified patient day. Newborn qualified days are equivalent to acute days and may be denoted as such.

CODE 8.0 Other admitted patient care

Other admitted patient care is care where the principal clinical intent does meet the criteria for any of the above.

Other care can be one of the following:

CODE 9.0 Organ procurement - posthumous (Other care)

Organ procurement - posthumous is the procurement of human tissue for the purpose of transplantation from a donor who has been declared brain dead.

Diagnoses and procedures undertaken during this activity, including mechanical ventilation and tissue procurement, should be recorded in accordance with the relevant ICD-10-AM Australian Coding Standards. These patients are not admitted to the hospital but are registered by the hospital.

CODE 10.0 Hospital boarder (Other care)

Hospital boarder is a person who is receiving food and/or accommodation but for whom the hospital does not accept responsibility for treatment and/or care.
Hospital boarders are not admitted to the hospital. However, a hospital may register a boarder. Babies in hospital at age 9 days of less cannot be boarders. They are admitted patients with each day of stay deemed to be either qualified or unqualified.

Comments: Unqualified newborn days (and separations consisting entirely of unqualified newborn days) are not to be counted under the Australian Health Care Agreements, and they are ineligible for health insurance benefit purposes.

4	Psychogeriatric care
8	Other care

Collection and usage attributes

Guide for use:

Subacute care is defined as rehabilitation, palliative care, geriatric evaluation and management, and psychogeriatric care.

CODE 1 Rehabilitation care

Rehabilitation care is care in which the clinical intent or treatment goal is to improve the functional status of a patient with an impairment, disability or handicap. It is usually evidenced by a interdisciplinary rehabilitation plan comprising negotiated goals and indicative time frames which are evaluated by a periodic assessment using a recognised functional assessment measure.

CODE 2 Palliative care

Palliative care is care in which the clinical intent or treatment goal is primarily quality of life for a patient with an active, progressive disease with little or no prospect of cure. It is usually evidenced by an interdisciplinary assessment and/or management of the physical, psychological, emotional and spiritual needs of the patient; and the provision of grief and bereavement support for the patient and their carers/family.

CODE 3 Geriatric evaluation and management (GEM)

Geriatric evaluation and management is care in which the clinical intent or treatment goal is to maximise the health status and/or optimise the living arrangements for a patient with multi-dimensional medical conditions associated with disabilities and psychosocial problems, who is usually (but not always) an older patient. This may also include younger adults with clinical conditions generally associated with old age. This care is usually evidenced by interdisciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames.

CODE 4 Psychogeriatric care

Psychogeriatric care is care in which the clinical intent or treatment goal is improvement in health, modification of symptoms and enhancement in function, behaviour and/or quality of life for a patient with an age-related organic brain impairment with significant behavioural or late onset psychiatric disturbance or a physical condition accompanied by severe psychiatric or behavioural disturbance. The care is usually evidenced by interdisciplinary management and regular assessments against a management plan that is working towards negotiated goals within indicative time frames.

CODE 8 Other care

Any care provided that does not fall within the categories above. e.g. maintenance care, and acute care.

NOTE: Interdisciplinary care is care provided by a multidisciplinary team.

Data element attributes

Collection and usage attributes

Guide for use: In addition to the definitions within the value domain, further clarifying information is provided below.

Rehabilitation care includes care provided:

- in a designated rehabilitation unit (i.e. a dedicated unit that receives identified funding for rehabilitation care and/or primarily delivers rehabilitation care); or
- according to a designated rehabilitation program (i.e. care is delivered by a specialised team of staff who are dedicated to rehabilitation care); or
- under the principal clinical management of a rehabilitation physician or related healthcare worker; or
- where the care requested is rehabilitation care.

Palliative care includes care provided:

- in a designated palliative care unit (i.e. a dedicated unit that receives identified funding for palliative care and/or primarily delivers palliative care); or
- according to a designated palliative care program (i.e. care is delivered by a specialised team of staff who are dedicated to palliative care); or
- under the principal clinical management of a palliative care physician or related healthcare worker; or
- where the care requested is palliative care.

Geriatric evaluation and management (GEM) includes care provided:

- in a geriatric evaluation and management unit (i.e. a dedicated unit that receives identified funding for GEM and/or primarily delivers GEM); or
- in a designated geriatric evaluation and management program (i.e. care is delivered by a specialised team of staff who are dedicated to GEM); or
- under the principal clinical management of a geriatric evaluation and management physician or related healthcare worker; or
- where the care requested is geriatric evaluation and management.

Psychogeriatric care includes care provided:

- in a psychogeriatric care unit (i.e. a dedicated unit that receives identified funding for psychogeriatric care and/or primarily delivers psychogeriatric care); or
- in a designated psychogeriatric care program (i.e. care is delivered by a specialised team of staff who are dedicated to psychogeriatric care); or
- under the principal clinical management of a psychogeriatric physician or related healthcare worker; or
- where the care requested is psychogeriatric care.

Collection methods: Classification depends on an assessment of the overall nature of care provided, based on other service event characteristics collected at the jurisdiction level such as clinic type, provider type and/or referral details. The method used to derive the care type should be submitted with the dataset.

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

A person is considered to have carer responsibility if the person is:

- the main provider of ongoing help and supervision in the core activities of daily living for the individual in need of care, and

- has ongoing responsibilities for safeguarding the health and welfare of the individual needing care.

Carer responsibility can be split or shared between several parties. This may include custodians, foster carers, guardians and other relations such as spouses and kin.

A person with carer responsibility does not necessarily live with the person in need of care.

	3	Cataract currently present or has been previously removed from both eyes
	4	No cataract present or has not been previously removed from either eye
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Collection methods: Examination of the lens of the eye through a dilated pupil (visible through the pupil by the use of an ophthalmoscope) by an ophthalmologist or optometrist, as a part of the ophthalmological assessment.

Ask the individual if he/she has a cataract in either or both eyes or has had a cataract removed from either or both eyes previously. Alternatively obtain information from an ophthalmologist or optometrist or from appropriate documentation.

Comments: Cataract is a clouding of the lens of the eye or its capsule sufficient to reduce vision. The formation of cataract occurs more rapidly in patients with a history of ocular trauma, uveitis, or diabetes mellitus. Cataract is an associated diabetic eye problem that could lead to blindness.

Regular eye checkups are important for patients suffering from diabetes mellitus. This helps to early detect abnormalities and to avoid or postpone vision-threatening complications. A comprehensive ophthalmological examination includes:

- check visual acuity with Snellen chart -correct with pinhole if indicated
- examine for cataract
- examine fundi with pupils dilated.

Collection and usage attributes

Guide for use:	The CRN should only be collected from persons eligible to receive health services that are to be funded by Centrelink. The number may be reported to a Centrelink agency to reconcile payment for the service provided. The data should not be used by private sector organisations for any purpose unless specifically authorised by law. For example, data linkage should not be carried out unless specifically

authorised by law.

Collection methods: The Centrelink Customer Reference Number (CRN) is provided on 'Health Care Cards' and 'Pensioner Concession Cards'.

Comments: When a person accesses health services on the basis of being a Centrelink customer, collection of the CRN is usually necessary. This data should not be collected and recorded if it is not needed to support the provision of such health services.

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Comments:

Currently, the screening test for cervical cancer is the Pap test (the terms Pap test and Pap smear are often used interchangeably), which is carried out by a general practitioner, nurse, or gynaecologist. During a Pap test, cells are collected from the surface of the cervix, transferred onto a slide or into a special liquid, and sent to a pathology laboratory for assessment. Details of the woman, the Pap test results, and any follow-up that may be recommended are then stored on a cervical cytology register (AIHW 2009).

Early detection and treatment of cervical cancer leads to a reduction of morbidity and mortality due to the disease. It is recommended that women aged 18-69 years, who have ever had sex, have a cervical screening every two years (DOHA 2006).

Classification scheme:	International Classification of Functioning, Disability and Health 2001
Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:		
	0	No change in structure
	1	Total absence
	2	Partial absence
	3	Additional part
	4	Aberrant dimensions
	5	Discontinuity
	6	Deviating position
	7	Qualitative changes in structure
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

Impairments of body structure are problems in body structure such as a loss or significant departure from population standards or averages.

CODE 0 No change in structure

Used when the structure of the body part is within the range of the population standard.

CODE 1 Total absence

Used when the body structure is not present. For example total absence of the structures of the lower leg following a thorough knee amputation.

CODE 2 Partial absence

Used when only part of a body structure is present. For example partial absence of the bones of the lower leg following below knee amputation.

CODE 3 Additional part

Used when a structure, not usually present in the population is present, for example a sixth lumbar vertebra or an sixth digit on one hand.

CODE 4 Aberrant dimensions

Used when the shape and size of a body structure is significantly different from the population standard. For example radial aplasia where the shape and size of the radial bone does not develop.

CODE 5 Discontinuity

Used when parts of a body structure are separated, for example cleft palate or fracture.

CODE 6 Deviating position

Used when the location of a structure is not according to population standard; for example, transposition of the great vessels, where the aorta arises from the right ventricle and the pulmonary vessels from the left ventricle.

CODE 7 Qualitative changes in structure

Used when the structure of a body part is altered from the population standard. This includes accumulation of fluid, changes in bone structure as a result of osteoporosis or Paget's disease.

CODE 8 Not specified

Used when there is a change to a body structure, but the nature of the change is not described.

CODE 9 Not applicable

Used when it is not appropriate to code the nature of the change to a body structure.

Chemotherapy completion date

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—chemotherapy completion date, DDMMYYYY
METeOR identifier:	393552
Registration status:	Health, Standard 07/12/2011
Definition:	The completion date of **chemotherapy** administered during the initial course of treatment for cancer, expressed as DDMMYYYY.
Data Element Concept:	Cancer treatment—chemotherapy completion date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Chemotherapy is cancer treatment that achieves its antitumour effect through the use of antineoplastic drugs that inhibit the reproduction of cancer cells by interfering with DNA synthesis and mitosis.

The completion date of chemotherapy is the date the last dose was administered during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The completion date of chemotherapy is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of the chemotherapy.

Multiple entries are not permitted.

Dates relating to targeted therapies using a chemotherapy agent are included. Targeted therapies are treatments that use drugs or other substances to identify and attack specific cancer cells.

Dates of surgery, radiotherapy and other systemic treatments are collected as separate items. However, if a patient receives treatment with a protocol that includes different types of systemic therapy agents, for example, a chemotherapy agent and a hormone therapy agent, record the completion date of treatment in both relevant data items.

Collection methods: The information should be obtained from the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Source and reference attributes

Chemotherapy cycles administered

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—chemotherapy cycles administered, number of cycles N[NN]
METeOR identifier:	393814
Registration status:	Health, Standard 07/12/2011
Definition:	The total number of cycles of **chemotherapy** administered during the initial course of treatment for cancer.
Data Element Concept:	Cancer treatment—chemotherapy cycles administered

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3

Supplementary values:

Value	Meaning
997	Not applicable-no chemotherapy was administered
998	Unknown whether chemotherapy was administered
999	Chemotherapy was administered but the number of cycles was not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Chemotherapy is a type of cancer treatment that achieves its antitumour effect through the use of antineoplastic drugs that inhibit the reproduction of cancer cells by interfering with DNA synthesis and mitosis.

Chemotherapy may be administered as single-agent treatment or as a combination of drugs administered according to a prespecified regimen or protocol.

The number of cycles of each course of single agent chemotherapy, regimen or protocol administered to the patient during the initial treatment of cancer should be recorded separately. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The number of cycles of chemotherapy received is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of the chemotherapy.

If any part of a cycle is administered but the cycle is not completed, record as one cycle.

Oral chemotherapy normally given on an outpatient basis should also be included.

The number of cycles of targeted therapies using a chemotherapy agent is included. Targeted therapies are treatments that use drugs or other substances to identify and attack specific cancer cells.

If a patient receives treatment with a protocol including both a chemotherapy agent and another systemic agent such as an immunotherapy or hormone therapy agent, record the number of cycles here.

Collection methods: This information should be collected from the patient's medical record.

Comments: The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome.

Chest pain pattern category

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—chest pain pattern, code N
METeOR identifier:	356738
Registration status:	Health, Standard 01/10/2008
Definition:	The person's chest pain pattern, as represented by a code.
Data Element Concept:	Person—chest pain pattern

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:	Value	Meaning
	1	Atypical chest pain
	2	Stable chest pain pattern
	3	Unstable chest pain pattern: rest &/or prolonged
	4	Unstable chest pain pattern: new & severe
	5	Unstable chest pain pattern: accelerated & severe
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:	Chest pain or discomfort of myocardial ischaemic origin is usually described as pain, discomfort or pressure in the chest or the upper body (neck and throat, jaw, shoulders, back, either or both arms, wrists and hands) or other equivalent discomfort suggestive of cardiac ischaemia. Ask the person when the symptoms first occurred or obtain this information from appropriate documentation.

CODE 1 Atypical chest pain

Use this code for pain, pressure, or discomfort in the chest, or upper body not clearly exertional or not otherwise consistent with pain or discomfort of myocardial ischaemic origin.

CODE 2 Stable chest pain pattern

Use this code for chest pain without a change in frequency or pattern for the 6 weeks before this presentation or procedure. Chest pain is controlled by rest and/or sublingual/oral/transcutaneous medications.

CODE 3 Unstable chest pain pattern: rest and/or prolonged

Use this code for chest pain that occurred at rest and was prolonged, usually lasting for at least 10 minutes

CODE 4 Unstable chest pain pattern: new and severe

Use this code for new-onset chest pain that could be described as at least Canadian Cardiovascular Society (CCS) classification 3 severity.

CODE 5 Unstable chest pain pattern: accelerated and severe

Use this code for recent acceleration of chest pain pattern that could be described by an increase in severity of at least 1 CCS class to at least CCS class 3.

Cholesterol—HDL (measured)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—high-density lipoprotein cholesterol level (measured), total millimoles per litre [N].NN
METeOR identifier:	270401
Registration status:	Health, Standard 01/03/2005
Definition:	A person's high-density lipoprotein cholesterol (HDL-C), measured in mmol/L.
Data Element Concept:	Person—high-density lipoprotein cholesterol level

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	[N].NN
Maximum character length:	3

Supplementary values:

Value	Meaning
9.99	Not measured/inadequately described

Unit of measure: Millimole per litre (mmol/L)

Data element attributes

Collection and usage attributes

Guide for use:

When reporting, record whether or not the measurement of High-density Lipoprotein Cholesterol (HDL-C) was performed in a fasting specimen.

In settings where the monitoring of a person's health is ongoing and where a measure can change over time (such as general practice), the date of assessment should be recorded.

Collection methods:

When reporting, record absolute result of the most recent HDL-Cholesterol measurement in the last 12 months to the nearest 0.01 mmol/L.

Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities.

- To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.
- Prolonged tourniquet use can artefactually increase levels by up to 20%.

Cholesterol—LDL (calculated)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—low-density lipoprotein cholesterol level (calculated), total millimoles per litre N[N].N
METeOR identifier:	359262
Registration status:	Health, Standard 01/10/2008
Definition:	A person's calculated low-density lipoprotein cholesterol (LDL-C) in millimoles per litre.
Data Element Concept:	Person—low-density lipoprotein cholesterol level

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N].N
Maximum character length:	3

Supplementary values:

Value	Meaning
99.9	Not stated/inadequately described

Unit of measure: Millimole per litre (mmol/L)

Data element attributes

Collection and usage attributes

Guide for use:

Formula:

LDL-C = (plasma total cholesterol) - (high density lipoprotein cholesterol) - (fasting plasma triglyceride divided by 2.2).

Collection methods:

The LDL-C is usually calculated from the Friedwald Equation (Friedwald et al. 1972), which depends on knowing the blood levels of the total cholesterol and HDL-C and the fasting level of the triglyceride.

Note that the Friedwald equation becomes unreliable when the plasma triglyceride exceeds 4.5 mmol/L.

Note also that while cholesterol levels are reliable for the first 24 hours after the onset of acute coronary syndromes, they may be unreliable for the subsequent 8 weeks after an event.

- Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities.
- To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.

Comments: High blood cholesterol is a key factor in heart, stroke and vascular disease, especially coronary heart disease (CHD).

Poor nutrition can be a contributing factor to heart, stroke and vascular disease as a population's level of saturated fat intake is the prime determinant of its level of blood cholesterol.

The majority of the cholesterol in plasma is transported as a component of LDL-C. Recent trials support a target LDL-C of <2.0 mmol/L for high risk patients with existing coronary heart disease.

	99.9	Not stated/inadequately described.
Unit of measure:	Millimole per litre (mmol/L)	

Data element attributes

Collection and usage attributes

Guide for use:

Measurement in mmol/L to 1 decimal place.

Record the absolute result of the total cholesterol measurement. When reporting, record whether or not the measurement of Cholesterol-total - measured was performed in a fasting specimen.

Collection methods: When reporting, record absolute result of the most recent Cholesterol-total - measured in the last 12 months to the nearest 0.1 mmol/L.

Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities.

- To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.
- Prolonged tourniquet use can artefactually increase levels by up to 20%.

Comments: In settings where the monitoring of a person's health is ongoing and where a measure can change over time (such as general practice), the Service contact—service contact date, DDMMYYYY should be recorded.

High blood cholesterol is a key factor in heart, stroke and vascular disease, especially coronary heart disease.

Poor nutrition can be a contributing factor to heart, stroke and vascular disease as a population's level of saturated fat intake is the prime determinant of its level of blood cholesterol.

Large clinical trials have shown that people at highest risk of cardiovascular events (e.g. pre-existing ischaemic heart disease) will derive the greatest benefit from lipid lowering drugs. Recent trials have suggested that there should be no cholesterol level threshold for the initiation of treatment in tis group of patients. In October 2006, the PBS criteria for lipid-lowering drugs was expanded to include all patients identified as high-risk (based on PBS criteria) regardless of their cholesterol level.

A person has a chronic obstructive pulmonary disease (COPD) recorded on their clinical record.

CODE 2 No

A person does not have a chronic obstructive pulmonary disease (COPD) recorded on their clinical record.

Chronic obstructive pulmonary disease (COPD) encompasses a number of conditions which obstruct airflow to the lungs, and individual diseases are classified as COPD or not by Patient Information Retrieval (PIRS) systems.

described/not stated

Data element attributes

Collection and usage attributes

Comments:	Position or job classifications are specific to each profession and may differ by state or territory. The classifications above are simplified so that comparable data presentation is possible and possible confounding effects of enterprise specific structures are avoided. For example, for medicine, the job classification collected in the national health labour force collection is very broad. State/territory health authorities have more detailed classifications for salaried medical practitioners in hospitals. These classifications separate interns, the resident medical officer levels, registrar levels, career medical officer positions, and supervisory positions including clinical and medical superintendents. Space restrictions do not at present permit these classes to be included in the National Health Labour Force Collection questionnaire.

Client type (alcohol and other drug treatment services)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—client type, code N
METeOR identifier:	270083
Registration status:	Health, Standard 01/03/2005
Definition:	The status of a person in terms of whether the treatment episode concerns their own alcohol and/or other drug use or that of another person, as represented by a code.
Data Element Concept:	Episode of treatment for alcohol and other drugs—client type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Own alcohol or other drug use
2	Other's alcohol or other drug use

Collection and usage attributes

Guide for use:

CODE 1 Own alcohol or other drug use

Use this code for a client who receives treatment or assistance concerning their own alcohol and/or other drug use.

Use this code where a client is receiving treatment or assistance for both their own alcohol and/or other drug use and the alcohol and/or other drug use of another person.

CODE 2 Other's alcohol or other drug use

Use this code for a client who receives support and/or assistance in relation to the alcohol and/or other drug use of another person.

Collection methods: To be collected on commencement of a treatment episode with a service.

Data element attributes

Collection and usage attributes

Guide for use: Where Code 2 Other's alcohol or other drug use is reported, do not collect the following data elements:

Episode of treatment for alcohol and other drugs—drug of concern (principal), code (ASCDC 2000 extended) NNNN;

Episode of treatment for alcohol and other drugs—drug of concern (other), code (ASCDC 2000 extended) NNNN;

Client—injecting drug use status, code N; and

Client—method of drug use (principal drug of concern), code N.

Comments: Required to differentiate between clients according to whether the treatment episode concerns their own alcohol and/or other drug use or that of another person to provide a basis for description of the people accessing alcohol and other drug treatment services.

Clinical evidence of acute coronary syndrome related medical history

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—clinical evidence status (acute coronary syndrome related medical history), yes/no code N
METeOR identifier:	356777
Registration status:	Health, Standard 01/10/2008
Definition:	An indicator of whether there is objective evidence for a person's history of an acute coronary syndrome related medical condition, as represented by a code.
Data Element Concept:	Person—clinical evidence status (acute coronary syndrome related medical history)

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

Use this code where there is objective evidence to support a history of an acute coronary syndrome related medical condition.

CODE 2 No

Use this code where the history is not supported by objective evidence.

Objective evidence for acute coronary syndrome related medical conditions are classified as:

Chronic lung disease:

Diagnosis supported by current use of chronic lung disease pharmacological therapy (e.g. inhalers, theophylline, aminophylline, or steroids), or a forced expiratory volume in 1 second (FEV1) less than 80% predicted FEV1/forced vital capacity (FVC) less than 0.7 (post bronchodilator). Respiratory failure partial pressure of oxygen (PaO2) less than 60 mmHg (8kPa), or partial pressure of carbon dioxide (PaCO2) greater than 50 mmHg (6.7 kPa).

Heart failure:

Current symptoms of heart failure (typically shortness of breath or fatigue), either at rest or during exercise and/or signs of pulmonary or peripheral congestion and objective evidence of cardiac dysfunction at rest. The diagnosis is derived from and substantiated by clinical documentation from testing according to current practices.

Stroke:

Diagnosis for ischaemic: non-haemorrhagic cerebral infarction or haemorrhagic: intracerebral haemorrhage supported by cerebral imaging (CT or MRI).

Peripheral arterial disease:

- Peripheral artery disease: diagnosis is derived from and substantiated by clinical documentation for a person with a history of either chronic or acute occlusion or narrowing of the arterial lumen in the aorta or extremities.
- Aortic aneurysm: diagnosis of aneurysmal dilatation of the aorta (thoracic and or abdominal) supported and substantiated by appropriate documentation of objective testing.

- Renal artery stenosis: diagnosis of functional stenosis of one or both renal arteries is present and is supported and substantiated by appropriate documentation of objective testing.

Sleep apnoea:

Diagnosis derived from and substantiated by clinical documentation of sleep apnoea syndrome (SAS). SAS has been diagnosed from the results of a sleep study.

Other vascular conditions:

- Atrial fibrillation: diagnosis supported by electrocardiogram findings.
- Other cardiac arrhythmias and conductive disorders: diagnosis supported by electrocardiogram findings.
- Left ventricular hypertrophy: diagnosis supported by echocardiograph evidence.

Collection methods:

For each of the following medical conditions the clinical evidence status must also be recorded:

- Chronic lung disease
- Heart failure
- Stroke
- Peripheral arterial disease
- Sleep apnoea syndrome
- Other vascular conditions

Comments:

Heart failure:

Chronic heart failure is a complex clinical syndrome with typical symptoms (e.g. shortness of breath, fatigue) that can occur at rest or on effort, and is characterised by objective evidence of an underlying structural abnormality of cardiac dysfunction that impairs the ability of the ventricle to fill with or eject blood (particularly during physical activity).

The most widely available investigation for documenting left ventricular dysfunction is the transthoracic echocardiogram (TTE).
Other modalities include:

- transoesophageal echocardiography (TOE)
- gated radionuclide angiocardiography
- angiographic left ventriculography

In the absence of any adjunctive laboratory tests, evidence of supportive clinical signs of ventricular dysfunction. These include:

- cardiac auscultation (S3, cardiac murmurs),
- cardiomegaly,

- elevated jugular venous pressure (JVP),
- chest X-ray evidence of pulmonary congestion

Data element attributes

Collection and usage attributes

Guide for use: Only one code may be selected for this data element.

Where the incident occurred in a hospital, the name of the hospital department in which the incident occurred may provide the most appropriate description of the clinical service context. In many cases, the clinical service context will reflect the specialty of the main clinician treating the patient, but this will not always be the case. For example, where a patient is treated in the Emergency department by a gynaecologist, Code 1 'Emergency department' should be recorded.

Where the 'Primary incident or allegation type' is 'Anaesthetic', the code chosen for this item should relate to the main procedure that was being carried out, in the context of which the anaesthetic was being administered. Note that complications arising from the anaesthetic administration should not be used as the basis for selecting a category, for example broken teeth as a complication should not be coded as 'Dentistry'.

Where none of the other codes apply, select Code 88 'Other' and enter a brief description of the relevant clinical service area as described in the data element *Health-care incident—clinical service context, text X[X(39)].* Code 88 supersedes Code 21 previously used in historical data.

CODE 2 Cardiology

'Cardiology' excludes cardio-thoracic surgery.

CODE 3 Dentistry

'Dentistry' excludes oral and maxillofacial surgery.

CODE 8 General surgery

'General surgery' is used for all operations performed by surgeons and procedural general practitioners. Circumcision should also be included in this category.

CODE 9 Gynaecology

'Gynaecology' should only be recorded when the patient is female.

CODE 11 Neurology

'Neurology' excludes neurosurgery.

CODE 12 Obstetrics

'Obstetrics' should only be recorded when the patient is a baby (less than 1 year old) or a female of childbearing age.

CODE 13 Oncology

'Oncology' includes radiotherapy or nuclear medicine and gynae–oncology.

CODE 15 Paediatrics

'Paediatrics' excludes neonatology.

CODE 16 Perinatology (including neonatology)

'Perinatology (including neonatology)' is only recorded where the health-care incident that is the basis for the medical indemnity claim occurred shortly before or shortly after the birth of the patient.

CODE 24 Community-based care

'Community-based care' includes community care, hospital in the home, district nursing, and care delivered in nursing homes.

CODE 29 Pathology

'Pathology' includes cytology and tissue retention disputes.

CODE 30 Public health

'Public health' includes vaccination and screening programs, for example, Breastscreen.

CODE 88 Other

'Other' should be selected when none of the more specific codes above apply.

CODE 97 Not applicable

'Not applicable' covers claims for health-care incidents which lack an identifiable clinical service context, for instance incidents in a hospital's public access areas or complaints against disclosure of a patient's medical records.

CODE 99 Not stated/inadequately described

'Not stated/inadequately described' should be used when the information is not currently available. Not stated/inadequately described should not be used when a medical indemnity claim is closed.

Comments: In developing this data element, the Medical Indemnity Data Working Group initially agreed on a short list of key clinical areas of particular interest for medical indemnity claims analysis. The list has been expanded to make use of text descriptions previously provided by data suppliers in the free text field.

Clinical urgency

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—clinical urgency, code N
METeOR identifier:	270008
Registration status:	Health, Standard 01/03/2005
Definition:	A clinical assessment of the urgency with which a patient requires elective hospital care, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—clinical urgency

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Admission within 30 days desirable for a condition that has the potential to deteriorate quickly to the point that it may become an emergency
2	Admission within 90 days desirable for a condition causing some pain, dysfunction or disability but which is not likely to deteriorate quickly or become an emergency
3	Admission at some time in the future acceptable for a condition causing minimal or no pain, dysfunction or disability, which is unlikely to deteriorate quickly and which does not have the potential to become an emergency

Data element attributes

Collection and usage attributes

Guide for use:

The classification employs a system of urgency categorisation based on factors such as the degree of pain, dysfunction and disability caused by the condition and its potential to deteriorate quickly into an emergency. All patients ready for care must be assigned to one of the urgency categories, regardless of how long it is estimated they will need to wait for surgery.

Comments:

A patient's classification may change if he or she undergoes **clinical review** during the waiting period. The need for clinical review varies with the patient's condition and is therefore at the discretion of the treating clinician. The waiting list information system should be able to record dates when the classification is changed (metadata item Elective care waiting list episode—category reassignment date, DDMMYYYY).

METeOR identifier:	286995
Registration status:	Health, Standard 08/12/2004
Definition:	Whether a mental health service is co-located with an acute care hospital, as represented by a code.
Data Element Concept:	Specialised mental health service—co-location with acute care hospital

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Co-located
2	Not co-located

Collection and usage attributes

Guide for use:

CODE 1 Co-located

Co-located health services are those that are established physically and organisationally as part of an acute care hospital service. There are two forms of co-location:

- a health service that is built and managed as a ward or unit within an acute care hospital; or
- the health service operates in a separate building but is located on, or immediately adjoining, the acute care hospital campus.

In the second option, units and wards within a psychiatric hospital may be classified as co-located when all the following criteria apply:

- a single organisational or management structure covers the acute care hospital and the psychiatric hospital;

- a single employer covers the staff of the acute care hospital and the psychiatric hospital;
- the location of the acute care hospital and psychiatric hospital can be regarded as part of a single overall hospital campus; and
- the patients of the psychiatric hospital are regarded as patients of the single integrated health service.

Complex road name

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Address—complex road name, text X[45]
Synonymous names:	Complex street name
METeOR identifier:	429376
Registration status:	Community Services, Standard 06/02/2012 Health, Standard 07/12/2011
Definition:	The name of the road/thoroughfare of an address within a complex, as represented by text.
Data Element Concept:	Address—complex road name

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	String
Format:	X[45]
Maximum character length:	45

Data element attributes

Collection and usage attributes

Guide for use:

Complex addresses provide for the unique identification of secondary address sites within a larger, primary address site. A complex address requires both parts (secondary and primary) to provide unique definition.

Within a road name it is possible to find what appears to be a Road type. It is also possible to have a null Road type.

Usage Examples:

Biology Building B
20-24 Genetics Lane North (Complex road name is Genetics)
Blamey Research Institute
1-131 Sunshine Rd
CAIRNS QLD 4870

Rose Cottage
9 Garden Walk (Complex road name is Garden)
Happy Valley Retirement Village
75 Davis Street
NORWOOD SA 5067

Guide for use:

Complex addresses provide for the unique identification of secondary address sites within a larger, primary address site. A complex address requires both parts (secondary and primary) to provide unique definition.

In the case of a ranged address within a complex, this data element is used in combination with the *Address—complex road number 2, road number X[6]* data element to obtain the first and last numbers of the address.

Usage Examples:

Biology Building B
20-24 Genetics Lane North (Complex road number 1 is 20)
Blamey Research Institute
1-131 Sunshine Rd

CAIRNS QLD 4870

Rose Cottage
9 Garden Walk (Complex road number 1 is 9)
Happy Valley Retirement Village
75 Davis Street
Guide for use/examples
NORWOOD SA 5067

This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006 Interchange of client information standard. Components of the primary address are:

Address site (or Primary Complex) name
Address number or number range
Road name (name/type/suffix)
Locality
State/Territory
Postcode (optional)
Country (if applicable).

Source and reference attributes

Complications of pregnancy

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Pregnancy (current)—complication, code (ICD-10-AM 7th edn) ANN{.N[N]}
METeOR identifier:	405823
Registration status:	Health, Standard 22/12/2009
Definition:	Complications arising up to the period immediately preceding delivery that are directly attributable to the pregnancy and may have significantly affected care during the current pregnancy and/or pregnancy outcome, as represented by a code
Data Element Concept:	Pregnancy (current)—complication

Value domain attributes

Representational attributes

Classification scheme:	International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition
Representation class:	Code
Data type:	String
Format:	ANN{.N[N]}
Maximum character length:	6

Collection and usage attributes

Guide for use:	Complications and conditions should be coded within the Pregnancy, Childbirth, Puerperium chapter 15 of Volume 1, ICD-10-AM.

Data element attributes

Collection and usage attributes

Guide for use:	Examples of these conditions include threatened abortion, antepartum haemorrhage, pregnancy-induced hypertension and gestational diabetes. There is no arbitrary limit on the number of complications specified.
Comments:	Complications often influence the course and outcome of

pregnancy, possibly resulting in hospital admissions and/or adverse effects on the fetus and perinatal morbidity.

Source and reference attributes

Submitting organisation:	National Perinatal Data Development Committee

Relational attributes

Related metadata references:	Supersedes Pregnancy (current)—complication, code (ICD-10-AM 6th edn) ANN{.N[N]} Health, Superseded 22/12/2009

Condition onset flag

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care—condition onset flag, code N
METeOR identifier:	354816
Registration status:	Health, Standard 05/02/2008
Definition:	A qualifier for each coded diagnosis to indicate the onset of the condition relative to the beginning of the episode of care, as represented by a code.
Data Element Concept:	Episode of admitted patient care—condition onset flag

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Condition with onset during the episode of admitted patient care
	2	Condition not noted as arising during the episode of admitted patient care
Supplementary values:	9	Not reported

Collection and usage attributes

Guide for use:

1 Condition with onset during the episode of admitted patient care

- a condition which arises during the episode of admitted patient care and would not have been present on admission

Includes:

Conditions resulting from misadventure during medical or surgical care during the episode of admitted patient care.

Abnormal reactions to, or later complication of, surgical or medical care arising during the episode of admitted patient care.

Conditions arising during the episode of admitted patient care not related to surgical or medical care (for example, pneumonia).

2 Condition not noted as arising during the episode of admitted patient care

- a condition present on admission such as the presenting problem, a comorbidity, chronic disease or disease status.
- a previously existing condition not diagnosed until the episode of admitted patient care.

Includes:

In the case of neonates, the conditions present at birth.

A previously existing condition that is exacerbated during the episode of admitted patient care.

Conditions that are suspected at the time of admission and subsequently confirmed during the episode of admitted patient care.

Conditions that were not diagnosed at the time of admission but clearly did not develop after admission (for example malignant neoplasm).

Conditions where the onset relative to the beginning of the episode of admitted patient care is unclear or unknown.

9 Not reported

The condition onset flag could no be reported due to limitations of the data management system.

Data element attributes

Collection and usage attributes

Guide for use:

Assign the relevant condition onset flag to ICD-10-AM diagnosis codes assigned in the principal diagnosis and additional diagnosis fields for the National Hospital Morbidity Database collection.

The sequencing of diagnosis codes must comply with the Australian Coding Standards and therefore diagnosis codes should not be re-sequenced in an attempt to list diagnosis codes with the same condition onset flag together.

When it is difficult to decide if a condition was present at the beginning of the episode of care or if it arose during the episode, assign a value of 2 - Condition not noted as arising during this episode of care.

The principal diagnosis should always have a condition onset flag value of 2.

Explanatory notes:

The flag on external cause, place of occurrence and activity codes should match that of the corresponding injury or disease code.

The flag on morphology codes should match that on the corresponding neoplasm code

When a single diagnosis code describes a condition and that code contains more than one concept (e.g. diabetes with renal complications) and each concept within that code has a different condition onset flag, then assign a value of 2.

When a condition requires more than one diagnosis code to describe it, it is possible for each diagnosis code to have a different condition onset flag.

The flag on Z codes related to the outcome of delivery on the mother's record (Z37), should always be assigned a value of 2.

The flag on Z codes related to the outcome of delivery on the baby's record (Z38), should always be assigned a value of 2.

Collection methods: A condition onset flag should be recorded and coded upon completion of an episode of admitted patient care.

Comments: The condition onset flag is a means of differentiating those conditions which arise during, or arose before, an admitted patient episode of care. Having this information will provide an insight into the kinds of conditions patients already have when entering hospital and what arises during the episode of care. A better understanding of those conditions arising during the episode of care may inform prevention strategies particularly in relation to complications of medical care.

The flag only indicates when the condition had onset, and cannot be used to indicate whether a condition was considered to be preventable.

Contract procedure flag

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of care (procedure)—contracted procedure flag, code N
METeOR identifier:	270473
Registration status:	Health, Standard 01/03/2005
Definition:	Designation that a procedure was not performed in this hospital but was performed by another hospital as a contracted service, as represented by a code.
Data Element Concept:	Episode of care (procedure)—contracted procedure flag

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	[N]
Maximum character length:	1

Permissible values:

Value	Meaning
1	Contracted admitted procedure
2	Contracted non-admitted procedure

Data element attributes

Collection and usage attributes

Guide for use:

Procedures performed at another hospital under contract (Hospital B) are recorded by both hospitals, but flagged by the contracting hospital only (Hospital A). This flag is to be used by the contracting hospital to indicate a procedure performed by a contracted hospital. It also indicates whether the procedure was performed as an admitted or non-admitted service.

Allocation of procedure codes should not be affected by the contract status of an episode: the Australian Coding Standards should be applied when coding all episodes. In particular, procedures which would not otherwise be coded should not be coded solely because they were performed at another hospital under contract.

Procedures performed by a health care service (i.e. not a recognised hospital) should be coded if appropriate. Some jurisdictions may require these to be separately identified and they could be distinguished from contracted hospital procedures through the use of an additional code in the contract procedure flag data item.

Technical name:	Hospital—contract type, code N
METeOR identifier:	270475
Registration status:	Health, Standard 01/03/2005
Definition:	The type of contract arrangement between contractor and the contracted hospital, as represented by a code.
Data Element Concept:	Hospital—contract type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Contract type B
2	Contract type ABA
3	Contract type AB
4	Contract type (A)B
5	Contract type BA

Collection and usage attributes

Guide for use:

The contracting hospital (purchaser) is termed Hospital A. The contracted hospital (provider) is termed Hospital B.

CODE 1 Contract Type B

A health authority / other external purchaser contracts hospital B for admitted service which is funded outside the standard funding arrangements.

CODE 2 Contract Type ABA

Patient admitted by Hospital A. Hospital A contracts Hospital B for admitted or non-admitted patient service. Patient returns to Hospital A on completion of service by Hospital B.

For example, a patient has a hip replacement at Hospital A, then receives aftercare at Hospital B, under contract to Hospital A. Complications arise and the patient returns to Hospital A for the remainder of care.

CODE 3 Contract Type AB

Patient admitted by Hospital A. Hospital A contracts Hospital B for admitted or non-admitted patient service. Patient does not return to Hospital A on completion of service by Hospital B.
For example, a patient has a hip replacement at Hospital A and then receives aftercare at Hospital B, under contract to Hospital A. Patient is separated from Hospital B.

CODE 4 Contract Type (A)B

This contract type occurs where a Hospital A contracts Hospital B for the whole episode of care. The patient does not attend Hospital A. For example, a patient is admitted for endoscopy at Hospital B under contract to Hospital A.

CODE 5 Contract Type BA

Hospital A contracts Hospital B for an admitted patient service following which the patient moves to Hospital A for remainder of care. For example, a patient is admitted to Hospital B for a gastric resection procedure under contract to Hospital A and Hospital A provides after care.

Coronary artery disease—history of intervention or procedure

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—coronary artery disease intervention (history), code N
METeOR identifier:	270227
Registration status:	Health, Standard 01/03/2005
Definition:	Whether the individual has undergone a coronary artery by-pass grafting (CABG), angioplasty or stent, as represented by a code.
Data Element Concept:	Person—coronary artery disease intervention

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	CABG, angioplasty or stent - undertaken in last 12 months
2	CABG, angioplasty or stent - undertaken prior to the last 12 months
3	CABG, angioplasty or stent - both within and prior to the last 12 months

	4	No CABG, angioplasty or stent undertaken
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Comments:

CABG is known as 'bypass surgery' when a piece of vein (taken from the leg) or of an artery (taken from the chest or wrist) is used to form a connection between the aorta and the coronary artery distal to the obstructive lesion, making a bypass around the blockage. Angioplasty is an **elective surgery** technique of blood vessels reconstruction.

Stenting is a non-surgical treatment used with balloon angioplasty or after, to treat coronary artery disease to widen a coronary artery. A stent is a small, expandable wire mesh tube that is inserted. The purpose of the stent is to help hold the newly treated artery open, reducing the risk of the artery re-closing (re-stenosis) over time.

Angioplasty with stenting typically leaves less than 10% of the original blockage in the artery (Heart Center Online).

These three procedures are commonly used to improve blood flow to the heart muscle when the heart's arteries are narrowed or blocked.

The sooner procedures are done, the greater the chances of saving heart muscle.

Data element attributes

Collection and usage attributes

Collection methods: Ask the individual if he/she has had a CABG, angioplasty or coronary stent. If so determine when it was undertaken within or prior to the last 12 months (or both).

METeOR identifier:	459971
Registration status:	Community Services, Standard 28/02/2012 Health, Standard 28/02/2012
Definition:	The country component of the address of a person, as represented by a code.
Data Element Concept:	Person (address)—country identifier

Value domain attributes

Representational attributes

Classification scheme:	Standard Australian Classification of Countries 2011
Representation class:	Code
Data type:	Number
Format:	NNNN
Maximum character length:	4

Collection and usage attributes

Guide for use:

The Standard Australian Classification of Countries 2011 (SACC) is a four-digit, three-level hierarchical structure specifying major group, minor group and country.

A country, even if it comprises other discrete political entities such as states, is treated as a single unit for all data domain purposes. Parts of a political entity are not included in different groups. Thus, Hawaii is included in Northern America (as part of the identified country United States of America), despite being geographically close to and having similar social and cultural characteristics as the units classified to Polynesia.

Data element attributes

Collection and usage attributes

Collection methods: Collect the data at the 4-digit level.

Comments: Note that the Standard Australian Classification of Countries (SACC) is mappable to but not identical to Australian Standard Classification of Countries for Social Statistics (ASCCSS).

Source and reference attributes

Reference documents: Standard Australian Classification of Countries Edition 1, Catalogue number 1269.0, 2011, Canberra: Australian Bureau of Statistics

Guide for use:

The Standard Australian Classification of Countries 2011 (SACC) is a four-digit, three-level hierarchical structure specifying major group, minor group and country.

A country, even if it comprises other discrete political entities such as states, is treated as a single unit for all data domain purposes. Parts of a political entity are not included in different groups. Thus, Hawaii is included in Northern America (as part of the identified country United States of America), despite being geographically close to and having similar social and cultural characteristics as the units classified to Polynesia.

Data element attributes

Collection and usage attributes

Collection methods:

Some data collections ask respondents to specify their country of birth. In others, a pre-determined set of countries is specified as part of the question, usually accompanied by an 'other (please specify)' category.

Recommended questions are:

In which country were you/was the person/was (name) born?

Australia

Other (please specify)

Alternatively, a list of countries may be used based on, for example common Census responses.

In which country were you/was the person/was (name) born?

Australia

England

New Zealand

Italy

Viet Nam

India

Scotland

Philippines

Greece

Germany

Other (please specify)

In either case coding of data should conform to the SACC.

Sometimes respondents are simply asked to specify whether they were born in either 'English speaking' or 'non-English speaking' countries but this question is of limited use and this method of collection is not recommended.

Comments:

This metadata item is consistent with that used in the ABS collection methods and is recommended for use whenever there is a requirement for comparison with ABS data (last viewed 2/6/2008).

Data element attributes

Collection and usage attributes

Guide for use:

CODE 8888 if test for CK was not done for this hospital presentation.

Where possible, several CK measures should be recorded and their associated date and time. At a minimum, an initial, peak and late value should be recorded.

When only one CK level is recorded, this should be the peak level.

Comments:

Elevation of CK isoenzyme is an indication of damage to muscle.

There are three different CK isoenzyme sub-forms:

- CK-MM (skeletal muscle)

- CK-MB (cardiac muscle)

- CK-BB (brain tissue)

Creatinine serum level (measured)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—creatinine serum level, total micromoles per litre NN[NN]

METeOR identifier: 360936

Registration status: Health, Standard 01/10/2008

Definition: A person's serum creatinine level measured in micromoles per litre.

Data Element Concept: Person—creatinine serum level

Value domain attributes

Representational attributes

Representation class: Total

Data type: String

Format: NN[NN]

Maximum character length: 4

Unit of measure: Micromole per litre (µmol/L)

Data element attributes

Collection and usage attributes

Guide for use: There is no agreed standard as to which units serum creatinine should be recorded in.

Note: If the measurement is obtained in mmol/L it is to be multiplied by 1000.

Collection methods: Measurement of creatinine should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authority.

- Single venous blood test taken at the time of other screening blood tests.
- Fasting not required.

Comments: Serum creatinine can be used to help determine renal function. Serum creatinine by itself is an insensitive measure of renal function because it does not increase until more than 50% of renal function has been lost.

Serum creatinine together with a patient's age, weight and sex can be used to calculate glomerular filtration rate (GFR), which is an indicator of renal status/ function. The calculation uses the Cockcroft-Gault formula.

Creatinine is normally produced in fairly constant amounts in the muscles, as a result the breakdown of phosphocreatine. It passes into the blood and is excreted in the urine. Serum creatinine can be used to help determine renal function. The elevation in the creatinine level in the blood indicates disturbance in kidney function.

GFR decreases with age, but serum creatinine remains relatively stable. When serum creatinine is measured, renal function in the elderly tends to be overestimated, and GFR should be used to assess renal function, according to the Cockcroft-Gault formula:

$$\text{GFR (ml/min)} = \frac{\text{(140 - age [yrs]) x body wt (kg)}}{\text{814 x serum creatinine (mmol/l)}} \quad \text{[x 0.85 (for women)]}$$

An alternative formula is derived from the Modification of Diet in Renal Disease (MDRD) study and does not rely on knowledge of body weight:

GFR (ml/min/1.73m2) = 32788 x creatinine$^{-1.154}$ (umol/L) x age$^{-0.203}$ x (males: 1, females: 0.742).

To determine the degree of chronic renal impairment

GFR > 90ml/min - normal

GFR >60 - 90ml/min - mild renal impairment

GFR >30 - 60ml/min - moderate renal impairment

GFR 0 - 30 ml/min - severe renal impairment

Note: The above GFR measurement should be for a period greater than 3 months. GFR may also be assessed by 24-hour creatinine clearance adjusted for body surface area.

In general, patients with GFR < 30 ml/min are at high risk of progressive deterioration in renal function and should be referred to a nephrology service for specialist management of renal failure.

Patients should be assessed for the complications of chronic renal impairment including anaemia, hyperparathyroidism and be referred for specialist management if required.

Patients with rapidly declining renal function or clinical features to suggest that residual renal function may decline rapidly (ie. hypertensive, proteinuric (>1g/24hours), significant comorbid illness) should be considered for referral to a nephrologist well before function declines to less than 30ml/min. (Draft CARI Guidelines 2002. Australian Kidney Foundation). Patients in whom the cause of renal impairment is uncertain should be referred to a nephrologist for assessment.

Technical name:	Date—accuracy indicator, code AAA
METeOR identifier:	294429
Registration status:	Community Services, Standard 30/09/2005 Housing assistance, Standard 23/08/2010 Health, Standard 04/05/2005 Early Childhood, Standard 21/05/2010 Homelessness, Standard 23/08/2010
Definition:	An indicator of the accuracy of the components of a reported date, as represented by a code.
Data Element Concept:	Date—accuracy indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	AAA
Maximum character length:	3

Permissible values:

Value	Meaning
AAA	Day, month and year are accurate
AAE	Day and month are accurate, year is estimated
AAU	Day and month are accurate, year is unknown
AEE	Day is accurate, month and year are estimated
AEU	Day is accurate, month is estimated, year is unknown
AUU	Day is accurate, month and year are unknown
AUA	Day is accurate, month is unknown, year is accurate

AUE	Day is accurate, month is unknown, year is estimated
AEA	Day is accurate, month is estimated, year is accurate
EAA	Day is estimated, month and year are accurate
EAE	Day is estimated, month is accurate, year is estimated
EAU	Day is estimated, month is accurate, year is unknown
EEA	Day and month are estimated, year is accurate
EEE	Day, month and year are estimated
EEU	Day and month are estimated, year is unknown
EUA	Day is estimated, month is unknown, year is accurate
EUE	Day is estimated, month is unknown, year is estimated
EUU	Day is estimated, month and year are unknown
UAA	Day is unknown, month and year are accurate
UAE	Day is unknown, month is accurate, year is estimated
UAU	Day is unknown, month is accurate, year is unknown
UEA	Day is unknown, month is estimated, year is accurate
UEE	Day is unknown, month and year are estimated
UEU	Day is unknown, month is estimated, year is unknown
UUA	Day and month are unknown, year is accurate
UUE	Day and month are unknown, year is estimated

UUU	Day, month and year are unknown

Collection and usage attributes

Guide for use:

Any combination of the values A, E, U representing the corresponding level of accuracy of each date component of the reported date.

This data element consists of a combination of three codes, each of which denotes the accuracy of one date component:

A – the referred date component is accurate

E – the referred date component is not known but is estimated

U – the referred date component is not known and not estimated.

This data element contains positional fields (DMY) that reflects the order of the date components in the format (DDMMYYYY) of the reported date:

Field 1 (D) – refers to the accuracy of the day component;

Field 2 (M) – refers to the accuracy of the month component;

Field 3 (Y) – refers to the accuracy of the year component.

Data domain	Date component (for a format DDMMYYYY)		
	(D)ay	(M)onth	(Y)ear
Accurate	A	A	A
Estimated	E	E	E
Unknown	U	U	U

This data element is valid only for use with dates that are reported/exchanged in the format (DDMMYYYY).

Example 1: A date has been sourced from a reliable source and is known as accurate then the Date accuracy indicator should be informed as (AAA).

Example 2: If only the age of the person is known and there is no certainty of the accuracy of this, then the Date accuracy indicator should be informed as (UUE). That is the day and month are “unknown” and the year is “estimated”.

Example 3: If a person was brought in unconscious to an emergency department of a hospital and the only information available was from a relative who was certain of the age and the birthday's 'month' then the Date accuracy indicator should be informed as (UAA). A year derived from an accurate month and accurate age is always an accurate year.

The Date accuracy indicator can be useful for operational purposes to indicate the level of accuracy that a date has been collected at any point in time. It can indicate whether the stored date needs to be followed up until it reaches the intended minimal required accuracy. For example, if a person was brought in unconscious to an emergency department of a hospital the level of accuracy of the date collected at that point may not be satisfactory. It is likely that the correct date of birth can be obtained at a later date. The Date accuracy indicator provides information on the accuracy of the entered dates that may require further action.

For future users of the data it may also be essential they know the accuracy of the date components of a reported date.

Data element attributes

Collection and usage attributes

Collection methods:

Collection constraints:

If constraints for the collection of the date are imposed, such as 'a valid date must be input in an information system for unknown date components', the Date accuracy indicator should be used along with the date as a way of avoiding the contamination of the valid dates with the same value on the respective date components.

Example:

Some jurisdictions use 0107YYYY and some use 0101YYYY when only the year is known. When month and year are known some use the 15th day as the date i.e. 15MMYYYY. Where this occurs in a data collection that is used for reporting or analysis purposes there will be dates in the collection with the attributes 0107YYYY etc that are accurate and some that are not accurate. Without a corresponding flag to determine this accuracy the analysis or report will be contaminated by those estimated dates.

Comments:

Provision of a date is often a mandatory requirement in data collections.

Most computer systems require a valid date to be recorded in a date field i.e. the month part must be an integer between 1 and 12, the day part must be an integer between 1 and 31 with rules about the months with less than 31 days, and the year part should include the century. Also in many systems, significant dates (e.g. date of birth) are mandatory requirements.

However, in actual practice, the date or date components are often not known (e.g. date of birth, date of injury) but, as stated above, computer systems require a valid date. This means that a date MUST be included and it MUST follow the rules for a valid date. It therefore follows that, while such a date will contain valid values according to the rules for a date, the date is in fact an ‘unknown’ or ‘estimated’ date. For future users of the data it is essential they know that a date is accurate, unknown or estimated and which components of the date are accurate, unknown or estimated.

Date health-care incident occurred

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Health-care incident—date health-care incident occurred, DDMMYYYY
METeOR identifier:	329661
Registration status:	Health, Standard 07/12/2011
Definition:	The date on which a health-care incident occurred, expressed as DDMMYYYY.
Data Element Concept:	Health-care incident—date health-care incident occurred

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

The date should reflect when the primary incident or allegation type occurred. Where the 'Primary incident or allegation type' reflects a series of events that occurred over a period of months (for example, repeated failure to diagnose a condition), the date when the first event occurred should be recorded. For example, where a missed diagnosis was the main, dominant or primary cause giving rise to a medical indemnity claim, the date recorded should reflect when the diagnosis should first have been made, but was not.

This data element should be used in conjunction with the data element: *Date—accuracy indicator, code AAA* to flag whether each component of the date reported is accurate, estimated or unknown.

Comments:

This data element is equivalent to the Australian Prudential Regulation Authority (2006) National Claims and Policies Database data item 9 'Date of loss' which collects information on the date on which the incident giving rise to the claim is believed to have occurred.

It is recognised that 'date of discoverability' is recorded in some jurisdictions, and may also be used in the specification of the statutes of limitations in some jurisdictions. The date of discoverability may be some time after the health-care incident occurred; for example, where a doctor fails to diagnose a problem, this may not be discovered for some months. After discussion the Medical Indemnity Data Working Group agreed that the date 'when something went wrong' is likely to be more relevant in the context of the Medical Indemnity National Collection (Public Sector) than 'when it was discovered that something had gone wrong'.

Data Element Concept:	Person—date of birth

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

If date of birth is not known or cannot be obtained, provision should be made to collect or estimate age. Collected or estimated age would usually be in years for adults, and to the nearest three months (or less) for children aged less than two years. Additionally, an estimated date flag or a date accuracy indicator should be reported in conjunction with all estimated dates of birth.

For data collections concerned with children's services, it is suggested that the estimated date of birth of children aged under 2 years should be reported to the nearest 3 month period, i.e. 0101, 0104, 0107, 0110 of the estimated year of birth. For example, a child who is thought to be aged 18 months in October of one year would have his/her estimated date of birth reported as 0104 of the previous year. Again, an estimated date flag or date accuracy indicator should be reported in conjunction with all estimated dates of birth.

Collection methods: Information on date of birth can be collected using the one question:

What is your/(the person's) date of birth?

In self-reported data collections, it is recommended that the following response format is used:

Date of birth: _ _ / _ _ / _ _ _ _

This enables easy conversion to the preferred representational layout (DDMMYYYY).

For record identification and/or the derivation of other metadata items that require accurate date of birth information, estimated dates of birth should be identified by a date accuracy indicator to prevent inappropriate use of date of birth data. The linking of client records from diverse sources, the sharing of patient data, and data analysis for research and planning all rely heavily on the accuracy and integrity of the collected data. In order to maintain data integrity and the greatest possible accuracy an indication of the accuracy of the date collected is critical. The collection of an indicator of the accuracy of the date may be essential in confirming or refuting the positive identification of a person. For this reason it is strongly recommended that the data element Date—accuracy indicator, code AAA also be recorded at the time of record creation to flag the accuracy of the data.

Comments: Privacy issues need to be taken into account in asking persons their date of birth.

Wherever possible and wherever appropriate, date of birth should be used rather than age because the actual date of birth allows a more precise calculation of age.

When date of birth is an estimated or default value, national health and community services collections typically use 0101 or 0107 or 3006 as the estimate or default for DDMM.

It is suggested that different rules for reporting data may apply when estimating the date of birth of children aged under 2 years because of the rapid growth and development of children within this age group which means that a child's development can vary considerably over the course of a year. Thus, more specific reporting of estimated age is suggested.

Date of cessation of treatment episode for alcohol and other drugs

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—treatment cessation date, DDMMYYYY
METeOR identifier:	270067
Registration status:	Health, Standard 01/03/2005
Definition:	The date on which a treatment episode for alcohol and other drugs ceases.
Data Element Concept:	Episode of treatment for alcohol and other drugs—treatment cessation date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Refers to the date of the last service contact in a treatment episode between the client and staff of the treatment provider. In situations where the client has had no contact with the treatment provider for three months, nor is there a plan in place for further contact, the date of last service contact should be used. Refer to the glossary item **Cessation of treatment episode for alcohol and other drugs** to determine when a treatment episode ceases.

The date must be later than or the same as the treatment commencement date for the episode of treatment for alcohol and other drugs.

Comments:

Required to identify the cessation of a treatment episode by an alcohol and other drug treatment service.

Technical name:	Person—date of death, DDMMYYYY
METeOR identifier:	287305
Registration status:	Community Services, Standard 30/09/2005 Health, Standard 04/05/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The date of death of the person.
Data Element Concept:	Person—date of death

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Recorded for persons who have died.

Where Date of birth is collected, Date of death must be equal to or greater than Date of birth for the same person.

Collection methods:

It is recommended that in cases where all components of the date of death are not known or where an estimate is arrived at from age, a valid date be used together with a flag to indicate that it is an estimate.

For record identification and/or the derivation of other metadata items that require accurate date of death information, estimated dates of death should be identified by a date accuracy indicator to prevent inappropriate use of date of death data. The linking of client records from diverse sources, the sharing of patient data, and data analysis for research and planning all rely heavily on the accuracy and integrity of the collected data. In order to maintain data integrity and the greatest possible accuracy an indication of the accuracy of the date collected is critical. The collection of Date accuracy indicator may be essential in confirming or refuting the positive identification of a person. For this reason it is strongly recommended that the data element Date accuracy indicator also be recorded at the time of record creation to flag the accuracy of the data.

Date of diagnosis of cancer

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Patient—diagnosis date of cancer, DDMMYYYY

METeOR identifier: 416129

Registration status: Health, Standard 07/12/2011

Definition: The date on which the patient was first diagnosed with cancer (whether at its primary site or as a metastasis), expressed as DDMMYYYY.

Data Element Concept: Patient—diagnosis date of cancer

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: Date of diagnosis must be:

- Greater than or equal to date of birth
- Less than or equal to date of death

Diagnosis of cancer after death:

If the patient is first diagnosed with the cancer in an autopsy report the date of diagnosis is the date of death as stated on the patient's death certificate.

Incidental diagnosis of cancer:

If a patient is admitted for another condition (for example a broken leg or pregnancy), and a cancer is diagnosed incidentally then the date of diagnosis is the date the cancer was diagnostically determined, not the admission date.

Collection methods: Reporting rules:

The date of diagnosis is the date of the pathology report, if any, that first confirmed the diagnosis of cancer. This date may be found attached to a letter of referral or a patient's medical record from another institution or hospital. If this date is unavailable, or if no pathological test was done, then the date may be determined from one of the sources listed in the following sequence:

- Date of the consultation at, or admission to, the hospital, clinic or institution when the cancer was first diagnosed. Note: DO NOT use the admission date of the current admission if the patient had a prior diagnosis of this cancer.
- Date of first diagnosis as stated by a recognised medical practitioner or dentist. Note: This date may be found attached to a letter of referral or a patient's medical record from an institution or hospital.
- Date the patient states they were first diagnosed with cancer. Note: This may be the only date available in a few cases (for example, patient was first diagnosed in a foreign country).

If components of the date are not known, an estimate should be provided with an estimated date flag to indicate that it is estimated. If an estimated date is not possible, a standard date of 15 June 1900 should be used with a flag to indicate the date is not known. Additionally, a date accuracy indicator should be recorded in conjunction with the estimated date.

Comments: Patient administration system, cancer notification system, population cancer statistics, research.

Date of diagnosis of first recurrence as distant metastasis

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—diagnosis date of first recurrence as distant metastasis, DDMMYYYY
METeOR identifier:	393841
Registration status:	Health, Standard 07/12/2011
Definition:	The date on which a patient is diagnosed with the first recurrence as a distant metastasis of the same histology as the primary cancer, expressed as DDMMYYYY.
Data Element Concept:	Patient—diagnosis date of first recurrence as distant metastasis

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Record the date the first recurrence as distant metastasis is diagnosed.

The term recurrence defines the return, reappearance or metastasis of cancer (of the same histology) after a disease-free intermission or remission.

Distant metastasis refers to the spread of cancer of the same histology as the original (primary) tumour to distant organs or distant lymph nodes.

The date is based on the most definitive diagnostic information available and ideally will correspond to the date of the investigation recorded in data element *Person with cancer—most valid basis of diagnosis of the first recurrence, code N.* For instance, record the date of the first histological or, if unavailable, cytological investigation confirming the diagnosis of recurrence. If these investigations have not been performed, record the date of confirmation by clinical investigation.

This information should be obtained from the patient's medical record. In the first instance, the diagnosis date should be derived from the relevant investigation report; for example, tissue diagnosis from the pathology report and imaging from the imaging reports.

If the diagnosis is made on the basis of clinical examination, record the date this is performed. For example, this may be the date of a consultation, an outpatient appointment or the date the patient is admitted to hospital.

If the patient was diagnosed by clinical examination and/or investigations performed elsewhere, the date may be found in a letter of referral from a recognised medical practitioner or dentist. Usually the relevant test result, if applicable, will be attached to this.

In some cases, the date the patient states they were diagnosed with recurrence will be the only date available and should be recorded here. For example, the patient may have been diagnosed whilst overseas.

If components of the date are not known, an estimate should be provided where possible with an estimated date flag to indicate that it is estimated. If an estimated date is not possible, a standard date of 15 June 1900 should be used with a flag to indicate the date is not known.

Collection methods: This information should be obtained from the patient's medical record.

Comments: This data item is used to measure the efficacy of the initial course of treatment through evaluating the time interval from diagnosis to recurrence, treatment to recurrence and recurrence to death.

Date of diagnosis of first recurrence as locoregional cancer

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Patient—diagnosis date of first recurrence as locoregional cancer, DDMMYYYY

METeOR identifier: 393837

Registration status: Health, Standard 07/12/2011

Definition: The date on which a patient is diagnosed with the first recurrence as locoregional cancer of the same histology as the primary cancer, expressed as DDMMYYYY.

Data Element Concept: Patient—diagnosis date of first recurrence as locoregional cancer

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: Record the date the first recurrence as locoregional cancer is diagnosed.

The term recurrence defines the return, reappearance or metastasis of cancer (of the same histology) after a disease free period.

Locoregional recurrence refers to the recurrence of cancer cells at the same site as the original (primary) tumour or the regional lymph nodes. A list of those lymph nodes defined as regional lymph nodes for each cancer site can be found in the TNM Classification of Malignant Tumours International Union Against Cancer (UICC) and the American Joint Committee on Cancer (AJCC) Cancer Staging Manual; the latest editions are recommended.

The date is based on the most definitive diagnostic information available and ideally should correspond to the date of the investigation recorded in data element *Person with cancer-most valid basis of diagnosis of the first recurrence, code N*. For instance, record the date of the first histological or if unavailable, cytological investigation confirming the diagnosis of recurrence. If these investigations have not been performed, record the date of confirmation by clinical investigation.

This information should be obtained from the patient's medical record. In the first instance, the diagnosis date should be derived from the relevant investigation report; for example, tissue diagnosis from the pathology report and imaging from the imaging reports.

If the diagnosis is made on the basis of clinical examination, record the date this is performed. For example, this may be the date of a consultation, an outpatient appointment or the date the patient is admitted to hospital.

If the patient was diagnosed by clinical examination and/or investigations performed elsewhere, the date may be found in a letter of referral from a recognised medical practitioner or dentist. Usually the relevant test result, if applicable, will be attached to this.

In some cases, the date the patient states they were diagnosed with recurrence will be the only date available and should be recorded here. For example, the patient may have been diagnosed whilst overseas.

If components of the date are not known, an estimate should be provided where possible with an estimated date flag to indicate that it is estimated. If an estimated date is not possible, a standard date of 15 June 1900 should be used with a flag to indicate the date is not known.

Date of first contact

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Community nursing service episode—first contact date, DDMMYYYY

METeOR identifier: 270190

Registration status: Health, Standard 01/03/2005

Definition: The date of first contact with the community nursing service for an episode of care, between a staff member and a person or a person's family.

Data Element Concept: Community nursing service episode—first contact date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: This should occur after a previous last contact date of a previous care episode and prior to or on the same as first service delivery date.

Includes:

- visits made to a person in institutional settings such as liaison visits or discharge planning visits, made in a hospital or residential aged care service with the intent of planning for the future delivery of service at home;
- telephone contacts when these are in lieu of a first home or hospital visit for the purpose of preliminary assessment for care at home;
- visits made to the person's home prior to admission for the purpose of assessing the suitability of the home environment for the person's care.

This applies irrespective of whether the person is present or not.

Excludes:

- first visits where the visit objective is not met, such as first visit made where no one is home.

Collection methods: The first contact date can be the same as first service delivery date and apply whether a person is entering care for the first time or any subsequent episode. This date should be recorded when it is the same as the first delivery of service date.

Comments: This metadata item is recommended for use in community services which are funded for liaison or discharge planning positions or provide specialist consultancy or assessment services. Further developments in community care, including casemix and coordinated care will require collection of data relating to resource expenditure across the sector.

To enable analysis of time periods throughout a care episode, especially the pre-admission period and associated activities. This metadata item enables the capture of the commencement of care irrespective of the setting in which the activities took place.

Source and reference attributes

Submitting organisation: Australian Council of Community Nursing Services

Date of first delivery of service

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care (community setting)—first service delivery date, DDMMYYYY

METeOR identifier: 270210

Registration status: Health, Standard 01/03/2005

Definition: The date of first delivery of service to a person in a non-institutional setting.

Data Element Concept: Episode of care—first service delivery date (community setting)

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: This date may occur on the same day or prior to the Date of last delivery of service, but must never occur after that date within the current episode of care. The date may be the same as the Community nursing service episode—first contact date, DDMMYYYY.

Collection methods: As long as contact is made with the person in a non-institutional setting, the Episode of care (community setting)—first service delivery date, DDMMYYYY must be recorded. Normally this will be the first home or clinic visit and is the date most often referred to in a service agency as the admission. This date applies whether a person is being admitted for the first time, or is being re-admitted for care.

Comments: This metadata item is used for the analysis of time periods within a care episode and to locate that episode in time. The date relates to the first delivery of formal services within the community setting.

This date marks the most standard event, which occurs at the beginning of an episode of care in community setting. It should not be confused with the Date of first contact with a community nursing service; although they could be the same, the dates for both items must be recorded. Agencies providing **hospital-in-the-home** services should develop their own method of distinguishing between the period the person remains a formal patient of the hospital, with funding to receive services at home, and the discharge of the person into the care of the community service.

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Record the date on which the patient was last known to be alive.

The date of last contact may be used for administrative purposes in conjunction with the patient's last known cancer status to identify how complete the treatment information is.

The last contact date may, for example, be the discharge date of an inpatient stay, the date of an outpatient appointment, the date of an investigation such as a scan or the date of a home visit by, for instance, a palliative care nurse or occupational therapist.

The last contact date may also be derived from an official source, for example, a letter from a physician detailing the patient's last follow-up appointment.

Many hospitals conduct routine follow-up of patients and the last contact date may result from a phone call to the patient.

The date of last contact should be updated as required.

If the patient has multiple primary cancers, all records should have the same date of last contact.

The date of death is collected as a separate item.

The date of last contact must be:

- Greater than the date of diagnosis, and
- Less than or equal to the date of death.

Collection methods: The information should be collected from the patient's medical record.

Comments: This information is used for patient follow-up and outcome studies.

Date of onset of acute coronary syndrome symptoms

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—acute coronary syndrome symptoms onset date, DDMMYYYY
Synonymous names:	Date of onset of ACS symptoms
METeOR identifier:	321201
Registration status:	Health, Standard 01/10/2008
Definition:	The date on which a person experienced acute coronary syndrome symptoms that prompted the person to seek medical attention, either at the hospital or from a general practitioner.
Data Element Concept:	Person—acute coronary syndrome symptoms onset date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Acute coronary syndrome symptoms may include:

- tightness, pressure, heaviness, fullness or squeezing in the chest which may spread to the neck and throat, jaw, shoulders, the back, upper abdomen, either or both arms and even into the wrist and hands
- dyspnoea, nausea/vomiting, cold sweat or syncope.

Seeking medical attention could include the person presenting to their GP who then refers them to hospital or the person presenting directly to hospital (via ambulance or own form of transport).

If the person is already a patient at the hospital for another reason then the date would be when they advised hospital staff of their symptoms.

Collection methods: Record the date that the person identifies as being when the most significant acute coronary syndrome symptom/s occurred that prompted them to seek medical attention.

To be provided when the ventricular ejection fraction is measured.

Date patient presents

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Health service event—presentation date, DDMMYYYY
METeOR identifier:	270393
Registration status:	Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The date on which the patient/client presents for the delivery of a service.
Data Element Concept:	Health service event—presentation date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

For community health care, outreach services and services provided via telephone or telehealth, this may be the date on which the service provider presents to the patient or the telephone/telehealth session commences.

The date of patient presentation at the **Emergency department** is the earliest occasion of being registered clerically or triaged.

The date that the patient presents is not necessarily:

- the listing date for care (see listing date for care), nor
- the date on which care is scheduled to be provided, nor
- the date on which commencement of care actually occurs (for admitted patients see admission date, for hospital non-admitted patient care and community health care see service commencement date).

Degree of spread of cancer

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—degree of spread of a cancer, code N
METeOR identifier:	270180
Registration status:	Health, Standard 01/03/2005
Definition:	Degree of spread of cancer is a measure of the progression/extent of cancer at a particular point in time, as represented by a code.
Data Element Concept:	Person with cancer—degree of spread of a cancer

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Localised to the tissue of origin
	2	Invasion of adjacent tissue or organs
	3	Regional lymph nodes
	4	Distant metastases
	5	Not Applicable
Supplementary values:	9	Unknown

Collection and usage attributes

Guide for use:

The valid values for the variable are listed below.

CODE 1 Localised to the tissue of origin

Includes a primary cancer where the spread is contained within the organ of origin. Note: this includes in situ breast (D05.0-D05.9) and in situ melanoma (D03.0-D03.9)

Example 1: For colon cancer, the cancer has not progressed into the adventitia (peritoneal layer) surrounding the colon.

Example 2: For breast cancer, the cancer has not progressed into the underlying muscle layer (pectoral) or externally to the skin.

Example 3: For melanoma of the skin, the cancer has not invaded the subcutaneous fat layer (that is, it is contained within the dermis and epidermis).

Example 4: For lung cancer, the cancer has not invaded the pleura.

CODE 2 Invasion of adjacent tissue or organs

A primary cancer has spread to adjacent organs or tissue not forming part of the organ of origin. This category includes sub-cutaneous fat or muscle and organs adjacent to the primary cancer site.

Example 1: For colon cancer, the cancer has progressed into the adventitia (peritoneal layer) surrounding the colon.

Example 2:For breast cancer, the degree of spread has progressed into the underlying muscle layer (pectoral) or externally into the skin.

Example 3: For melanoma of the skin, the cancer has invaded into subcutaneous fat or muscle.

Example 4: For lung cancer, the cancer has invaded the pleura or tissues of the mediastinum.

CODE 3 Regional lymph nodes

The primary cancer has metastasised to the nearby draining lymph nodes. The list below shows the regional lymph nodes by site of primary cancer (International Union Against Cancer's definition).

Head and neck - Cervical nodes

Larynx - Cervical nodes

Thyroid - Cervical and upper mediastinal nodes

Stomach - Perigastric nodes along the lesser and greater curvatures

Colon and Rectum - Pericolic, perirectal, and those located along the ileocolic, right colic, middle colic, left colic, inferior mesenteric and superior rectal

Anal - Perirectal, internal iliac, and inguinal lymph nodes

Liver - Hilar nodes, e.g. the hepatoduodenal ligament

Pancreas - Peripancreatic nodes

Lung - Intrathoracic, scalene and supraclavicular

Breast - Axillary, interpectoral, internal mammary

Cervix - Paracervical, parametrial, hypogastric, common, internal and external iliac, presacral and sacral

Ovary - Hypogastric (obturator), common iliac, external iliac, lateral, sacral, para-aortic and inguinal

Prostate and bladder - Pelvic nodes below the bifurcation of the common iliac arteries

Testes - Abdominal, para-aortic and paracaval nodes, the intrapelvic and inguinal nodes

Kidney - Hilar, abdominal, para-aortic or paracaval.

CODE 4 Distant metastases

The primary cancer has spread to sites distant to the primary site, for example liver and lung and bone, or any lymph nodes not stated as regional to the site (see '3 - Regional lymph nodes' above).

CODE 5 Not applicable

This category applies for lymphatic and haematopoietic cancers, e.g. myelomas, leukaemias and lymphomas (C81.0 - C96.9) only.

CODE 9 Unknown

No information is available on the degree of spread at this episode or the available information is insufficient to allow classification into one of the preceding categories.

Department of Veterans' Affairs file number

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—government funding identifier, Department of Veterans' Affairs file number AAXXNNNNA

METeOR identifier: 339127

Registration status: Community Services, Standard 31/08/2007
Health, Standard 29/11/2006

Definition: A unique personal identifier issued to a veteran by the Department of Veterans' Affairs.

Data Element Concept: Person—government funding identifier

Value domain attributes

Representational attributes

Representation class: Identifier

Data type: String

Format: AAXXNNNN[A]

Maximum character length: 9

Collection and usage attributes

Guide for use: 1st character is the state code (an alphabetic character) - N, V, Q, W, S or T for the appropriate state/territory. Australian Capital Territory is included in New South Wales (N) and Northern Territory with South Australia (S).

Next 7 characters are the file number, made up of:
War code + numeric digits, where:
if War code is 1 alphabetic character, add 6 numeric characters (ANNNNNN)

Where there is no war code as is the case with World War 1 veterans, insert a blank and add 6 numeric characters (NNNNNN)

if War code is 2 alphabetic characters, add 5 numeric characters (AANNNNN)
if War code is 3 alphabetic characters, add 4 numeric characters (AAANNNN)

The 9th character is the segment link. For dependents of veterans, the 9th character is always an alphabetic character. The alphabetic code is generated in the order by which the cards are issued. For example A, B, C, D etc.

CAUTIONARY NOTE: For veterans the 9th character is left blank

Data element attributes

Collection and usage attributes

Collection methods:

The Department of Veterans' Affairs file number should only be collected from persons eligible to receive health services that are to be funded by the DVA. The number may be reported to the appropriate government agency to reconcile payment for the service provided.

DVA card number:

This number is the digitised version of the file number. If paper claims are optically scanned by the Health Insurance Commission, the digitised version of the file number is picked up by the scanner and converted to the normal file number format. For manual claims, the gold and white cards may be used in conjunction with the data element and an imprinter. This method records the DVA file number and other card details on a manual voucher.

The data should not be used by private sector organisations for any purpose unless specifically authorised by law. For example, private sector organisations should not use the DVA file number for data linking unless specifically authorised by relevant privacy legislation.

This number must be recorded by a service provider each time a service is provided to a person who holds the entitlement for reimbursement purposes.

Comments:

All veterans and veteran community clients are issued with a DVA file number. The veteran community may access many different benefits, ranging from pensions to health services, through their DVA file number.

Note that Veterans may have a Medicare card number and a Department of Veterans Affairs (DVA) number or only a DVA number.

DVA has three (3) types of health cards:

- Gold Card
- White Card
- Repatriation Pharmaceutical Benefits Card.

Each card indicates, to the health provider, the level of health services the holder is eligible for, at the DVA expense.

The Gold card enables the holder to access a comprehensive range of health care and related services, for all conditions, whether they are related to war service or not.

The White card enables the holder to access health care and associated services for war or service-related conditions. Veterans of Australian forces may also be issued this card to receive treatment for malignant cancer, pulmonary tuberculosis and post traumatic stress disorder and, for Vietnam veterans only, anxiety or depression, irrespective of whether these conditions are related to war service or not.

The white card holders are eligible to receive, for specific conditions, treatment from registered medical, hospital, pharmaceutical, dental and allied health care providers with whom DVA has arrangements.

A white card is also issued to eligible ex-service personnel who are from other countries, which enter into arrangements with the Australian government for the treatment of the conditions that these countries accept as war related.

When a gold/white card holder accesses health services at DVA expense, the DVA File Number is critical and should be used. The person's Medicare card number is not required or relevant.

It should be noted that there are a number of gold card holders who do not have a Medicare card.

The Repatriation Pharmaceutical Benefits card is an orange coloured card issued to eligible veterans and merchant mariners from Britain and the Commonwealth and other allied countries. This card enables the holder to access the range of pharmaceutical items available under the Repatriation Pharmaceutical Benefits Scheme. It does not provide access to other health services.

Technical name:	Episode of care—funding eligibility indicator (Department of Veterans Affairs), code N
METeOR identifier:	270092
Registration status:	Health, Standard 01/03/2005
Definition:	Whether an eligible person's charges for this hospital **admission** are met by the Department of Veterans' Affairs (DVA), as represented by a code.
Context:	Health services
Data Element Concept:	Episode of care—funding eligibility indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:	Refer to the Veterans' Entitlements Act 1986 for details of eligible DVA beneficiaries.
Collection methods:	Whether or not charges for this episode of care are met by the DVA is routinely established as part of hospital admission processes.
Comments:	Eligible veterans and war widow/widowers can receive free treatment at any public hospital, former Repatriation Hospitals (RHs) or a Veteran Partnering (VP) contracted private hospital as a private patient in a shared ward, with

the doctor of their choice. Admission to a public hospital does not require prior approval from the DVA.

When treatment cannot be provided within a reasonable time in the public health system at a former RH or a private VP hospital, there is a system of contracted non-VP private hospitals which will provide care.

Admission to a contracted private hospital requires prior financial authorisation from DVA. Approval may be given to attend a non-contracted private hospital when the service is not available at a public or contracted non-VP private hospital.

In an emergency a Repatriation patient can be admitted to the nearest hospital, public or private, without reference to DVA.

If an eligible veteran or war widow/widower chooses to be treated under Veterans' Affairs arrangements, which includes obtaining prior approval for non-VP private hospital care, DVA will meet the full cost of their treatment.

To assist in analyses of utilisation and health care funding.

Dependency in activities of daily living—bathing

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—dependency in activities of daily living (bathing), code N

METeOR identifier: 270413

Registration status: Health, Standard 01/03/2005

Definition: An indicator of a person's need for assistance with bathing, as represented by a code.

Context: Dependency reflects the person's need, rather than the actual service provision which addresses that need. This is essential information in the community environment, where the relationship between a person's functional status and care allocated is not direct. The involvement of 'informal' carers, the possibility of resource allocation being driven by availability rather than need, and the vulnerability of system to inequity, all require a 'standard' view of the person. It is against this background that resource allocation and carer burden can then be monitored. It is important to distinguish between this view of dependency and that of the institutional system, where a dependency 'measure' may be used to predict or dictate staffing needs or to allocate funding.

Data Element Concept: Person—dependency in activities of daily living

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

1	Independent
2	Requires observation or rare physical assistance
3	Cannot perform the activity without some

	assistance
4	Full assistance required (totally dependent)

Data element attributes

Collection and usage attributes

Guide for use:

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Each agency should seek to adopt a dependency classification, which can be mapped to other classifications and produce equivalent scores.

Collection methods:

Commencement of care episode (there may be several visits in which assessment data are gathered).

Comments:

There are a significant number of dependency instruments in use in the community and institutional care. The Community Nursing Minimum Data Set Australia recommends the adoption of a dependency tool from a limited range of options as outlined in Guide for use.

The Person dependency in activities of daily living metadata items consist of a number of standard elements, which can be used to map to and/or score from the majority of dependency instruments.

Dependency in activities of daily living—day-time technical nursing care requirement

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—technical nursing care requirement (day-time), total minutes NNN

METeOR identifier: 270420

Registration status: Health, Standard 01/03/2005

Definition: An indicator of a person's need for day-time technical nursing care per week measured in minutes.

Context: Dependency reflects the person's need, rather than the actual service provision which addresses that need. This is essential information in the community environment, where the relationship between a person's functional status and care allocated is not direct. The involvement of 'informal' carers, the possibility of resource allocation being driven by availability rather than need, and the vulnerability of system to inequity, all require a 'standard' view of the person. Data type: Number

Format: NNN

Maximum character length: 3

Supplementary values:

Value	Meaning
1	No technical care requirements

Unit of measure: Minute (m)

Data element attributes

Collection and usage attributes

Guide for use:

Record the minutes of day-time technical care required per week.

Technical care refers to technical tasks and procedures for which nurses receive specific education and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. In the community nursing setting, carers may undertake some of these activities within, and under surveillance, of a nursing care-plan. Some examples of technical care activities are:

- medication administration (including injections)
- dressings and other procedures
- venipuncture
- monitoring of dialysis
- implementation of pain management technology.

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Each agency should seek to adopt a dependency classification, which can be mapped to other classifications and produce equivalent scores.

Dependency in activities of daily living—night-time technical nursing care requirement

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—technical nursing care requirement (night-time), total minutes NNN
METeOR identifier:	270422
Registration status:	Health, Standard 01/03/2005
Definition:	A person's need for night-time technical nursing care per week measured in minutes.
Context:	Dependency reflects the person's need, rather than the actual service provision which addresses that need. This is essential information in the community environment, where the relationship between a person's functional status and care allocated is not direct. The involvement of 'informal' carers, the possibility of resource allocation being driven by availability rather than need, and the vulnerability of system to inequity, all require a 'standard' view of the person. It is against this background that resource allocation and carer burden can then be monitored. It is important to distinguish between this view of dependency and that of the institutional system, where a dependency 'measure' may be used to predict or dictate staffing needs or to allocate funding.
Data Element Concept:	Person—technical nursing care requirement

Value domain attributes

Representational attributes

Representation class:	Total	
Data type:	Number	
Format:	NNN	
Maximum character length:	3	
Supplementary values:	Value	Meaning
	1	No technical care requirements
Unit of measure:	Minute (m)	

Data element attributes

Collection and usage attributes

Guide for use:

Record the minutes of night-time technical care required per week.

Technical care refers to technical tasks and procedures for which nurses receive specific education and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. In the community nursing setting, carers may undertake some of these activities within, and under surveillance, of a nursing care-plan. Some examples of technical care activities are:

- medication administration (including injections)
- dressings and other procedures
- venipuncture
- monitoring of dialysis
- implementation of pain management technology.

Services may elect to adopt the measures as defined in this metadata item or adopt one of the following tools now available, such as the Bryan, Barthel, Katz, Functional Independence Measure, Resource Utilisation Groups etc.

Each agency should seek to adopt a dependency classification, which can be mapped to other classifications and produce equivalent scores.

Collection methods:

Commencement of care episode (there may be several visits in which assessment data are gathered).

Comments:

There are a significant number of dependency instruments in use in the community and institutional care. The Community Nursing Minimum Data Set Australia recommends the adoption of a dependency tool from a limited range of options as outlined in Guide for use.

The Person dependency in activities of daily living metadata items consist of a number of standard elements, which can be used to map to and/or score from the majority of dependency instruments.

Diabetes status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—diabetes mellitus status, code NN
METeOR identifier:	270194
Registration status:	Health, Standard 01/03/2005
Definition:	Whether a person has or is at risk of diabetes, as represented by a code.
Data Element Concept:	Person—diabetes mellitus status

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	String	
Format:	NN	
Maximum character length:	2	
Permissible values:	Value	Meaning
	01	Type 1 diabetes
	02	Type 2 diabetes
	03	Gestational diabetes mellitus (GDM)
	04	Other (secondary diabetes)
	05	Previous gestational diabetes mellitus (GDM)
	06	Impaired fasting glucose (IFG)
	07	Impaired glucose tolerance (IGT)
	08	Not diagnosed with diabetes
	09	Not assessed
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use: Note that where there is a Gestational diabetes mellitus (GDM) or Previous GDM (i.e. permissible values 3 & 5) and a current history of Type 2 diabetes then record 'Code 2' Type 2 diabetes.

This same principle applies where a history of either Impaired fasting glycaemia (IFG) or Impaired glucose tolerance (IGT) and a current history and Type 2 diabetes, then record 'Code 2' Type 2 diabetes.

CODE 01 Type 1 diabetes

Beta-cell destruction, usually leading to absolute insulin deficiency. Includes those cases attributed to an autoimmune process, as well as those with beta-cell destruction and who are prone to ketoacidosis for which neither an aetiology nor pathogenesis is known (idiopathic). It does not include those forms of beta-cell destruction or failure to which specific causes can be assigned (e.g. cystic fibrosis, mitochondrial defects). Some subjects with Type 1 diabetes can be identified at earlier clinical stages than 'diabetes mellitus'.

CODE 02 Type 2 diabetes

Type 2 includes the common major form of diabetes, which results from defect(s) in insulin secretion, almost always with a major contribution from insulin resistance.

CODE 03 Gestational diabetes mellitus (GDM)

GDM is a carbohydrate intolerance resulting in hyperglycaemia of variable severity with onset or first recognition during pregnancy. The definition applies irrespective of whether or not insulin is used for treatment or the condition persists after pregnancy. Diagnosis is to be based on the Australian Diabetes in Pregnancy Society (ADIPS) Guidelines.

CODE 04 Other (secondary diabetes)

This categorisation include less common causes of diabetes mellitus, but are those in which the underlying defect or disease process can be identified in a relatively specific manner. They include, for example, genetic defects of beta-cell function, genetic defects in insulin action, diseases of the exocrine pancreas, endocrinopathies, drug or chemical-induced, infections, uncommon forms of immune-mediated diabetes, other genetic syndromes sometimes associated with diabetes.

CODE 05 Previous GDM

Where the person has a history of GDM.

CODE 06 Impaired fasting glycaemia (IFG)

IFG or 'non-diabetic fasting hyperglycaemia' refers to fasting glucose concentrations, which are lower than those required to diagnose diabetes mellitus but higher than the normal reference range. An individual is considered to have IFG if they have a fasting plasma glucose of 6.1 or greater and less than 7.0 mmol/L if challenged with an oral glucose load, they have a fasting plasma glucose concentration of 6.1 mmol/L or greater, but less than 7.0 mmol/L, AND the 2 hour value in the Oral Glucose Tolerance Test (OGTT) is less than 7.8 mmol/L.

CODE 07 Impaired glucose tolerance (IGT)

IGT is categorised as a stage in the natural history of disordered carbohydrate metabolism; subjects with IGT have an increased risk of progressing to diabetes. IGT refers to a metabolic state intermediate between normal glucose homeostasis and diabetes. Those individuals with IGT manifest glucose intolerance only when challenged with an oral glucose load. IGT is diagnosed if the 2 hour value in the OGTT is greater than 7.8 mmol/L. and less than 11.1 mmol/L AND the fasting plasma glucose concentration is less than 7.0 mmol/L.

CODE 08 Not diagnosed with diabetes

The subject has no known diagnosis of Type 1, Type 2, GDM, Previous GDM, IFG, IGT or Other (secondary diabetes).

CODE 09 Not assessed

The subject has not had their diabetes status assessed.

CODE 99 Not stated/inadequately described

This code is for unknown or information unavailable.

Collection methods: The diagnosis is derived from and must be substantiated by clinical documentation.

Source and reference attributes

Origin: Developed based on Definition, Diagnosis and Classification of Diabetes Mellitus and its Complications Part 1: Diagnosis and Classifications of Diabetes Mellitus Provisional Report of a World Health Organization Consultation (Alberti & Zimmet 1998).

Diabetes therapy type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—diabetes therapy type, code NN
METeOR identifier:	270236
Registration status:	Health, Standard 01/03/2005
Definition:	The type of diabetes therapy the person is currently receiving, as represented by a code.
Data Element Concept:	Person—diabetes therapy type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
01	Diet and exercise only
02	Oral hypoglycaemic - sulphonylurea only
03	Oral hypoglycaemic - biguanide (eg metformin) only
04	Oral hypoglycaemic - alpha-glucosidase inhibitor only
05	Oral hypoglycaemic - thiazolidinedione only
06	Oral hypoglycaemic - meglitinide only
07	Oral hypoglycaemic - combination (eg biguanide & sulphonylurea)
08	Oral hypoglycaemic - other
09	Insulin only
10	Insulin plus oral hypoglycaemic
98	Nil - not currently receiving diabetes

		treatment
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 01 Diet & exercise only

This code includes the options of generalised prescribed diet; avoid added sugar/simple carbohydrates (CHOs); low joule diet; portion exchange diet and uses glycaemic index and a recommendation for increased exercise.

CODE 98 Nil - not currently receiving diabetes treatment

This code is used when there is no current diet, tablets or insulin therapy(ies).

CODE 99 Not stated/inadequately described

Use this code when missing information.

Data element attributes

Collection and usage attributes

Collection methods: To be collected at the commencement of treatment and at each review.

Comments: In settings where the monitoring of a person's health is ongoing and where management can change over time (such as general practice), the Service contact—service contact date, DDMMYYYY should be recorded.

The main use of this data element is to enable categorisation of management regimes against best practice for diabetes.

	0	No difficulty
	1	Mild difficulty
	2	Moderate difficulty
	3	Severe difficulty
	4	Complete difficulty
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept **'Disability'** and gives an indication of the experience of disability for a person.

In the context of health, an activity is the execution of a task or action by an individual. Activity limitations are difficulties an individual may have in executing an activity.

Difficulties with activities can arise when there is a qualitative or quantitative alteration in the way in which these activities are carried out. Difficulty includes matters such as 'with pain', 'time taken', 'number of errors', clumsiness', 'modification of manner in which an activity is performed' e.g. sitting to get dressed instead of standing. 'Difficulty' is a combination of the frequency with which the problem exists, the duration of the problem and the intensity of the problem. Activity limitations are assessed against a generally accepted population standard, relative to cultural and social expectations.

Activity limitation varies with the environment and is assessed in relation to a particular environment; the absence or presence of **assistance**, including aids and equipment, is an aspect of the environment.

The user will select the code that most closely summarises, in terms of duration, frequency, manner or outcome, the level of difficulty of the person for whom the data is recorded.

CODE 0 No difficulty in this life area

Is used when there is no difficulty in performing this activity. This scale has a margin of error of 5%. [0-4%]

CODE 1 Mild difficulty

Is recorded for example, when the level of difficulty is below the threshold for medical intervention, the difficulty is experienced less than 25% of the time, and/or with a low alteration in functioning which may happen occasionally over the last 30 days. [5-24%]

CODE 2 Moderate difficulty

Is used for example when the level of difficulty is experienced less than 50% of the time and/or with a significant, but moderate effect on functioning (Up to half the scale of total performance) which may happen regularly over the last 30 days. [25-49%]

CODE 3 Severe difficulty

Is used for example when performance in this life area can be achieved, but with only extreme difficulty, and/or with an extreme effect on functioning which may happen often over the last 30 days. [50-95%]

CODE 4 Complete difficulty

Is used when the person can not perform in this life area due of the difficulty in doing so. This scale has a margin of error of 5%. [96-100%]

CODE 8 Not specified

Is used where a person has difficulty with activities in a life area but there is insufficient information to use codes 0-4.

CODE 9 Not applicable

Is used where a life area is not applicable to this person, e.g. domestic life for a child under 5.

Comments:

Perceived psychological distress is a non-specific dimension of psychopathology and it indicates that something is wrong. It does not necessarily involve a mental illness or require services from the mental health system. However, cultural variations in experiencing and expressing the inner feelings and emotions have to be taken into account when interpreting the results

(ECHIM 2008).

Guide for use:

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

Code 1 Yes

Record if Q waves are identified on the follow-up electrocardiogram.

Code 2 No

Record if no Q waves are identified on the follow-up electrocardiogram.

Collection methods:

Do not record the presence of Q waves for the initial ECG. This data element should only be collected for follow-up ECGs.

Relational attributes

Related metadata references:

See also Electrocardiogram—new Q waves indicator, yes/no code N Health, Standard 01/10/2008

Implementation in Data Set Specifications:

Electrocardiogram cluster Health, Standard 01/10/2008

Conditional obligation:
Record for all follow up electrocardiograms performed after the initial electrocardiogram.

Education attendance status 30 days prior to imprisonment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Prison entrant—education attendance status 30 days prior to imprisonment, education attendance status code N
METeOR identifier:	412959
Registration status:	Health, Standard 25/08/2011
Definition:	The self-reported education attendance status of a prison entrant 30 days prior to imprisonment, as represented by a code.
Data Element Concept:	Prison entrant—education attendance status 30 days prior to imprisonment

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Full-time study
	2	Part-time study
	3	Not studying
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Only one option may be selected.

CODE 1 Full-time study

According to the *Social Security Act 2001*, a person is considered a full-time student in respect of a course if:

(a) in the case of a person who is enrolled in the course for a particular study period (for example, a semester), the person is undertaking at least three-quarters of the normal amount of full-time study in respect of the course for that period; or

(b) in the case of a person who intends to enrol in the course for a particular study period, the person intends to undertake at least three-quarters of the normal amount of full-time study in respect of the course for that period.

CODE 2 Part-time study

This code is used when the study load is less than 75% of a full-time load.

CODE 9 Not stated/ inadequately described

Is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: Australian Government. Social Security Act 1991. Viewed 18 October 2010

Data element attributes

Collection and usage attributes

Guide for use: This data element should be used in conjunction with the data element *Prison entrant—labour force status 30 days prior to imprisonment, code N* to capture information on the extent of a person's engagement in employment and education.

Respondents should identify the level of study/training they were involved in prior to entering prison. Respondents can identify courses classified as full or part-time by the definition used by the education institution providing the course, regardless of hours involved or use the Centrelink and Department of Education, Employment and Workplace Relations definition outlined in the *Social Security Act*.

Comments: Capturing the extent of engagement in employment and education of people entering prison is an important factor when following a throughcare approach to reducing recidivism and increasing protective factors for people involved in the criminal justice system. Information on the activities undertaken by a person immediately prior to entering prison will assist in identifying a person's pathway to prison and thereafter.

Electrocardiogram—new Q waves indicator

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Electrocardiogram—new Q waves indicator, yes/no code N

Synonymous names: ECG - new Q waves

METeOR identifier: 343902

Registration status: Health, Standard 01/10/2008

Definition: Whether the Q waves identified on a person's follow-up electrocardiogram (ECG) is new, as represented by a code.

Data Element Concept: Electrocardiogram—new Q waves indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes (New Q waves)

Use this code where the follow-up ECG identifies Q waves >=0.03 seconds in width and >=1mm (0.1mV) in depth in at least 2 contiguous leads that were not seen on the initial

ECG

CODE 2 No (Pre-existing Q waves)

Use this code where the follow-up ECG identifies Q waves >=0.03 seconds in width and >=1mm (0.1mV) in depth in at least 2 contiguous leads that were already seen on the initial ECG

CODE 9 Not stated/inadequately described

Includes unknown

Collection methods: Do not record whether the Q waves are new or not on the initial ECG. This data element should only be recorded for follow-up ECGs.

Comments: This data element identifies if new Q waves are present on the follow-up ECG. This information is valuable in coding transmural myocardial infarction.

Relational attributes

Related metadata references: See also Person—electrocardiogram Q waves indicator, yes/no code N Health, Standard 01/10/2008

Implementation in Data Set Specifications: Electrocardiogram cluster Health, Standard 01/10/2008

Conditional obligation:
Record if Q waves are present on the follow up electrocardiogram.

Electrocardiogram—lead V4R presence indicator

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Electrocardiogram—lead V4R presence indicator, yes/no code N
Synonymous names:	ECG - lead V4R indicator
METeOR identifier:	349656
Registration status:	Health, Standard 01/10/2008
Definition:	An indicator of whether lead V4R was performed on a person's electrocardiogram (ECG), as represented by a code.
Data Element Concept:	Electrocardiogram—lead V4R presence indicator

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Comments:

Lead V4R represents a lead placed on the chest aligned with the right mid-clavicular line, in the 5th intercostal space. The measurements from this lead can identify right ventricular infarction.

Lead V4R should be performed in the context of inferior infarction, especially in the presence of haemodynamic compromise.

Relational attributes

Related metadata references:	See also Electrocardiogram— ST-segment-elevation in lead V4R indicator, yes/no code N Health, Standard 01/10/2008

Electrocardiogram—ST-segment-elevation in lead V4R

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Electrocardiogram— ST-segment-elevation in lead V4R indicator, yes/no code N
Synonymous names:	ECG - ST-segment-elevation lead V4R
METeOR identifier:	343889
Registration status:	Health, Standard 01/10/2008
Definition:	An indicator of whether ST-segment-elevation of greater than or equal to 1mm (0.1mV) in lead V4R of the electrocardiogram (ECG) is present, as represented by a code.
Data Element Concept:	Electrocardiogram—electrocardiogram ST-segment-elevation in lead V4R indicator

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

ST-segment-elevation >= 1 mm (0.1 mV) in lead V4R

CODE 2 No

ST-segment-elevation in lead V4R of <= 1 mm (0.1 mV) or no ST-segment-elevation in lead V4R

CODE 9 Not stated/inadequately described

Includes unknown

Collection methods:

The presence (or absence) of ST-segment elevation in lead V4R should be recorded when right-sided precordial leads are performed in the ECG.

Comments:

ST-segment elevation in lead V4R represents right ventricular infarction.

Relational attributes

Related metadata references:

Conditional obligation:
Record when lead V4R was performed on the electrocardiogram.

Electrocardiogram change location

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Electrocardiogram—change location, code N
METeOR identifier:	356835
Registration status:	Health, Standard 01/10/2008
Definition:	The area in which the change is located on the electrocardiogram (ECG), as represented by a code.
Data Element Concept:	Electrocardiogram—change location

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Inferior leads: II, III, aVF
	2	Anterior leads: V1 to V4
	3	Lateral leads: I, aVL, V5 to V6
	4	True posterior: V1 V2
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 4 True posterior: V1 V2

True posterior is relevant only for tall R waves.

Data element attributes

Collection and usage attributes

Guide for use:

More than one code may be recorded.

Report in order of significance.

Where a change is located in all leads of the ECG codes 1, 2 and 3 should be recorded.

Record all codes that apply (code 9 is excluded from multiple coding).

Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

ST-segment changes

CODE 10 ST-segment-elevation >= 1 mm (0.1 mV) in >= 2 contiguous limb leads

ST-segment-elevation indicates greater than or equal to 1 mm (0.1 mV) elevation in 2 or more contiguous limb leads.

CODE 11 ST-segment-elevation >= 2 mm (0.2 mV) in >= 2 contiguous chest leads

ST-segment-elevation indicates greater than or equal to 2 mm (0.2 mV) elevation in 2 or more contiguous chest leads.

CODE 12 ST-segment depression >= 0.5 mm (0.05 mV) in >= 2 contiguous leads (includes reciprocal changes)

ST-segment depression of at least 0.5 mm (0.05 mV) in 2 or more contiguous leads (includes reciprocal changes).

T-wave changes

CODE 20 T-wave inversion >= 2 mm (0.2 mV)

T-wave inversion of at least 2 mm (0.2 mV) including inverted T waves that are not indicative of acute MI.

Q wave changes

CODE 30 Significant Q waves

Q waves refer to the presence of Q waves that are greater than or equal to 0.03 seconds in width and greater than or equal to 1 mm (0.1 mV) in depth in at least 2 contiguous leads.

Bundle-branch block changes

CODE 40 Left bundle branch block (BBB)

Diffuse left bundle-branch block pattern.

CODE 41 Right bundle-branch block (BBB)

Diffuse right bundle-branch block pattern.

CODE 42 Indeterminate bundle-branch block (BBB)

Bundle-branch block pattern identified, but left or right location is unclear.

CODE 90 Non-specific

Changes not meeting the above criteria.

CODE 99 Not stated/inadequately described

Includes unknown.

Data element attributes

Collection and usage attributes

Guide for use: More than one code may be recorded.

Record all that apply (codes 90 and 99 are excluded from multiple coding).

Collection methods: Where codes 40, 41 or 42 are recorded Electrocardiogram - bundle-branch block status, code N must also be recorded.

Data element attributes

Collection and usage attributes

Guide for use: Multiple electronic communication addresses (for example, multiple phone numbers, fax numbers and e-mail) may be recorded as required. Each instance should have an appropriate Electronic communication medium and usage code assigned.

Universal Resource Locator (URL)

One form of electronic address used as a locator for an internet-based web site.

Example: http://www.aihw.gov.au This is the full address, however, it is not essential to record 'http://www' as the commonly used internet browsers assume these characters are included. Therefore, the URL address could be recorded as 'aihw.gov.au'.

Email addresses

Email addresses are a combination of a username and an internet domain name (URL) joined by an @ symbol. The use of the full URL is not valid in an email address.

Example: myuserid@bigpond.net.au

Telephone numbers

- Record the prefix plus telephone number. For example, 08 8226 6000 or 0417 123456.
- Do not record punctuation in telephone numbers. For example, (08) 8226 6000 or 08-8226 6000 would not be correct.

Data element attributes

Collection and usage attributes

Guide for use:

Emergency department non-admitted clinical care can be commenced by a doctor, nurse, mental health practitioner or other health professional, when investigation, care and/or treatment is provided in accordance with an established clinical pathway defined by the emergency department. Placement of a patient in a cubicle and observations taken to monitor a patient pending a clinical decision regarding commencement of a clinical pathway, do not constitute commencement.

Patients with an episode end status of 'Did not wait to be attended by a healthcare professional' should not have a clinical care commencement date, because they left before investigation, care and/or treatment was commenced by a health professional in accordance with an established clinical pathway defined by the emergency department.

The following examples illustrate the commencement of emergency department non-admitted clinical care.

Example 1

- A patient presents at the emergency department with mild asthma. At triage, the patient is categorised as category three and returns to the waiting area.

- The patient has a more severe asthma attack in the waiting area, is re-triaged to category two and shown to a cubicle where standard observations are taken.

- A nurse comes to the cubicle and commences treatment based on an acknowledged clinical pathway of the emergency department. At this point: **emergency department clinical care has commenced.**

Example 2

- A patient presents at the emergency department in an agitated, delusional state. At triage, the patient is categorised as category two and placed in a cubicle and the mental health practitioner notified.

- Observations are taken and nursing staff continue to observe the patient.

- The mental health practitioner arrives, assesses the patient and develops a management plan. At this point: **emergency department clinical care has commenced.**

Example 3

- A patient presents at the emergency department with an ankle injury from football. At triage, the patient is categorised as category four and moved to the 'fast track area'.

- The physiotherapist attends, examines the patient, makes an assessment (including diagnostic imaging requirements) and determines a treatment plan. At this point: **emergency department clinical care has commenced.**

Example 4

- A patient presents at the emergency department with a sore arm, following a fall, with limited arm movement possible.

- The patient is categorised as category three at triage and placed in a cubicle.

- A nurse provides analgesia and assesses the patient, including ordering diagnostic imaging. At this point: **emergency department clinical care has commenced.**

Example 5

- A patient presents at the emergency department feeling vague and having been generally unwell for a day or two. The patient has a slight cough. At triage, the patient is categorised as category three.

- The patient is placed in a cubicle where standard observations are taken. Respiration is 26 bpm, BP is 90/60 and the patient is hypoxic. The patient is given oxygen, and the treating clinician attends and provides instruction regarding patient care. At this point: **emergency department clinical care has commenced.**

Example 6

- A patient presents at the emergency department with chest pain. Triage category two is allocated. The patient is placed in a cubicle and a nurse gives oxygen and Anginine, takes blood samples and conducts an ECG. The ECG is reviewed. At this point: **emergency department clinical care has commenced.**

- A doctor subsequently arrives and the patient is transferred to the catheter lab after examination.

Example 7

- The emergency department is notified by ambulance that a patient is being transported having severe behavioural problems.

- The patient is taken to an appropriate cubicle and restrained.

- A clinician administers sedation and requests the attendance of a mental health practitioner. At this point: **emergency department clinical care has commenced.**

Collection methods: Collected in conjunction with emergency department clinical care commencement time.

Supersedes Non-admitted patient emergency department service episode—clinical care commencement date, DDMMYYYY Health, Superseded 30/01/2012

Implementation in Data Set Specifications:

Non-admitted patient emergency department care NMDS 2012-2013 Health, Standard 30/01/2012

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Conditional obligation:

This data item is to be recorded if the patient has one of the following Episode end status values recorded:

- Admitted to this hospital (either short stay unit, hospital in the home or non-emergency department hospital ward);
- Non-admitted patient emergency department service episode completed—departed without being admitted or referred to another hospital;
- Non-admitted patient emergency department service episode completed—referred to another hospital for admission;
- Left at own risk after being attended by a health care professional but before the non-admitted patient emergency department service episode was completed;
- Died in emergency department as a non-admitted patient;
- Dead on arrival, emergency department clinician certified the death of the patient.

Emergency department clinical care commencement time

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Non-admitted patient emergency department service episode—clinical care commencement time, hhmm

METeOR identifier: 474118

Registration status: Health, Standard 30/01/2012

Definition: The time at which emergency department non-admitted clinical care commences, expressed as hhmm.

Context: Emergency department care.

Collection and usage attributes

Guide for use: Emergency department non-admitted clinical care can be commenced by a doctor, nurse, mental health practitioner or other health professional, when investigation, care and/or treatment is provided in accordance with an established clinical pathway defined by the emergency department. Placement of a patient in a cubicle and observations taken to monitor a patient pending a clinical decision regarding commencement of a clinical pathway, do not constitute commencement.

Patients with an episode end status of 'Did not wait to be attended by a healthcare professional' should not have a clinical care commencement time, because they left before investigation, care and/or treatment was commenced by a health professional in accordance with an established clinical pathway defined by the emergency department.

The following examples illustrate the commencement of emergency department non-admitted clinical care.

Example 1

- A patient presents at the emergency department with mild asthma. At triage, the patient is categorised as category three and returns to the waiting area.
- The patient has a more severe asthma attack in the waiting area, is re-triaged to category two and shown to a cubicle where standard observations are taken.
- A nurse comes to the cubicle and commences treatment based on an acknowledged clinical pathway of the emergency department. At this point: **emergency department clinical care has commenced**.

Example 2

- A patient presents at the emergency department in an agitated, delusional state. At triage, the patient is categorised as category two and placed in a cubicle and the mental health practitioner notified.
- Observations are taken and nursing staff continue to observe the patient.
- The mental health practitioner arrives, assesses the patient and develops a management plan. At this point: **emergency department clinical care has commenced**.

Example 3

- A patient presents at the emergency department with an ankle injury from football. At triage, the patient is categorised as category four and moved to the 'fast track area'.
- The physiotherapist attends, examines the patient, makes an assessment (including diagnostic imaging requirements) and determines a treatment plan. At this point: **emergency department clinical care has commenced**.

Example 4

- A patient presents at the emergency department with a sore arm, following a fall, with limited arm movement possible.

- The patient is categorised as category three at triage and placed in a cubicle.
- A nurse provides analgesia and assesses the patient, including ordering diagnostic imaging. At this point: **emergency department clinical care has commenced**.

Example 5

- A patient presents at the emergency department feeling vague and having been generally unwell for a day or two. The patient has a slight cough. At triage, the patient is categorised as category three.
- The patient is placed in a cubicle where standard observations are taken. Respiration is 26 bpm, BP is 90/60 and the patient is hypoxic. The patient is given oxygen, and the treating clinician attends and provides instruction regarding patient care. At this point: **emergency department clinical care has commenced**.

Example 6

- A patient presents at the emergency department with chest pain. Triage category two is allocated. The patient is placed in a cubicle and a nurse gives oxygen and Anginine, takes blood samples and conducts an ECG. The ECG is reviewed. At this point: **emergency department clinical care has commenced**.
- A doctor subsequently arrives and the patient is transferred to the catheter lab after examination.

Example 7

- The emergency department is notified by ambulance that a patient is being transported having severe behavioural problems.
- The patient is taken to an appropriate cubicle and restrained.
- A clinician administers sedation and requests the attendance of a mental health practitioner. At this point: **emergency department clinical care has commenced**.

Collection methods: Collected in conjunction with emergency department clinical care commencement date.

Guide for use: The episode end status should guide the selection of the value to be recorded in this field:

- If the patient is subsequently admitted to this hospital (either short stay unit, hospital-in-the-home or non-emergency department hospital ward), then record the date the patient leaves the emergency department to go to the admitted patient facility.

  Patients admitted to any other ward or bed within the emergency department have not physically departed the emergency department until they leave the emergency department.

  If the patient is admitted and subsequently dies before leaving the emergency department, then record the date the body was removed from the emergency department.

- If the service episode is completed without the patient being admitted, then record the date the patient's emergency department non-admitted clinical care ended.
- If the service episode is completed and the patient is referred to another hospital for admission, then record the date the patient leaves the emergency department.
- If the patient did not wait, then record the date the patient leaves the emergency department or was first noticed as having left.
- If the patient leaves at their own risk, then record the date the patient leaves the emergency department or was first noticed as having left.
- If the patient died in the emergency department, then record the date the body was removed from the emergency department.
- If the patient was dead on arrival, then record the date the body was removed from the emergency department. If an emergency department physician certified the death of the patient outside the emergency department, then record the date the patient was certified dead.

Collection methods: Collected in conjunction with emergency department physical departure time.

Comments: This data element has been developed for the purpose of State and Territory compliance with the Australian Health Care Agreement and the agreed national access performance indicator.

Registration status:	Health, Standard 30/01/2012
Definition:	The status of the patient at the end of the non-admitted patient emergency department service episode, as represented by a code.
Context:	Emergency department care.
Data Element Concept:	Non-admitted patient emergency department service episode—episode end status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Admitted to this hospital (either short stay unit, hospital-in-the-home or non-emergency department hospital ward)
2	Non-admitted patient emergency department service episode completed - departed without being admitted or referred to another hospital
3	Non-admitted patient emergency department service episode completed - referred to another hospital for admission

4	Did not wait to be attended by a health care professional
5	Left at own risk after being attended by a health care professional but before the non-admitted patient emergency department service episode was completed
6	Died in emergency department as a non-admitted patient
7	Dead on arrival, emergency department clinician certified the death of the patient

Collection and usage attributes

Guide for use:

CODE 1 Admitted to this hospital (either short stay unit, hospital-in-the-home or non-emergency department hospital ward)

This code includes patients who are admitted to this hospital and subsequently die before leaving the emergency department.

CODE 2 Non-admitted patient emergency department service episode completed - departed without being admitted or referred to another hospital

This code includes patients who departed under their own care, under police custody, under the care of a residential aged care facility or other carer.

This code excludes those who died in the emergency department as a non-admitted patient. Such instances should be coded to Code 6.

Guide for use:

An Emergency Department service event can be commenced by a doctor, nurse, mental health practitioner or other health professional, when investigation, care and/or treatment is provided in accordance with an established clinical pathway defined by the Emergency Department. Placement of a patient in a cubicle and observations taken to monitor a patient pending a clinical decision regarding commencement of a clinical pathway, do not constitute commencement.

The following examples illustrate the commencement of an Emergency Department service event.

Example 1

- A patient presents at the Emergency Department with mild asthma. At triage, the patient is categorised as category three and returns to the waiting area.

- The patient has a more severe asthma attack in the waiting area, is re-triaged to category two and shown to a cubicle where standard observations are taken.
- A nurse comes to the cubicle and commences treatment based on an acknowledged clinical pathway of the Emergency Department. At this point : **Emergency Department service event has commenced.**

Example 2

- A patient presents at the Emergency Department in an agitated, delusional state. At triage, the patient is categorised as category two and placed in a cubicle and the mental health practitioner notified.
- Observations are taken and nursing staff continue to observe the patient.
- The mental health practitioner arrives, assesses the patient and develops a management plan. At this point : **Emergency Department service event has commenced.**

Example 3

- A patient presents at the Emergency Department with an ankle injury from football. At triage, the patient is categorised as category four and moved to the 'fast track area'.

- The physiotherapist attends, examines the patient, makes an assessment (including diagnostic imaging requirements) and determines a treatment plan. At this point : **Emergency Department service event has commenced.**

Example 4

- A patient presents at the Emergency Department with a sore arm, following a fall, with limited arm movement possible.
- The patient is categorised as category three at triage and placed in a cubicle.
- A nurse provides analgesia and assesses the patient, including ordering diagnostic imaging. At this point : **Emergency Department service event has commenced.**

Example 5

- A patient presents at the Emergency Department feeling vague and having been generally unwell for a day or two. The patient has a slight cough. At triage, the patient is categorised as category three.
- The patient is placed in a cubicle where standard observations are taken. Respiration is 26 bpm, BP is 90/60 and the patient is hypoxic. The patient is given oxygen, and the treating clinician attends and provides instruction regarding patient care. At this point : **Emergency Department service event has commenced.**

Example 6

- A patient presents at the Emergency Department with chest pain. Triage category two is allocated. The patient is placed in a cubicle and a nurse gives oxygen and Anginine, takes blood samples and conducts an ECG. The ECG is reviewed. At this point : **Emergency Department service event has commenced.**
- A doctor subsequently arrives and the patient is transferred to the catheter lab after examination.

Example 7

- The Emergency Department is notified by ambulance that a patient is being transported having severe behavioural problems.
- The patient is taken to an appropriate cubicle and restrained.
- A clinician administers sedation and requests the attendance of a mental health practitioner. At this point : **Emergency Department service event has commenced.**

Emergency department waiting time to admission

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Non-admitted patient emergency department service episode—waiting time (to hospital admission), total hours and minutes NNNN

METeOR identifier: 270004

Registration status: Health, Standard 01/03/2005

Definition: The time elapsed for each patient from presentation to the emergency department to **admission** to hospital.

Data Element Concept: Non-admitted patient emergency department service episode—waiting time (to hospital admission)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NNNN

Maximum character length: 4

Unit of measure: Hour and minute

Collection and usage attributes

Guide for use: HHMM

Data element attributes

Collection and usage attributes

Guide for use: Calculated from admission date and time minus date and time patient presents for those emergency department patients who are admitted.

Collection methods: To be collected on patients presenting to emergency department for unplanned care in public hospitals with emergency department and private hospitals providing contracted services for the public sector.

Comments: This is a critical waiting times metadata item. It is used to examine the length of waiting time, for performance indicators and benchmarking. Information based on this metadata item will have many uses including to assist in the planning and management of hospitals and in health care research.

Emergency department waiting time to clinical care commencement

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Emergency department stay—waiting time (to commencement of clinical care), total minutes NNNNN
METeOR identifier:	471932
Registration status:	Health, Standard 22/12/2011
Definition:	The time elapsed in minutes for each patient from presentation in the emergency department to the commencement of the emergency department non-admitted clinical care.
Data Element Concept:	Emergency department stay—waiting time (to commencement of clinical care)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	NNNNN
Maximum character length:	5
Unit of measure:	Minute (m)

Data element attributes

Collection and usage attributes

Guide for use:

Calculated by subtracting the date and time the patient presents to the emergency department from the date and time the emergency department non-admitted clinical care commenced. Although triage category 1 is measured in seconds, it is recognised that the data will not be collected with this precision.

This data element should not be completed for patients who have an Episode end status of 'Did not wait'.

Comments:

It is recognised that at times of extreme urgency or multiple synchronous presentations, or if no medical officer is on duty in the emergency department, this service may be provided by a nurse.

Implementation end date: 30/06/2013

Conditional obligation:

This data item is to be recorded if the patient has one of the following Episode end status values recorded:

- Admitted to this hospital (either short stay unit, hospital in the home or non-emergency department hospital ward);
- Non-admitted patient emergency department service episode completed—departed without being admitted or referred to another hospital;
- Non-admitted patient emergency department service episode completed—referred to another hospital for admission;
- Left at own risk after being attended by a health care professional but before the non-admitted patient emergency department service episode was completed;
- Died in emergency department as a non-admitted patient;
- Dead on arrival, emergency department clinician certified the death of the patient.

Employee expenses

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Organisation—employee related expenses, total Australian currency NNNNN.N

METeOR identifier: 359947

Registration status: Health, Standard 05/12/2007

Definition: Expenses of an organisation consisting mainly of wages, salaries and supplements, superannuation employer contributions, and workers compensation premiums and payouts, in Australian currency.

Data Element Concept: Organisation—employee related expenses

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: NNNNN.N

Maximum character length: 6

Unit of measure: Australian currency (AU$)

Source and reference attributes

Submitting organisation: Health Expenditure Advisory Committee

Data element attributes

Collection and usage attributes

Guide for use: Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.

Employee related expenses are to be reported in millions to the nearest 100,000 e.g. $4,064,000 should be reported as $4.1 million.

When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).

Includes:

- Salaries, wages and supplements for all employees of the organisation (including contract staff employed by an agency, provided staffing data is also available). This is to include all paid leave (recreation, sick and long-service) and salary and wage payments relating to workers compensation leave.
- Superannuation employer contributions paid or, for an emerging cost scheme, that should be paid (as determined by an actuary) on behalf of establishment employees either by the establishment or a central administration such as a state health authority, to a superannuation fund providing retirement and related benefits to establishment employees, for a financial year.
- Workers compensation premiums and payments

Collection methods:

Employee related expenses are to be reported for the *Health industry relevant organisation type* and *Type of health and health related functions* data elements.

Health industry relevant organisation type

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments:

In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Employment status (admitted patient)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—labour force status, acute hospital and private psychiatric hospital admission code N
METeOR identifier:	269948
Registration status:	Health, Standard 01/03/2005
Definition:	Self-reported employment status of a person, immediately prior to **admission** to an acute or private psychiatric hospital, as represented by a code.
Context:	The Australian Health Ministers' Advisory Council Health Targets and Implementation Committee (1988) identified socioeconomic status as the most important factor explaining health differentials in the Australian population. The committee recommended that national health statistics routinely identify the various groups of concern. This requires routine recording in all collections of indicators of socioeconomic status. In order of priority, these would be: employment status, income, occupation and education.
Data Element Concept:	Person—labour force status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Unemployed / pensioner
2	Other

Data element attributes

Collection and usage attributes

Collection methods: In practice, this metadata item and current or last occupation could probably be collected with a single question, as is done in Western Australia:

Occupation?

For example:

- housewife or home duties
- pensioner miner
- tree feller
- retired electrician
- unemployed trades assistant
- child
- student
- accountant

However, for national reporting purposes it is preferable to distinguish these two data items logically.

Employment status—health professional

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Registered health professional—labour force status, registered health professional code N
METeOR identifier:	383389
Registration status:	Health, Standard 10/12/2009
Definition:	An indicator of whether a registered health professional is in paid employment, and if so whether the employment is within their registered profession.
Data Element Concept:	Registered health professional—labour force status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Employed in the registered profession
	2	Employed outside the registered profession
	3	Not employed
Supplementary values:	9	Unknown/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 EMPLOYED IN THE REGISTERED PROFESSION

Health professionals employed in the registered profession may be working in Australia or they may be working overseas.

CODE 2 EMPLOYED OUTSIDE OF THE REGISTERED PROFESSION

Health professionals who are employed in Australia or overseas, but not in the registered profession.

CODE 3 NOT EMPLOYED

Health professionals in this category may be unemployed (not employed and seeking work) or not in the labour force (not employed and not seeking work). This is consistent with the ABS Labour Force standard which allows the aggregation of 'Unemployed' and 'Not in the labour force' to form the category 'Not employed'.

FURTHER DEFINITIONS

The term 'employed' includes employees, employers, own account workers and contributing family workers.

The definitions of employed and unemployed in this data element differ slightly from Australian Bureau of Statistics (ABS) definitions. The main differences are:

- The labour force collection includes health professionals working in the Defence Forces. ABS does not, with the exception of the population census.
- ABS uses a tightly defined reference period for employment and unemployment; the labour force collection reference period is self-defined by the respondent as his/her usual status during the week before registration.
- The scope of the labour force collection is all health professionals listed by the Australian Health Practitioner Regulation Agency, regardless of their residential status in Australia. The scope of the ABS Labour Force Survey is usual residents of Australia. That is, those persons who will be living in Australia for at least 12 months.

Environmental factor

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—environmental factor, code (ICF 2001) AN[NNN]
METeOR identifier:	320207
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The physical, social and attitudinal environment in which people live and conduct their lives, as represented by a code.
Context:	The environment in which a person functions or experiences disability.
Data Element Concept:	Person—environmental factor

Value domain attributes

Representational attributes

Classification scheme:	International Classification of Functioning, Disability and Health 2001
Representation class:	Code
Data type:	String
Format:	AN[NNN]
Maximum character length:	5

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept 'Disability' and gives an indication of the experience of disability for a person.

Environmental factors represent the circumstances in which the individual lives. These factors are conceived as immediate (e.g. physical features of the environment, social environment) and societal (formal and informal social structures, services and systems). Different environments may have a very different impact on the same individual with a given health condition.

Facilitators are features of the environment that have a positive effect on **disability**. Barriers are features of the environment that have a negative effect on disability.

Data can be collected at the three digit level in one chapter and at the chapter level in another. However it is only possible to collect data at a single level of the hierarchy in a single chapter to maintain mutual exclusivity. For example, it is not permitted to collect both ‘Attitudes’ (chapter level) and ‘Social, norms, practices and ideology’ (3 digit level) as the former includes the latter.

The value domain below refers to the highest hierarchical level (ICF chapter level). Data collected at this level, in association with *Extent of environmental factor influence code [X]N* will use the codes as indicated. The full range of the permissible values together with definitions can be found in the *Environmental Factors* component of the ICF.

CODE e1   Products and technology
CODE e2   Natural environment and human-made changes to environment
CODE e3   Support and relationships
CODE e4   Attitudes
CODE e5   Services, systems and policies

Data collected at this level will provide a general description of the environmental factors and can only be compared with data collected at the same level.

An example of a value domain at the 3 digit level from the Environmental factors component may include:

CODE e225   Climate
CODE e240   Light
CODE e250   Sound
CODE e255   Vibration
CODE e260   Air quality

An example of a value domain at the 4 digit level from the environmental factors component may include:

CODE e1151   Assistive products and technology for personal use in daily life
CODE e1201   Assistive products and technology for personal indoor and outdoor mobility and transportation
CODE e2151   Assistive products and technology for communication
CODE e1301   Assistive products and technology for education
CODE e1351   Assistive products and technology for employment
CODE e1401   Assistive products and technology for culture, recreation and sport
CODE e1451   Assistive products and technology for the

practice of religion and spirituality

The prefix ***e*** denotes the domains within the component of *Environmental Factors*.

Data element attributes

Collection and usage attributes

Guide for use: This data element is a neutral list of environmental factors. It may be used, in conjunction with Person—extent of environmental factor influence, code (ICF 2001) [X]N, in health, community services and other disability-related data collections to record the environmental factors that facilitate or inhibit optimum functioning at the body, person or societal level. Identification of environmental factors may assist in determining appropriate interventions to support the person to achieve optimum functioning.

Data element attributes

Collection and usage attributes

Guide for use: This data element is used to differentiate between establishments run by the government sector (code 1) and establishments that receive some government funding but are run by the non-government sector (code 2).

CODE 1 is to be used when the establishment:

- operates from the public accounts of a Commonwealth, state or territory government or is part of the executive, judicial or legislative arms of government,

- is part of the general government sector or is controlled by some part of the general government sector,
- provides government services free of charge or at nominal prices, and
- is financed mainly from taxation.

CODE 2 is to be used only when the establishment:

- is not controlled by government,
- is directed by a group of officers, an executive committee or a similar body
- elected by a majority of members, and
- may be an income tax exempt charity.

N8.2.3	Private (profit) domiciliary nursing service

Collection and usage attributes

Guide for use:

Establishments are classified into 10 major types subdivided into major groups:

- residential establishments (R)
- non-residential establishments (N)

CODE R1 Acute care hospitals

Establishments which provide at least minimal medical, surgical or obstetric services for inpatient treatment and/or care, and which provide round-the-clock comprehensive qualified nursing service as well as other necessary professional services. They must be licensed by the state health department, or controlled by government departments. Most of the patients have acute conditions or temporary ailments and the average stay per admission is relatively short.

Hospitals specialising in dental, ophthalmic aids and other specialised medical or surgical care are included in this category. Hospices (establishments providing palliative care to terminally ill patients) that are freestanding and do not provide any other form of acute care are classified to R6.

CODE R2 Psychiatric hospitals

Establishments devoted primarily to the treatment and care of inpatients with psychiatric, mental, or behavioural disorders. Private hospitals formerly approved by the Commonwealth Department of Health under the Health Insurance Act 1973 (Cwlth) (now licensed/approved by each state health authority), catering primarily for patients with psychiatric or behavioural disorders are included in this category.

Centres for the non-acute treatment of drug dependence, developmental and intellectual disability are not included here (see below). This code also excludes institutions mainly providing living quarters or day care.

CODE R3 Nursing homes

Establishments which provide long-term care involving regular basic nursing care to chronically ill, frail, disabled or convalescent persons or senile inpatients. They must be approved by the Commonwealth Department of Health and Family Services and/or licensed by the State, or controlled by Government departments.

Private profit nursing homes are operated by private profit-making individuals or bodies.

Private charitable nursing homes are participating nursing homes operated by religious and charitable organisations.

Government nursing homes are nursing homes either operated by or on behalf of a state or territory Government.

CODE R4 Alcohol and drug treatment centres

Freestanding centres for the treatment of drug dependence on an inpatient basis.

CODE R5 Hostels and residential services

Establishments run by public authorities or registered non-profit organisation to provide board, lodging or accommodation for the aged, distressed or disabled who cannot live independently but do not need nursing care in a hospital or nursing home. Only hostels subsidised by the Commonwealth are included. Separate dwellings are not included, even if subject to an individual rental rebate arrangement. Residents are generally responsible for their own provisions, but may be provided in some establishments with domestic assistance (meals, laundry, personal care). Night shelters providing only casual accommodation are excluded.

CODE R6 Hospices

Establishments providing palliative care to terminally ill patients. Only freestanding hospices which do not provide any other form of acute care are included in this category.

CODE N7 Same-day establishments

This code includes both the traditional day centre/hospital and also freestanding day surgery centres.

Day centres/hospitals are establishments providing a course of acute treatment on a full-day or part-day non-residential attendance basis at specified intervals over a period of time. Sheltered workshops providing occupational or industrial training are excluded.

Freestanding day surgery centres are hospital facilities providing investigation and treatment for acute conditions on a day-only basis and are approved by the Commonwealth for the purposes of basic table health insurance benefits.

CODE N8 Non-residential health services

Services administered by public authorities or registered non-profit organisations which employ full-time equivalent medical or paramedical staff (nurses, nursing aides, physiotherapists, occupational therapists and psychologists, but not trade instructors or teachers). This definition distinguishes health services from welfare services (not within the scope of the National Minimum Data Project) and thereby excludes such services as sheltered workshops, special schools for the intellectually disabled, meals on wheels and baby clinics offering advisory services but no actual treatment. Non-residential health services should be enumerated in terms of services or organisations rather than in terms of the number of sites at which care is delivered.

Non-residential health services provided by a residential establishment (for example, domiciliary nursing service which is part of a public hospital) should not be separately enumerated.

CODE N8.1 Community health centres

Public or registered non-profit establishments in which a range of non-residential health services is provided in an integrated and coordinated manner, or which provides for the coordination of health services elsewhere in the community.

CODE N8.2 Domiciliary nursing service

Public or registered non-profit or profit-making establishments providing nursing or other professional paramedical care or treatment to patients in their own homes or in (non-health) residential institutions. Establishments providing domestic or housekeeping assistance are excluded by the general definition above.

Comments: Note that national minimum data sets currently include only community health centres and domiciliary nursing services.

Data element attributes

Collection and usage attributes

Comments: In the current data element, the term establishment is used in a very broad sense to mean bases, whether institutions, organisations or the community from which health services are provided. Thus, the term covers conventional health establishments and also organisations which may provide services in the community.

This metadata item is currently under review by the Establishments Framework Working Group of the Health Data Standards Committee. Recommendations will provide a comprehensive coverage of the health service delivery sector.

Estimated glomerular filtration rate (eGFR) recorded indicator

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—estimated glomerular filtration rate (eGFR) recorded indicator, yes/no code N
Synonymous names:	eGFR recorded indicator
METeOR identifier:	464961
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a person has had an estimated glomerular filtration rate (eGFR) recorded, as represented by a code.
Data Element Concept:	Person—estimated glomerular filtration rate (eGFR) recorded indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

A person has had an estimated glomerular filtration rate (eGFR) recorded.

CODE 2 No

A person has not had an estimated glomerular filtration rate (eGFR) recorded.

The estimated glomerular filtration rate (eGFR) is a measure of the amount of fluid that passes through the kidneys per unit time.

Extended wait patient

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—extended wait patient indicator, code N
METeOR identifier:	269964
Registration status:	Health, Standard 01/03/2005
Definition:	Whether a patient is an extended wait patient, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—extended wait patient indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Extended wait patient
2	Other patient

Data element attributes

Collection and usage attributes

Guide for use: A patient is classified as an extended wait patient if the patient is in clinical urgency category 3 at the time of admission or at a census time and has been waiting for the elective surgery for more than one year.

Comments: This metadata item is used to identify clinical urgency category 3 patients who had waited longer than one year at admission or have waited longer than one year at the time of a census. An extended wait patient is not an overdue patient as there is no maximum desirable waiting time specified for patients in clinical urgency category 3 as they have been assessed as not having a clinically urgent need for the awaited procedure.

Extent of harm from a health-care incident

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—extent of harm from a health-care incident, code N[N]
Synonymous names:	Severity of loss from a health-care incident
METeOR identifier:	421931
Registration status:	Health, Standard 07/12/2011
Definition:	The extent of overall harm, in terms of impairment, activity limitation or participation restriction, to the patient from a health-care incident, as represented by a code.
Data Element Concept:	Patient—extent of harm from a health-care incident

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

	Value	Meaning
Permissible values:	4	Death
	7	Mild injury
	8	Moderate injury
	9	Severe injury
Supplementary values:	97	Not applicable (no body function or structure affected)
	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 7 Mild injury

'Mild injury' includes situations where the harm results in a mild variation (up to 25%) from accepted population standards in the status of the affected body function or structures.

'Mild' refers to an intensity that a person can tolerate, and is unlikely to be permanent. This category could include, for example, the situation where a patient has suffered mild psychological harm as a result of a misdiagnosis by a general practitioner.

CODE 8 Moderate injury

'Moderate injury' includes situations where the harm results in a moderate variation (between 25–50%) from accepted population standards in the status of the affected body function or structures.

'Moderate' refers to a problem with an intensity which interferes with the person's day to day life, and which may be permanent. This may include, for example, a situation where a patient is administered a medication that was clearly contraindicated, which results in a moderate impairment of hepatic function.

CODE 9 Severe injury

'Severe injury' includes situations where the harm results in a severe variation (more than 50%) from accepted population standards in the status of the affected body function or structures.

'Severe' refers to a problem that has an intensity that partially or completely disrupts the person's day to day life, and which is likely to be permanent. This could include, for example, a situation where an accidental cut, puncture or perforation which occurred during surgery leads to a severe permanent impairment of lower limb function.

In cases where the patient has pre-existing impairments, activity limitations and/or participation restrictions, the coding category chosen should reflect only the additional harm or disability due to the incident, over and above any pre-existing conditions.

CODE 97 Not applicable (no body function or structure affected)

'Not applicable (no body function or structure affected)' includes cases where there is no consequent harm to body functions or structures; for example, failed sterilisation procedure or awareness during a procedure due to anaesthetic failure.

CODE 99 Not stated/inadequately described

'Not stated/inadequately described' should be used when the information is not currently available. This code should also be used where the medical indemnity claim is for fetal distress and the outcome for the child will not be known until some future time.

Comments: The coding categories were developed with reference to the WHO (2003) 'Activity Limitations and Participation Restriction' definitions (ICF Version 2.1a) for 'Mild difficulty', 'Moderate difficulty', 'Severe difficulty' and 'Complete difficulty'.

The categories in this value domain align with the categories in the Australian Prudential Regulation Authority (2006) National Claims and Policies Database data item 17 'Severity of loss'.

Maximum character length: 1

	Value	Meaning
Permissible values:	0	Full participation
	1	Mild participation restriction
	2	Moderate participation restriction
	3	Severe participation restriction
	4	Complete participation restriction
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use: This metadata item contributes to the definition of the concept ‘**Disability**’ and gives an indication of the experience of disability for a person.

In the context of health, participation is involvement in a life situation. Participation restrictions are problems an individual may experience in involvement of life situations.

This metadata item may be used to describe the extent of **participation** in life situations for an individual with a health condition. The standard or norm to which an individual's participation is compared is that of an individual without a similar health condition in that particular society. The participation restriction records the discordance between the experienced participation and the expected participation of an individual without a health condition. The definition of 'particular society' is not specified and will inevitably give rise to different interpretations. If limiting the interpretation, it will be necessary to state the factors which are taken into account, for example, age, gender, ethnicity, religion, education, locality (town, state, rural, remote, urban).

The user will select the code that most closely summarises, in terms of duration, frequency, manner or outcome, the level of participation of the person for whom the data is recorded.

CODE 0 Full participation

Used when the person participates in this life area in the same way in terms of duration, frequency, manner or outcome as other individuals without a similar health condition in that particular society

CODE 1 Mild participation restriction

Used for example, when the person is restricted in their participation less than 25% of the time, and/or with a low alteration in functioning which may happen occasionally over the last 30 days

CODE 2 Moderate participation restriction

Used for example, when the person is restricted in their participation between 26% and 50% of the time with a significant, and/or with a moderate effect on functioning (Up to half the total scale of performance) which may happen regularly over the last 30 days

CODE 3 Severe participation restriction

Used for example, when participation in this life area can be achieved, but only rarely and/or with an extreme effect on functioning which may happen often over the last 30 days

CODE 4 Complete participation restriction

Used when the person can not participate in this life area. This scale has a margin of error of 5%

CODE 8 Not specified

Used when a person's participation in a life area is restricted but there is insufficient information to use codes 0-4

CODE 9 Not applicable

Used when participation in a life area is not relevant, such as employment for an infant.

- WHO ICF website http://www.who.int/classifications/icf/en/
- Australian Collaborating Centre ICF website http://www.aihw.gov.au/disability/icf/index.cfm

Data element attributes

Collection and usage attributes

Guide for use: Extent of participation is always associated with a health condition. For example, a restriction in participation in 'community, social and civic life' may be recorded when the person has had a stroke, but not when the restriction is associated only with personal preferences, without a related health condition. A value is attached to restriction of participation (i.e. a participation restriction is a disadvantage). The value is dependent on cultural norms, so that an individual may be disadvantaged in one group or location and not in another place.

This data element is used in conjunction with a specified

Activities and participation life area (ICF 2001) AN[NNN]. For example, a 'mild restriction in participation in exchange of information'.

Source and reference attributes

External cause

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Injury event—external cause, code (ICD-10-AM 7th edn) ANN{.N[N]}

METeOR identifier: 391330

Registration status: Health, Standard 22/12/2009

Definition: The environmental event, circumstance or condition as the cause of injury, poisoning and other adverse effect, as represented by a code.

Data Element Concept: Injury event—external cause

Value domain attributes

Representational attributes

Classification scheme: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition

Representation class: Code

Data type: String

Format: ANN{.N[N]}

Maximum character length: 6

Data element attributes

Collection and usage attributes

Guide for use: This code must be used in conjunction with an injury or poisoning code and can be used with other disease codes. The external cause should be coded to the complete ICD-10-AM classification.

An external cause code should be sequenced following the related injury or poisoning code, or following the group of codes, if more than one injury or condition has resulted from this external cause. Provision should be made to record more than one external cause if appropriate. External cause codes in the range V00 to Y84 must be accompanied by a place of occurrence code.

External cause codes V00 to Y34 must be accompanied by an activity code.

Comments: Enables categorisation of injury and poisoning according to factors important for injury control. This information is necessary for defining and monitoring injury control targets, injury costing and identifying cases for in-depth research. It is also used as a quality of care indicator of adverse patient outcomes.

An extended activity code is being developed in consultation with the National Injury Surveillance Unit, Flinders University, Adelaide.

Collection and usage attributes

Comments: This code list has been derived from the ICD-10-AM external cause classification.

Source and reference attributes

Reference documents: International Classification of Diseases - Tenth Revision - Australian Modification (3rd edition 2002)

Data element attributes

Collection and usage attributes

Guide for use: This metadata item is for use in injury surveillance purposes only, when it is not possible to use a complete ICD-10-AM code (e.g. Non-admitted patients in emergency departments). Select the item which best characterises the circumstances of the injury, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate select the one that comes first in the code list. The external cause - non-admitted patient group must always be accompanied by an external cause - human intent code (see metadata item Injury event—external cause, non-admitted patient human intent code NN).

Comments: This metadata item has been developed to cater for the information requirements of the wide range of settings where injury surveillance is undertaken and do not have the capability of recording the complete ICD-10-AM external cause codes.
Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

External cause—human intent

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Injury event—human intent of injury, code NN
METeOR identifier:	268944
Registration status:	Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The clinician's assessment identifying the most likely role of human intent in the occurrence of the injury or poisoning, as represented by a code.
Data Element Concept:	Injury event—human intent of injury

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
01	Accident - injury not intended
02	Intentional self-harm
03	Sexual assault
04	Maltreatment by parent
05	Maltreatment by spouse or partner
06	Other and unspecified assault
07	Event of undetermined intent
08	Legal intervention (including police) or operations of war
09	Adverse effect or complications of medical and surgical care
10	Other specified intent

11	Intent not specified

Collection and usage attributes

Guide for use:

Select the code which best characterises the role of intent in the occurrence of the injury, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate, select the one that comes first in the code list. This metadata item must always be accompanied by an Injury event—external cause, non-admitted patient human intent code NN code.

This Value domain is for use in injury surveillance purposes only, when it is not possible to use a complete ICD-10-AM code (e.g. non-admitted patients in emergency departments).

Data element attributes

Collection and usage attributes

Comments:

Enables categorisation of injury and poisoning according to factors important for injury control. This information is necessary for defining and monitoring injury control targets, injury costing and identifying cases for in-depth research.

Family name

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person (name)—family name, text X[X(39)]

Synonymous names: Surname; Last name

METeOR identifier: 286953

Registration status:
Community Services, Superseded 06/02/2012
Housing assistance, Standard 20/06/2005
Health, Standard 04/05/2005
Tasmanian Health, Proposed 28/09/2011

Definition: That part of a name a person usually has in common with some other members of his/her family, as distinguished from his/her given names, as represented by text.

Data Element Concept: Person (name)—family name

Value domain attributes

Representational attributes

Representation class: Text

Data type: String

Format: X[X(39)]

Maximum character length: 40

Data element attributes

Collection and usage attributes

Guide for use: The agency or establishment should record the person's full **family** name on their information systems.

National Community Services Data Dictionary specific:

In instances where there is uncertainty about which name to record for a person living in a remote Aboriginal or Torres Strait Islander community, Centrelink follows the practice of recording the Indigenous person's name as it is first provided to Centrelink. Or, where proof of identity is required, as the name that is recorded on a majority of the higher point scoring documents that are produced as proof of identity.

Collection methods:

This metadata item should be recorded for all persons who receive services from or are of interest to an organisation. For the purposes of positive identification, it may also be recorded for providers of those services who are individuals.

Mixed case should be used.

Family name should be recorded in the format preferred by the person. The format should be the same as that written by the person on a (pre) registration form or in the same format as that printed on an identification card, such as a Medicare card, to ensure consistent collection of name data.

It is acknowledged that some people use more than one family name (e.g. formal name, birth name, married/maiden name, tribal name) depending on the circumstances. Each name should be recorded against the appropriate Name type (see Comments).

A person is able to change his or her name by usage in all States and Territories of Australia with the exception of Western Australia, where a person may only change his or her name under the Change of Name Act. Care should be taken when recording a change of name for a minor. Ideally, the name recorded for the minor should be known to both of his/her parents, so the minor's records can be retrieved and continuity of care maintained, regardless of which parent accompanies the minor to the agency or establishment.

A person should generally be registered using their preferred name as it is more likely to be used in common usage and on subsequent visits to the agency or establishment. The person's preferred name may in fact be the name on their Medicare card. The Person name type metadata item can be used to distinguish between the different types of names that may be used by the person. The following format may assist with data collection:

What is your family name?

____

Are you known by any other family names that you would like recorded? If so, what are they

____

Please indicate, for each name above, the 'type' of family name that is to be recorded:

(a) Medicare card name (if different to preferred name).

(b) Alias (any other name that you are known by). Whenever a person informs the agency or establishment of a change of family name (e.g. following marriage or divorce), the former name should be recorded as an alias name. A full history of names should be retained. e.g. ‘Mary Georgina Smith’ informs the hospital that she has been married and changed her family name to ‘Jones’. Record ‘Jones’ as her preferred family name and record ‘Smith’ as an alias name.

Hyphenated family names:

Sometimes persons with hyphenated family names use only one of the two hyphenated names. It is useful to record each of the hyphenated names as an alias. If the person has a hyphenated family name, e.g. ‘Wilson-Phillips’ record ‘Wilson-Phillips’ in the preferred family name field and record ‘Wilson’ and ‘Phillips’ separately as alias family names.

Punctuation:

If special characters form part of the family name they should be included, e.g. hyphenated names should be entered with a hyphen.

Examples:

- hyphen, e.g. Wilson-Phillips

Do not leave a space before or after a hyphen, i.e. between the last letter of ‘Wilson’ and the hyphen, nor a space between the hyphen and the first letter of ‘Phillips’.

- apostrophe, e.g. O’Brien, D’Agostino

Do not leave a space before or after the apostrophe, i.e. between the ‘O’ and the apostrophe, or a space between the apostrophe and ‘Brien’.

- full stop, e.g. St. John, St. George

Do not leave a space before a full stop, i.e. between ‘St’ and the full stop. Do leave a space between the full stop and ‘John’.

- space, e.g. van der Humm, Le Brun, Mc Donald

If the health care client has recorded their family name as more than one word, displaying spaces in between the words, record their family name in the same way leaving one space between each word.

Registered unnamed newborn babies:

When registering a newborn, use the mother’s family name as the baby’s family name unless instructed otherwise by the mother. Record unnamed babies under the newborn Name type.

Persons with only one name:

Some people do not have a family name and a given name, they have only one name by which they are known. If the person has only one name, record it in the ‘Family name’ field and leave the ‘Given name’ field blank.

Registering an unidentified person:

The default for unknown family name should be unknown in all instances and the name recorded as an alias name. Don’t create a ‘fictitious’ family name such as ‘Doe’ as this is an actual family name. When the person’s name becomes known, record it as the preferred family name and do not overwrite the alias name of unknown.

Registering health care clients from disaster sites:

Persons treated from disaster sites should be recorded under the alias Name Type. Local business rules should be developed for consistent recording of disaster site person details.

Care should be taken not to use identical dummy data (family name, given name, date of birth, sex) for two or more persons from a disaster site.

If the family name needs to be shortened:

If the length of the family name exceeds the length of the field, truncate the family name from the right (that is, dropping the final letters). Also, the last character of the name should be a hash (#) to identify that the name has been truncated.

Use of incomplete names or fictitious names:

Some health care facilities permit persons to use a pseudonym (fictitious or partial name) in lieu of their full or actual name. It is recommended that the person be asked to record both the pseudonym (Alias name) in addition to the person’s Medicare card name.

Baby for **adoption**:

The word adoption should not be used as the family name, given name or alias for a newborn baby. A newborn baby that is for adoption should be registered in the same way that other newborn babies are registered. However, if a baby born in the hospital is subsequently adopted, and is admitted for treatment as a child, the baby is registered under their adopted (current) name, and the record should not be linked to the birth record. This should be the current practice. Any old references to adoption in client registers (for names) should also be changed to unknown. Contact your State or Territory adoption information service for further information.

Prefixes:

Where a family name contains a prefix, such as one to indicate that the person is a widow, this must be entered as part of the 'Family name' field. When widowed, some Hungarian women add 'Ozvegy' (abbreviation is 'Ozy') before their married family name, e.g. 'Mrs Szabo' would become 'Mrs Ozy Szabo'. That is, 'Mrs Szabo' becomes an alias name and 'Mrs Ozy Szabo' becomes the preferred name.

Ethnic Names:

The Centrelink publication, Naming Systems for Ethnic Groups, provides the correct coding for ethnic names.

Misspelled family name:

If the person's family name has been misspelled in error, update the family name with the correct spelling and record the misspelled family name as an alias name. Recording misspelled names is important for filing documents that may be issued with previous versions of the person's name. Discretion should be used regarding the degree of recording that is maintained.

Comments:

Often people use a variety of names, including legal names, married/maiden names, nicknames, assumed names, traditional names, etc. Even small differences in recording - such as the difference between MacIntosh and McIntosh - can make record linkage impossible. To minimise discrepancies in the recording and reporting of name information, agencies or establishments should ask the person for their full (formal) 'Given name' and 'Family name'. These may be different from the name that the person may prefer the agency or establishment workers to use in personal dealings. Agencies or establishments may choose to separately record the preferred names that the person wishes to be used by agency or establishment workers. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies or establishments should always ask the person to specify their first given name and their family name or surname separately. These should then be recorded as 'Given name' and 'Family name' as appropriate, regardless of the order in which they may be traditionally given.

National Community Services Data Dictionary specific:

Selected letters of the family name in combination with selected letters of the given name, date of birth and sex, may be used for record linkage for statistical purposes only.

2	No

Data element attributes

Collection and usage attributes

Guide for use:

The active and routine collection of feedback from clients and/or staff means that, as a matter of routine, the agency initiates and implements feedback mechanisms and does not rely on mechanisms such as ad hoc comments, ad hoc questionnaires, informal debriefing sessions, or similar casual arrangements.

Active mechanisms include the use of periodic questionnaires that are implemented through either face-to-face interviews, by telephone or by mail, focus groups aimed at collecting feedback from the participants, established debriefing sessions, or other routine procedures the agency has in place to collect feedback.

CODE 1 Yes
The service provider organisation actively and routinely collects feedback relating to services and service delivery from clients and staff within the service provider organisation. If feedback is actively and routinely collected from clients only or staff only, this should be recorded as 'No' (Code 2).

CODE 2 No
The service provider organisation does not actively and routinely collect feedback relating to services and service delivery from clients and staff within the service provider organisation.

Collection methods: Record only one code.

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:	Value	Meaning
	1	General practitioner (GP)
	2	Hospital non-specialist (salaried)
	3	Specialist
	4	Specialist-in-training
	5	Other clinician
	6	Non-clinician
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 GENERAL PRACTITIONER

A medical practitioner who works in general practice and has membership with the Royal Australian College of General Practice (RACGP) or who holds a training position supervised by a member of the college. It includes medical practitioners who are currently:

- Vocationally registered
- a RACGP fellow
- a RACGP fellowship trainee
- a GP registrar

CODE 2 HOSPITAL NON-SPECIALIST (SALARIED)

A medical practitioner mainly employed in a salaried position in a hospital who is not in training to gain a recognised specialist qualification. They include interns, Resident Medical Officers (RMOs), and Hospital Medical Officers (HMOs).

CODE 3 SPECIALIST

A medical practitioner with a qualification awarded by, or which equates to that awarded by, the relevant specialist professional college in Australia and works in that speciality area.

CODE 4 SPECIALIST-IN-TRAINING

A medical practitioner who has been accepted by a specialist medical college into a training position supervised by a member of the college and is working in that position.

CODE 5 OTHER CLINICIAN

A medical practitioner that has mainly undertaken clinical work in the week before registration, but who does not fall into any of the above categories.

CODE 6 NON-CLINICIAN

Includes all medical practitioners that have not mainly undertaken clinical work in the week prior to registration.

First day of the last menstrual period

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Pregnancy—first day of the last menstrual period, date DDMMYYYY
METeOR identifier:	270038
Registration status:	Health, Standard 01/03/2005
Definition:	Date of the first day of the mother's last menstrual period (LMP).
Data Element Concept:	Pregnancy—first day of the last menstrual period

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:	If the first day is unknown, it is unnecessary to record the month and year (i.e. record 99999999).
Comments:	The first day of the LMP is required to estimate gestational age, which is a key outcome of pregnancy and an important risk factor for neonatal outcomes. Although the date of the LMP may not be known, or may sometimes be erroneous, estimation of gestational age based on clinical assessment may also be inaccurate. Both methods of assessing gestational age are required for analysis of outcomes.

First language spoken

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—first language spoken, code (ASCL 2011) NN{NN}
METeOR identifier:	460120
Registration status:	Community Services, Standard 13/10/2011 Housing assistance, Standard 13/10/2011 Health, Standard 13/10/2011 Homelessness, Standard 13/10/2011
Definition:	The language the person identifies as being the first language that they could understand to the extent of being able to conduct a conversation, as represented by a code.
Data Element Concept:	Person—first language spoken

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Classification of Languages 2011
Representation class:	Code
Data type:	Number
Format:	NN{NN}
Maximum character length:	4

Collection and usage attributes

Guide for use:

The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure. The most detailed level of the classification consists of base units (languages) which are represented by four-digit codes. The second level of the classification comprises narrow groups of languages (the Narrow group level), identified by the first two digits. The most general level of the classification consists of broad groups of languages (the Broad group level) and is identified by the first digit. The classification includes Australian Indigenous languages and sign languages.

For example, the Lithuanian language has a code of 3102. In this case 3 denotes that it is an Eastern European language, while 31 denotes that it is a Baltic language. The Pintupi Aboriginal language is coded as 8713. In this case 8 denotes that it is an Australian Indigenous language and 87 denotes that the language is a Western Desert language.

Language data may be output at the Broad group level, Narrow group level or base level of the classification. If necessary, significant languages within a Narrow group can be presented separately while the remaining languages in the Narrow group are aggregated. The same principle can be adopted to highlight significant Narrow groups within a Broad group.

Data element attributes

Collection and usage attributes

Collection methods: Data should be captured, classified and stored at the base level of the classification wherever possible as this allows the greatest flexibility for output.

Recommended question:

Which language did you/the person/name first speak as a child?

English
Italian
Greek
Cantonese
Arabic
Mandarin
Vietnamese
Spanish
German
Hindu
Other (please specify)

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, this standard should be used wherever practically possible.

Comments: Persons whose first language is not English have been identified by service providers as a population group that may experience disadvantage when seeking to obtain equal access to government and community programs and services in Australia. Data relating to ‘First language spoken’ may thus provide a surrogate indicator of disadvantage potentially associated with a lack of English competence or with other factors associated with cultural background.

	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes: Record if a foot deformity is present on either foot.

CODE 2 No: Record if no foot deformity is present on either foot.

Common deformities include claw toes, pes cavus, hallux valgus, hallux rigidus, hammer toe, Charcot foot and nail deformity.

Collection methods: Both feet to be examined for the presence of foot deformity.

Comments: Foot deformities are associated with high mechanical pressure on the overlying skin that lead to ulceration in the absence of protective pain sensation and when shoes are unsuitable. Limited joint mobility is often present, with displaced plantar fat pad and more prominent metatarsal heads.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes: Record if a foot ulcer is currently present on either foot.

CODE 2 No: Record if a foot ulcer is not currently present on either foot.

Collection methods: Access whether the individual has a current foot ulcer on either foot.

Assessment

- ask the patient about previous or current foot problems, neuropathic symptoms, rest pain and intermittent claudication;
- inspect the feet (whole foot, nails, between the toes) to identify active foot problems and the 'high-risk foot';
- assess footwear;
- check peripheral pulses;
- examine for neuropathy by testing reflexes and sensation preferably using tuning fork, 10 g monofilament and/or biothesiometer.

Comments: Foot ulcer is usually situated on the edge of the foot or toes because blood supply is the poorest at these sites. In a purely vascular ulcer, nerve function is normal and sensation is intact, hence vascular ulcers are usually painful.

Foot ulcers require urgent care from an interdisciplinary team, which may include a general practitioner, podiatrist, endocrinologist physician, nurse or surgeon.

Full-time equivalent staff (mental health)—all staff

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment (mental health)—full-time equivalent staff (paid), total N[NNN{.N}]
METeOR identifier:	296553
Registration status:	Health, Standard 08/12/2004
Definition:	The aggregate full-time equivalent staff units paid for all staffing categories within a mental health establishment.
Data Element Concept:	Establishment—full-time equivalent staff (paid)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NNN{.N}]
Maximum character length:	5
Unit of measure:	Full-time equivalent (FTE) staff
Unit of measure precision:	1

Data element attributes

Collection and usage attributes

Guide for use:

The total is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

Full-time equivalent staff units are the on-job hours paid for (including overtime) and hours of paid leave of any type for a staff member (or contract employee where applicable) divided by the number of ordinary-time hours normally paid for a full-time staff member when on the job (or contract employee where applicable) under the relevant award or agreement for the staff member (or contract employee occupation where applicable). Hours of unpaid leave are to be excluded.

Contract staff employed through an agency are included where the contract is for the supply of labour (e.g. nursing) rather than of products (e.g. photocopier maintenance). In the former case, the contract would normally specify the amount of labour supplied and could be reported as full-time equivalent units.

Collection methods:

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one hospital (for Public hospitals NMDS) or service unit (for Mental health establishments NMDS), full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments:

This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Collection and usage attributes

Guide for use:

Staff engaged in administrative and clerical duties. Medical staff and nursing staff, diagnostic and health professionals and any domestic staff primarily or partly engaged in administrative and clerical duties are excluded. Civil engineers and computing staff are included in this metadata item.

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

If under the relevant award of agreement a full-time employee is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time employee who works 64 hours is 0.8. If a full-time employee under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments: This metadata item was amended during 1996-97. Representation class:	Average
Data type:	Number
Format:	N[NNN{.N}]
Maximum character length:	5
Unit of measure:	Full-time equivalent (FTE) staff

Data element attributes

Collection and usage attributes

Guide for use:

Carer consultants are persons employed (or engaged via contract) on a part-time or full-time paid basis to represent the interests of carers and advocate for their needs. This implies the person received a salary or contract fee on a regular basis. It does not refer to arrangements where the carer only received reimbursements of expenses or occasional sitting fees for attendance at meetings.

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments: This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Collection and usage attributes

Guide for use: Consumer consultants are persons employed (or engaged via contract) on a part-time or full-time paid basis to represent the interests of consumers and advocate for their needs. This implies the person received a salary or contract fee on a regular basis. It does not refer to arrangements where the consumer only received reimbursements of expenses or occasional sitting fees for attendance at meetings.

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Representational attributes

Representation class: Average

Data type: Number

Format: N[NNN{.N}]

Maximum character length: 5

Unit of measure: Full-time equivalent (FTE) staff

Data element attributes

Collection and usage attributes

Guide for use: Qualified staff (other than qualified medical and nursing staff) engaged in duties of a diagnostic, professional or technical nature (but also including diagnostic and health professionals whose duties are primarily or partly of an administrative nature). This metadata item includes all allied health professionals and laboratory technicians (but excludes civil engineers and computing staff). This metadata item includes full-time equivalent staff units of occupational therapists, social workers, psychologists, and other diagnostic and health professionals.

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

If under the relevant award of agreement a full-time employee is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time employee who works 64 hours is 0.8. If a full-time employee under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments: This metadata item was amended during 1996-97. Persons who are registered as psychologists with the relevant state and territory registration board.

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments:

This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Unit of measure:	Full-time equivalent (FTE) staff

Data element attributes

Collection and usage attributes

Guide for use:

The average is to be calculated from pay period figures. The length of the pay period is assumed to be a fortnight.

If under the relevant award of agreement a full-time nurse is paid for an 80 (ordinary time) hour fortnight, the full-time equivalent for a part-time nurse who works 64 hours is 0.8. If a full-time nurse under the same award is paid for a 100 hours for that fortnight (20 hours overtime), then the full-time equivalent is 100 divided by 80 = 1.25.

Data on full-time equivalent staffing numbers by category should be consistent with data on salaries and wages by staffing category. If the full-time equivalent for contract staff is not collected then salaries for those contract staff should be included in other recurrent expenditure data items.

Where staff provide services to more than one establishment, full-time equivalent staff members should be apportioned between all establishments to which services are provided on the basis of hours paid for in each (salary costs should be apportioned on the same basis).

Comments: This metadata item was amended during 1996-97. Until then, both average and end of year counts of full-time equivalent staff were included, and the end of year counts used as surrogates for the average counts if the latter were unavailable. The average count is more useful for accurate analysis of staffing inputs for establishment outputs and for assessments and comparisons of labour costs.

Fully immunised recorded indicator

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Child—fully immunised recorded indicator, yes/no code N
METeOR identifier:	457664
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a child has been recorded as fully immunised, as represented by a code.
Data Element Concept:	Child—recorded as fully immunised indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes

A child is recorded as fully immunised.

CODE 2 No

A child is not recorded as fully immunised.

Comments: 'Fully immunised' status is determined in accordance with the National Immunisation Program Schedule. The childhood vaccinations essential to be considered 'fully immunised' include:

- DTPa (diphtheria, tetanus, pertussis)
- HiB (haemophilus influenzae type B)
- Polio
- Hep B (hepatitis B)
- MMR (measles, mumps, rubella).

A child is considered 'fully immunised' if they have received the following vaccinations by the specified age milestones:

- At 12 months: 3 doses DTPa; 3 doses Polio; 2 or 3 doses HiB; 2 or 3 doses Hep B
- At 24 months: 3 doses DTPa; 3 doses Polio; 3 or 4 doses HiB; 3 doses Hep B; 1 dose MMR
- At 60 months: 4 doses DTPa; 4 doses Polio; 2 doses MMR.

Functional stress ischaemic and perfusion outcome result

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Functional stress test—ischaemic and perfusion outcome result, code N
Synonymous names:	Functional stress test result
METeOR identifier:	349703
Registration status:	Health, Standard 01/10/2008
Definition:	The result of the person's functional stress test in terms of ischaemic and perfusion outcomes, as represented by a code.
Data Element Concept:	Functional stress test—ischaemic and perfusion outcome result

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	No abnormal outcome
	2	Ischaemic discomfort and/or ST shift
	3	Fixed perfusion or wall motion defects only
	4	Reversible perfusion or wall motion defects only
	5	Fixed and reversible perfusion and wall motion defects
	6	Equivocal
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Depending on the method used for the stress test, and therefore the way the results are viewed, some of these codes will not be applicable. For example where an ECG was used for the stress test codes 3, 4 and 5 will not be applicable.

CODE 1   No abnormal outcome

Use this code when the stress test result identifies no evidence of ischaemia (i.e. no typical angina pain and no ST shifts).

CODE 2   Ischaemic discomfort and/or ST shift

Use this code when the stress test result identifies either:

- Both ischaemic discomfort and ST shift greater than or equal to 1 mm (0.1 mV) (horizontal or downsloping); or
- new ST shift greater than or equal to 2 mm (0.2 mV) (horizontal or down-sloping) believed to represent ischaemia even in the absence of ischaemic discomfort.

This code only applies to stress tests where no imaging component was performed.

CODE 3   Fixed perfusion or wall motion defects only

Use this code when the stress test result identifies fixed perfusion defects only. This means the presence of non-viable myocardium with no areas of inducible ischaemia during functional stress testing.

This code only applies to stress tests where an imaging component was performed.

CODE 4   Reversible perfusion or wall motion defects only

Use this code when the stress test result identifies reversible perfusion defects only. This means the presence of inducible defects in myocardial perfusion with underlying viable myocardium in all areas.

This code only applies to stress tests where an imaging component was performed.

CODE 5   Fixed and reversible perfusion or wall motion defects

Use this code when the stress test result identifies reversible and fixed perfusion defects. This means the presence of non-viable myocardial areas, together with areas of inducible defects in reperfusion.

This code only applies to stress tests where an imaging component was performed.

CODE 6   Equivocal

Use this code when the stress test result identifies either:

- Typical ischaemic pain but no ST shift greater than or equal to 1 mm (0.1 mV) (horizontal or downsloping); OR ST shift of 1 mm (0.1 mV) (horizontal or downsloping) but no ischaemic discomfort.
- Defect on myocardial imaging of uncertain nature or significance.

Collection and usage attributes

Guide for use:

CODE 01 Australian Health Care Agreements

Australian Health Care Agreements should be recorded as the funding source for Medicare eligible admitted patients who elect to be treated as public patients and Medicare eligible emergency department patients and Medicare eligible patients presenting at a public hospital outpatient department for whom there is not a third party arrangement.

Includes: Public admitted patients in private hospitals funded by state or territory health authorities (at the state or regional level).

Excludes: Inter-hospital contracted patients and overseas visitors who are covered by Reciprocal health care agreements and elect to be treated as public admitted patients.

CODE 02 Private health insurance

Excludes: overseas visitors for whom travel insurance is the major funding source.

CODE 03 Self-funded

This code includes funded by the patient, by the patient's family or friends, or by other benefactors.

CODE 10 Other hospital or public authority

Includes: Patients receiving treatment under contracted care arrangements (Inter-hospital contracted patient).

CODE 11 Reciprocal health care agreements (with other countries)

Australia has Reciprocal Health Care Agreements with the

United Kingdom, the Netherlands, Italy, Malta, Sweden, Finland, Norway, New Zealand and Ireland. The Agreements provide for free accommodation and treatment as public hospital services, but do not cover treatment as a private patient in any kind of hospital.

– The Agreements with Finland, Italy, Malta, the Netherlands, Norway, Sweden and the United Kingdom provide free care as a public patient in public hospitals, subsidised out-of-hospital medical treatment under Medicare, and subsidised medicines under the Pharmaceutical Benefits Scheme.

– The Agreements with New Zealand and Ireland provide free care as a public patient in public hospitals and subsidised medicines under the Pharmaceutical Benefits Scheme, but do not cover out-of-hospital medical treatment.

– Visitors from Italy and Malta are covered for a period of six months from the date of arrival in Australia only.

Excludes: Overseas visitors who elect to be treated as private patients.

CODE 12 Other funding source

Includes: Overseas visitors for whom travel insurance is the major funding source.

CODE 13 No charge

Includes: Admitted patients who are Medicare ineligible and receive public hospital services free of charge at the discretion of the hospital or the state/territory. Also includes patients who receive private hospital services for whom no accommodation or facility charge is raised (for example, when the only charges are for medical services bulk-billed to Medicare), and patients for whom a charge is raised but is subsequently waived.

Excludes: Admitted public patients (Medicare eligible) whose funding source should be recorded as Australian Health Care Agreements or Reciprocal Health Care Agreements. Also excludes Medicare eligible non-admitted patients, presenting to a public hospital emergency department and Medicare eligible patients (for whom there is not a third party payment arrangement) presenting at a public hospital outpatient department, whose funding source should be recorded as Australian Health Care Agreements.

Also excludes patients presenting to an outpatient department who have chosen to be treated as a private patient and have been referred to a named medical specialist who is exercising a right of private practice. These patients are not considered to be patients of the hospital (see Guide for use).

Data element attributes

Collection and usage attributes

Guide for use:

If there is an expected funding source followed by a finalised actual funding source (for example, in relation to compensation claims), then the actual funding source known at the end of the reporting period should be recorded.

The expected funding source should be reported if the fee has not been paid but is not to be waived.

If a charge is raised for accommodation or facility fees for the episode/service event, the intent of this data element is to collect information on who is expected to pay, provided that the charge would cover most of the expenditure that would be estimated for the episode/service event. If the charge raised would cover less than half of the expenditure, then the funding source that represents the majority of the expenditure should be reported.

The major source of funding should be reported for nursing-home type patients.

Funding source for hospital patient

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—source of funding, patient funding source code NN

METeOR identifier: 472033

Registration status: Health, Standard 11/04/2012

Definition: The source of funds for an admitted patient episode or non-admitted patient service event, as represented by a code.

Context: Admitted patient care.

Hospital non-admitted patient care.

Data Element Concept: Episode of care—source of funding

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: NN

Maximum character length: 2

Permissible values:

Value	Meaning
01	Health service budget (not covered elsewhere)
02	Health service budget (due to eligibility for Reciprocal Health Care Agreement)
03	Health service budget (no charge raised due to hospital decision)
04	Department of Veterans' Affairs
05	Department of Defence
06	Correctional facility
07	Medicare Benefits Scheme
08	Other hospital or public authority (contracted care)

	09	Private health insurance
	10	Worker’s compensation
	11	Motor vehicle third party personal claim
	12	Other compensation (e.g. public liability, common law, medical negligence)
	13	Self-funded
	88	Other funding source
Supplementary values:	98	Not known

Collection and usage attributes

Guide for use:

CODE 01 Health service budget (not covered elsewhere)

Health service budget (not covered elsewhere) should be recorded as the funding source for Medicare eligible patients for whom there is no other funding arrangement.

CODE 02 Health service budget (due to eligibility for Reciprocal Health Care Agreement)

Patients who are overseas visitors from countries covered by Reciprocal Health Care Agreements.

Australia has Reciprocal Health Care Agreements with the United Kingdom, the Netherlands, Italy, Malta, Sweden, Finland, Norway, Belgium, Slovenia, New Zealand and Ireland. The Agreements provide for free accommodation and treatment as public hospital services, but do not cover treatment as a private patient in any kind of hospital.

The Agreements with Finland, Italy, Malta, the Netherlands, Norway, Sweden, Belgium, Slovenia and the United Kingdom provide free care as a public patient in public hospitals, subsidised out-of-hospital medical treatment under Medicare, and subsidised medicines under the Pharmaceutical Benefits Scheme.

The Agreements with New Zealand and Ireland provide free care as a public patient in public hospitals and subsidised medicines under the Pharmaceutical Benefits Scheme, but do not cover out-of-hospital medical treatment.

Visitors from Italy and Malta are covered for a period of six months from the date of arrival in Australia only.

Visitors from Belgium, the Netherlands and Slovenia require their European Health Insurance card to enrol in Medicare. They are eligible for treatment in public hospitals until the expiry date indicated on the card, or to the length of their authorised stay in Australia if earlier.

Excludes: Overseas visitors who elect to be treated as private patients or under travel insurance.

CODE 03 Health service budget (no charge raised due to hospital decision)

Patients who are Medicare ineligible and receive public hospital services free of charge at the discretion of the hospital or the state/territory. Also includes patients who receive private hospital services for whom no accommodation or facility charge is raised (for example, when the only charges are for medical services bulk-billed to Medicare) and patients for whom a charge is raised but is subsequently waived.

CODE 07 Medicare Benefits Scheme

Medicare eligible patients presenting at a public hospital for whom services are billed to Medicare. Includes both bulk-billed patients and patients with out-of-pocket expenses. This value is not applicable for admitted patients.

CODE 08 Other hospital or public authority (contracted care)

Patients receiving treatment under contracted arrangements with another hospital (inter-hospital contracted patient) or a public authority (e.g. a state or territory government).

CODE 09 Private health insurance

Patients who are funded by private health insurance, including travel insurance for Medicare eligible patients. If patients receive any funding from private health insurance, choose Code 09, regardless of whether it is the majority source of funds.

Excludes: Overseas visitors for whom travel insurance is the major funding source.

CODE 13 Self-funded

This code includes funded by the patient, by the patient's family or friends, or by other benefactors.

CODE 88 Other funding source

This code includes overseas visitors for whom travel insurance is the major funding source.

Data element attributes

Collection and usage attributes

Guide for use:

The source of funding should be assigned based on a best estimate of where the majority of funds come from, except for private health insurance, which should be assigned wherever there is a private health insurance contribution to the cost. This data element is not designed to capture information on out-of-pocket expenses to patients (for example, fees only partly covered by the Medicare Benefits Schedule).

If a charge is raised for accommodation or facility fees for the episode/service event, the intent of this data element is to collect information on who is expected to pay, provided that the charge would cover most of the expenditure that would be estimated for the episode/service event. If the charge raised would cover less than half of the expenditure, then the funding source that represents the majority of the expenditure should be reported.

If there is an expected funding source followed by a finalised actual funding source (for example, in relation to compensation claims), then the actual funding source known at the end of the reporting period should be recorded.

The expected funding source should be reported if the fee has not been paid but is not to be waived.

The major source of funding should be reported for nursing-home type patients.

Geographic remoteness—admitted patient care

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—geographic remoteness, admitted patient care remoteness classification (ASGC-RA) N
Synonymous names:	Geographic remoteness of establishment
METeOR identifier:	461473
Registration status:	Health, Standard 07/12/2011
Definition:	The remoteness of an establishment providing admitted patient care, based on the physical road distance to the nearest urban centre and its population size, as represented by a code.
Data Element Concept:	Establishment—geographic remoteness

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Geographical Classification 2010
Representation class:	Code
Data type:	String
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
0	Major cities of Australia
1	Inner regional Australia
2	Outer regional Australia
3	Remote Australia
4	Very remote Australia

	5	Migratory
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

This value domain is intended exclusively for use when collecting data relating to admitted patient care.

CODE 0 Major cities of Australia

'Major cities of Australia' includes Census Collection Districts (CDs) with an average Accessibility/Remoteness Index of Australia (ARIA+) index value of 0 to 0.2.

CODE 1 Inner regional Australia

'Inner regional Australia' includes CDs with an average ARIA+ index value greater than 0.2 and less than or equal to 2.4.

CODE 2 Outer regional Australia

'Outer regional Australia' includes CDs with an average ARIA+ index value greater than 2.4 and less than or equal to 5.92.

CODE 3 Remote Australia

'Remote Australia' includes CDs with an average ARIA+ index value greater than 5.92 and less than or equal to 10.53.

CODE 4 Very remote Australia

'Very remote Australia' includes CDs with an average ARIA+ index value greater than 10.53.

CODE 5 Migratory

'Migratory' is composed of off-shore, shipping and migratory CDs.

This value domain allows for the allocation of remoteness codes in accordance with those used by the Australian Bureau of Statistics (ABS) remoteness structure. It is intended exclusively for use in the collection of admitted patient care data, where historically data has been remoteness coded to the value range 0-5. The similarly structured value domain, using the value range 1-6 for remoteness, should be used wherever possible (see the 'Related metadata references' section below).

Collection methods:

In this value domain, physical distance is defined in terms of ARIA+ codes, rather than a simple linear distance between points.

The list of permissible values for this value domain, i.e. codes 0 to 5, is the same as that used by the ABS to describe remoteness areas, i.e. codes 0 to 5, and is directly to mappable to the code range used 1-6 in the related value domain linked below (see the 'Related metadata references' section).

Comments:

In its initial form, as developed by GISCA and the then Department of

Health and Aged Care in 1999, ARIA scores ranged from 0 to 12 and were based on proximity to 4 points of reference.

A new version, ARIA+, was introduced in 2003, with ARIA+ scores now based on proximity to 5 points of reference. Also, changes were made to allow for more accurate estimation of the cost of travelling from Tasmania to the mainland, and to increase accuracy for locations at the urban fringe.

The geographical location is reported using a five digit numerical code to indicate the Statistical Local Area (SLA) within the reporting state or territory, as defined in the Australian Standard Geographical Classification (ASGC) (Australian Bureau of Statistics (ABS), catalogue number 1216.0). It is a composite of state/territory identifier and SLA (first digit = state/territory identifier, next four digits = SLA).

The Australian Standard Geographical Classification (ASGC) is updated by the ABS on an annual basis, with a date of effect of 1 July each year.

Up until 2007, the ABS's National Localities Index (NLI) (catalogue number 1252.0.55.001) was available as a coding tool designed to assist users assign the ASGC Main Structure codes to street address information. However, the NLI is no longer produced by the ABS. To replace the Localities file of the NLI, the ABS has created a Locality to SLA correspondence file for 2011. This file is available on request by contacting ABS Geography at geography@abs.gov.au.

Maximum character length:	2

Supplementary values:

Value	Meaning
99	Not stated/unknown

Unit of measure: Completed weeks

Data element attributes

Collection and usage attributes

Guide for use:

Gestational age is the best clinical estimate of the duration of pregnancy at a specific point in time, based on the first day of the last menstrual period, ultrasound or physical examination of the baby.

Gestational age is conventionally expressed in completed weeks. When gestational age is calculated using the first day of the last normal menstrual period, the first day is counted as day zero and not day one. Therefore, a 25 week, 5 day fetus is considered a 25 week fetus (25+0, 25+1, 25+2, 25+3, 25+4, 25+5, 25+6).

When ultrasound is used to date a pregnancy, the earliest ultrasound examination should be used and should preferably be between 6 and 10 weeks gestation. Scans performed beyond 24 weeks gestation are unlikely to be reliable in estimating gestational age and should not be used for this purpose.

The duration of gestation can be determined from the first day of the last normal menstrual period, from ultrasound or clinical assessment. For the purpose of the national collection, gestational age is expressed in completed weeks.

The World Health Organisation identifies the following categories:

- pre-term: less than 37 completed weeks (less than 259 days) of gestation;
- term: from 37 completed weeks to less than 42 completed weeks (259 to 293 days) of gestation; and
- post-term: 42 completed weeks or more (294 days or more) of gestation.

Comments: Gestational age is a key marker in pregnancy and an important risk factor for neonatal outcomes.

Given name sequence number

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person (name)—given name sequence number, code N
METeOR identifier:	287595
Registration status:	Community Services, Standard 30/09/2005 Health, Standard 04/05/2005
Definition:	The numerical order of the given names or initials of a person, as represented by a code.
Data Element Concept:	Person (name)—given name sequence number

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	First given name
2	Second given name
3	Third given name
4	Fourth given name
5	Fifth given name
6	Sixth given name
7	Seventh given name
8	Eighth given name
9	Ninth and subsequent given name

Data element attributes

Collection and usage attributes

Guide for use: To be used in conjunction with Given name.
Example: Mary Georgina Smith

In the example above 'Mary' would have a given name sequence number of 1 and 'Georgina' would have a given name sequence number of 2.

Example: Jean Claude Marcel Moreaux

If the person has recorded a single given name as more than one word, displaying spaces in between the words(e.g. Jean Claude), their given names are recorded in data collection systems in the same way (i.e. Jean Claude is one given name and Marcel is another given name). 'Jean Claude' would have a Given name sequence number of '1' and 'Marcel' would have a Given name sequence number of '2'.

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	[X(40)]
Maximum character length:	40

Data element attributes

Collection and usage attributes

Guide for use:

A person may have more than one Given name. All given names should be recorded.

The agency or establishment should record the person's full given name(s) on their information systems.

National Community Services Data Dictionary specific:

In instances where there is uncertainty about which name to record for a person living in a remote Aboriginal or Torres Strait Islander community, Centrelink follows the practice of recording the Indigenous person's name as it is first provided to Centrelink. In situations where proof of identity is required, the name is that recorded on a majority of the higher point scoring documents that are produced as proof of identity.

National Health Data Dictionary specific:

Each individual Given name should have a Given name sequence number associated with it.

Health care establishments may record given names (first and other given names) in one field or several fields. This metadata item definition applies regardless of the format of data recording.

A full history of names is to be retained.

Collection methods:

This metadata item should be recorded for all clients.

Given name(s) should be recorded in the format preferred by the person. The format should be the same as that indicated by the person (for example written on a form) or in the same format as that printed on an identification card, such as Medicare card, to ensure consistent collection of name data.

It is acknowledged that some people use more than one given name (for example formal name, birth name, nickname or shortened name, or tribal name) depending on the circumstances. A person is able to change his or her name by usage in all States and Territories of Australia with the exception of Western Australia, where a person may only change his or her name under the Change of Name Act.

A person should generally be registered using their preferred name as it is more likely to be used in common usage and on subsequent visits to the agency or establishment. The person's preferred name may in fact be their legal (or Medicare card) name. The Person name type metadata item (see Comments) can be used to distinguish between the different types of names that may be used by the person.

The following format may assist with data collection:

What is the given name you would like to be known by?

____

Are you known by any other given names that you would like recorded?

If so, what are they

____

Please indicate the 'type' of given name that is to be recorded:

(a) Medicare card name (if different to preferred name).

(b) Alias (any other name that you are known by).

Whenever a person informs the agency or establishment of a change of given name (for example prefers to be know by their middle name), the former name should be recorded according to the appropriate name type. Do not delete or overwrite a previous given name. For example 'Mary Georgina Smith' informs the hospital that she prefers to be known as 'Georgina'. Record 'Georgina' as her preferred given name and record 'Mary' as the Medicare card given name.

Similarly the establishment is informed that 'Baby of Louise Jones' has been named 'Mary Jones'. Retain 'Baby of Louise' as the newborn name and also record 'Mary' as the preferred 'Given name'.

Registering an unidentified health care client:

If the person is a health care client and her/his given name is not known record unknown in the 'Given name' field and use alias Name type. When the person's name becomes known, add the actual name as preferred Name type (or other as appropriate). Do not delete or overwrite the alias name of unknown.

Use of first initial:

If the person's given name is not known, but the first letter (initial) of the given name is known, record the first letter in the preferred 'Given name' field. Do not record a full stop following the initial.

Persons with only one name:

Some people do not have a **family** name and a given name: they have only one name by which they are known. If the person has only one name, record it in the 'Family name' field and leave the 'Given name' blank.

Record complete information:

All of the person's given names should be recorded.

Shortened or alternate first given name:

If the person uses a shortened version or an alternate version of their first given name, record their preferred name, the actual name as their Medicare card name and any alternative versions as alias names as appropriate.

Example - The person's given name is Jennifer but she prefers to be called Jenny. Record 'Jenny' as the preferred 'Given name' and 'Jennifer' as her Medicare card name.

Example - The person's given name is 'Giovanni' but he prefers to be called 'John'.

Record 'John' as the preferred 'Given name' and 'Giovanni' as the Medicare card name.

Punctuation:

If special characters form part of the given names they shall be included, e.g. hyphenated names shall be entered with the hyphen.

- Hyphen, for example Anne-Maree, Mary-Jane

Do not leave a space before or after the hyphen, that is between last letter of 'Anne' and the hyphen, nor a space between the hyphen and the first letter of 'Maree'.

- spaces, for example Jean Claude Marcel Moreaux

If the person has recorded their given name as more than one word, displaying spaces in between the words, record their given names in data collection systems in the same way (that is Jean Claude is one given name and Marcel is another given name).

Names not for continued use:

For cultural reasons, a person such as an Aboriginal or Torres Strait Islander may advise that they are no longer using the given name they previously used and are now using an alternative current name. Record their current name as their preferred given name and record their previously used name as an alias name (with a Name conditional use flag of 'not for continued use').

Composite name:

If a person identifies their first name as being a composite word,

both parts should be recorded under the first Given Name (rather than the first and second Given Name).
If ʻAnne Marie Walker' notes her preferred Given Name to be ʻAnne Marie', then ʻAnne Marie' is recoded as (first) Given Name, and (second) Given Name is left blank.

Registering an unnamed newborn baby:

An unnamed (newborn) baby is to be registered using the mother's given name in conjunction with the prefix 'Baby of'. For example, if the baby's mother's given name is Fiona, then record 'Baby of Fiona' in the preferred 'Given name' field for the baby. This name is recorded under the newborn Name type. If a name is subsequently given, record the new name as the preferred given name and retain the newborn name.

Registering unnamed multiple births:

An unnamed (newborn) baby from a multiple birth should use their mother's given name plus a reference to the multiple births. For example, if the baby's mother's given name is 'Fiona' and a set of twins is to be registered, then record 'Twin 1 of Fiona' in the Given name field for the first born baby, and 'Twin 2 of Fiona' in the 'Given name' field of the second born baby. Arabic numbers (1, 2, 3 ...) are used, not Roman Numerals (I, II, III ......).

In the case of triplets or other multiple births the same logic applies. The following terms should be use for recording multiple births:

- Twin:

use Twin, that is Twin 1 of Fiona

- Triplet:

use Trip, that is Trip 1 of Fiona

- Quadruplet:

use Quad, that is Quad 1 of Fiona

- Quintuplet:

use Quin, that is Quin 1 of Fiona

- Sextuplet:

use Sext, that is Sext 1 of Fiona

- Septuplet:

use Sept, that is Sept 1 of Fiona.

These names should be recorded under the newborn Person name type. When the babies are named, the actual names should be recorded as the preferred name. The newborn name is retained.

Ethnic Names:

The Centrelink Naming Systems for Ethnic Groups publication provides the correct coding for ethnic names. Refer to Ethnic Names

Condensed Guide for summary information.

Misspelled given names:

If the person's given name has been misspelled in error, update the Given name field with the correct spelling and record the misspelled given name as an Alias name. Recording misspelled names is important for filing documents that may be issued with previous versions of the client's name. Discretion should be used regarding the degree of recording that is maintained.

Comments: Often people use a variety of names, including legal names, married/maiden names, nicknames, assumed names, traditional names, etc. Even small differences in recording - such as the difference between Thomas and Tom - can make Record linkage impossible. To minimise discrepancies in the recording and reporting of name information, agencies or establishments should ask the person for their full (formal) Given name and Family name. These may be different from the name that the person may prefer the agency or establishment workers to use in personal dealings. Agencies or establishments may choose to separately record the preferred name that the person wishes to be used by agency or establishment workers. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies or establishments should always ask the person to specify their first given name and their family or surname separately. These should then be recorded as Given name and Family name as appropriate, regardless of the order in which they may be traditionally given.

National Community Services Data Dictionary specific:

Selected letters of the given name in combination with selected letters of the family name, date of birth and sex may be used for **record linkage** for statistical purposes only.

National Health Data Dictionary specific:

Health care provider identification DSS and Health care client identification DSS
For the purpose of positive identification or contact, agencies or establishments that collect Given name should also collect Given name sequence number. Given name sequence number is also a metadata item in Australian Standard AS4846-2004 Health care provider identification and is proposed for inclusion in the review of Australian Standard AS5017-2002 Health care client identification. AS5017 and AS4846 use alternative alphabetic codes for Given name sequence number. Refer to the current standards for more details.

Maximum character length:	3

Supplementary values:

Value	Meaning
99.9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

HbA1c results vary between laboratories; use the same laboratory for repeated testing.

When reporting, record absolute result of the most recent HbA1c level in the last 12 months.

Record the absolute result of the test (%).

Collection methods:

Test is performed in accredited laboratories:

- A single blood sample is sufficient and no preparation of the patient is required.
- Measure HbA1c ideally using High Performance Liquid Chromatography (HPLC).

05	Person in end-stage of illness the goal is aimed at support to stay at home in comfort and dignity and facilitation of choice of where to die
06	Person is unable to remain at home for extended period and goal is aimed at institutionalisation at a planned and

appropriate time

07 For assessment only/not applicable

Collection and usage attributes

Guide for use:

CODE 01 Well person for preventative/maintenance/health promotion program

Service recipients are those making contact with the health service primarily as a part of a preventative/maintenance health promotion program. This means they are well and do not require care for established health problems. They include well antenatal persons attending or being seen by the service for screening or health education purposes.

CODE 02 Person will make a complete recovery

Describes those persons whose condition is self-limiting and from which complete recovery is anticipated, or those with established or long-term health problems who are normally independent in their management.

Goal 2 service recipient includes:

- post-surgical or acute medical service recipients whose care at home is to facilitate convalescence. Such admissions to home care occur as a result of early discharge from hospital; post-surgical complication such as wound infection; or because the person is at risk during the recovery phase and requires surveillance for a limited period;
- persons recovering from an acute illness and referred from the general practitioner or other community-based facility;
- persons with **disability** or established health problem normally independent of health services, and currently recovering from an acute condition or illness as above.

CODE 03 Person will not make a complete recovery; but will rehabilitate to a state where formal on-going service is no longer required

Refers to those service recipients whose care plan is aimed at returning them to independent functioning at home either through self-care or with informal assistance, such that formal services will be discontinued. The distinguishing characteristic of this group is that complete recovery is not expected but some functional gain may be possible. Further, the condition is not expected to deteriorate rapidly or otherwise cause the client to be at risk without contact or surveillance from the community service.

CODE 04 Person has a long-term care need and the goal is aimed at on-going support to maintain at home

Refers to those service recipients whose health problem/condition is not expected to resolve and who will require ongoing maintenance care from the nursing service. Such clients are distinguished from those in Goal 3 in that their condition is of an unknown or long-term nature and not expected to cause death in the foreseeable future. They may require therapy for restoration of function initially and intermittently, and may also have intermittent admissions for respite. However, the major part of their care is planned to be at home.

CODE 05 Person in end-stage of illness the goal is aimed at support to stay at home in comfort and dignity and facilitation of choice of where to die

Refers to persons whose focus of care is palliation of symptoms and facilitation of the choice to die at home.

CODE 06 Person is unable to remain at home for extended period and goal is aimed at institutionalisation at a planned and appropriate time

Includes persons who have a limited ability to remain at home because of their intensive care requirements and the inability of formal and informal services to meet these needs. Admission to institutional care is therefore a part of the care planning process and the timing dependent upon the capacity and/or wish to remain at home. The distinguishing feature of this group is that the admission is not planned to be an intermittent event to boost the capacity for home care but is expected to be of a more permanent (or indeterminate) nature.

- Excluded from this group are persons with established health problems or permanent disability, if the contact is related to the condition. For example, persons with diabetes and in a diabetes program would be included in Goal 3; however, such persons would be included in Goal 6 if the contact with the service is not related to an established health problem but is primarily for preventative/maintenance care as described above.

CODE 07 For assessment only/not applicable

Service recipients are those for whom the reason for the visit is to undertake an assessment. This may include clients in receipt of a Domiciliary Nursing Care Benefit (DNCB) for whom the purpose of the visit is to determine ongoing DNCB eligibility and requirements for care. Implicit in this visit is review of the person's health status and circumstances, to ensure that their ongoing support does not place them or their carer at avoidable risk.

Data element attributes

Collection and usage attributes

Guide for use: Only one option is permissible and where Code 07 is selected, Code 9 must be used in the metadata item Community nursing service episode—nursing interventions, code N.

Collection methods: At time of formal review of the client, the original goal of care should be retained and not over-written by the system. The goal of care relates to the episode bounded by the date of first contact with community nursing service and date of last contact and in this format provides a focussing effect at the time of planning for care.

Comments: Agencies who had previously implemented this metadata item should note changes to the code set in the Value domain.

Source and reference attributes

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

A person has received a GP Management Plan.

CODE 2 No

A person has not received a GP Management Plan.

Comments:

The Chronic Disease Management Medicare items on the Medicare Benefits Schedule enable GPs to plan and coordinate the health care of patients with chronic or terminal medical conditions. This item is designed for patients who require a structured approach to their care. To be eligible for a GP Management Plan (GPMP) a patient must have a chronic (or terminal) medical condition; one that has been or is likely to be present for 6 months or longer, including, but not limited to asthma, cancer, cardiovascular illness, diabetes mellitus and musculoskeletal conditions (Department of Health and Ageing 2011a).

A GPMP is required by legislation to be a comprehensive written plan that describes:

- the patient's health care needs, health problems and relevant conditions
- management goals with which the patient agrees
- actions to be taken by the patient
- treatment and services the patient is likely to need
- arrangements for providing these treatment and services

- a date to review these matters (Department of Health and Ageing 2011b).

This chronic disease management service is for a patient who has at least one medical condition that:

(a) has been (or is likely to be) present for at least six months; or

(b) is terminal (Department of Health and Ageing 2011c).

Grants to non-government organisations—accommodation services

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Specialised mental health service organisation—accommodation services grants to non-government organisations, total Australian currency N[N(8)]
METeOR identifier:	398477
Registration status:	Health, Standard 01/12/2010
Definition:	The value of grants made to non-government organisations for the provision of accommodation services, defined as housing services that are linked to support services for people affected by a mental health issue, in Australian dollars.
Data Element Concept:	Specialised mental health service organisation—accommodation services grants to non-government organisations

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Currency
Format:	N[N(8)]
Maximum character length:	9
Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:

Where the exact dollar amount, for accommodations services as a whole, is unable to be provided an estimate should be derived from available local information.

Where data are unavailable on grant amounts for specific service types, the value of grants not allocatable to specific service types should be reported under the *Specialised mental health service organisation—other and unspecified mental health services grants to non-government organisations, total*

Australian currency N[N(8)] data element.

Accommodation services are subcategorised into 5 subtypes:

1. *Crisis/interim accommodation* - Short-term accommodation which may be staffed up to 24 hours a day, seven days a week for people affected by a mental health issue. Accommodation is residential/facility based with an average of 4-8 beds. Length of stay is generally limited to a maximum of three months.
2. *Transitional supported accommodation* - Short to medium-term accommodation (3-12 months) that is provided in a residential/facility based setting.
3. *Headleasing* - Provides a supportive landlord service that assists tenants to access and maintain suitable accommodation and maintains their tenancies and which is linked to support.
4. *Residential rehabilitation* - Short to long-term residential/facility based accommodation provided to people with high needs. Staff support is provided.
5. *Long-term supported accommodation* - Secure/tenured long-term accommodation with staff support as necessary or desired.

Note: If any of the above accommodation services are staffed by mental health trained staff for at least 50 hours per week with at least 6 hours staffing on any single day, the accommodation services and their associated expenditure should be reported as a residential mental health care service. For information on what constitutes a residential service setting, please refer to the glossary item for **Residential mental health care service**.

Collection methods: Grants for accommodation services are to be reported at the lowest statistical unit level at which the expenditure occurred (state/territory or region), and should not be counted at more than one level.

Grants to non-government organisations—counselling services

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Specialised mental health service organisation—counselling services grants to non-government organisations, total Australian currency N[N(8)]

METeOR identifier: 287021

Registration status: Health, Standard 08/12/2004

Definition: Grants made to non-government organisations for counselling services provided by professionals and non-professionals that provide emotional support, psychological support, assistance with achieving goals and the strengthening of community and social networks for people affected by a mental health issue.

Data Element Concept: Specialised mental health service organisation—counselling services grants to non-government organisations

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Where the exact dollar amount for counselling services is unable to be provided an estimate should be derived from available local information. Where data are unavailable on grant amounts for specific service types, the value of grants not allocatable to specific service types should be reported under other and unspecified services grants to non-government organisations.

Collection methods: Grants for counselling services are to be reported only at the level at which the expenditure occurred (state/territory or region), and should not be counted at more than one level.

Guide for use: **Yes - Group service event**

'Yes' indicates care that has been provided to two or more patients by the same healthcare provider(s) at the same time.

A group must have two or more persons attending in the capacity of patients in their own right.

One service event is recorded for each patient who attends a group session.

Spouses, parents or carers attending the session are counted for the group session only if they are also participating in the service as a patient (see definition of a service event).

A group session may be delivered by more than one provider. This may be multidisciplinary care within one clinic appointment as part of a group, e.g. a group session jointly delivered by a physiotherapist and an occupational therapist.

In practice, this should be interpreted to mean that patients are receiving precisely the same services. For example:

- Patients may be part of a movement or hydrotherapy class where all participants are following the same intervention at the same time.
- Patients attending education sessions at chemotherapy or dialysis clinics are group sessions, if two or more people are receiving the same services at the same time.

No - Individual service event

‘No’ indicates that care was delivered to the patient as an individual. An individual service event is provided to one person by one or more healthcare providers. For example:

- Where a clinician works one-on-one with several different patients in the same space over a period of time but each patient is following their own personalised program (for example, where several patients are scheduled to use the physiotherapy gym at once).
- Where multiple persons, such as several family members and carers, meet with a clinician to discuss one patient only.
- Patients attending for treatment at a dialysis or a chemotherapy clinic are receiving individual services.

Group sessions (public psychiatric, alcohol and drug hospital)—emergency and outpatient

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment (public psychiatric or alcohol and drug hospital)—number of group session occasions of service for non-admitted patients (emergency and outpatient), total N[NNNNNN]

Synonymous names: Type of non-admitted patient care (public psychiatric, alcohol & drug) - emergency and outpatient group sessions

METeOR identifier: 270217

Registration status: Health, Standard 01/03/2005

Definition: The total number of occasions of examination, consultation, treatment or other services provided as group sessions to non-admitted patients in the emergency and outpatient functional unit of a public psychiatric hospital or an alcohol and drug hospital.

Data Element Concept: Establishment—number of group session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNNNN]

Maximum character length: 7

Unit of measure: Occasion of service

Data element attributes

Collection and usage attributes

Guide for use: Emergency patients and outpatients are persons who receive non-admitted care. Group session non-admitted care is care provided to persons who receive direct care within the **emergency department** or other designated clinics within the hospital and who are not formally admitted at the time when the care is provided. A person who first contacts the hospital and receives non-admitted care, for example through the emergency department, and is subsequently admitted should have both components of care enumerated separately.

Data element attributes

Collection and usage attributes

Guide for use: Each group is to be counted once, irrespective of size or the number of staff providing services.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

Comments:

This metadata item is derived from metadata items that are not currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Registration status:	Health, Standard 01/03/2005
Definition:	The total number of occasions of examination, consultation, treatment or other services provided as group sessions to non-admitted patients in allied health services functional units or clinics of an establishment.
Data Element Concept:	Establishment—number of group session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NNNNN]
Maximum character length:	6
Unit of measure:	Group session

Data element attributes

Collection and usage attributes

Guide for use:

Allied health services include units primarily concerned with physiotherapy, family planning, dietary advice, optometry, occupational therapy, and so on.

Each group is to be counted once, irrespective of size or the number of staff providing services.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are

provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

Collection methods:

At present, occasions of service to groups are counted in an inconsistent manner. The numbers of occasions of service should be collected for both individual and group sessions for public psychiatric hospitals and alcohol and drug hospitals.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients. This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary.

For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

This metadata item is derived from metadata items that are not currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Data type:	Number
Format:	N[NNNNN]
Maximum character length:	6
Unit of measure:	Group session

Data element attributes

Collection and usage attributes

Guide for use:

Each group is to be counted once, irrespective of size or the number of staff providing services.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

Collection methods:

At present, occasions of service to groups are counted in an inconsistent manner. The numbers of occasions of service should be collected for both individual and group sessions for public psychiatric hospitals and alcohol and drug hospitals.

Comments:

This metadata item is derived from metadata items that are not currently specified in METeOR, but which are recorded in various ways by hospitals/outpatient departments. Examples include identifiers of individual consultations/visits, and diagnostic tests.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

Collection and usage attributes

Guide for use: **Main Health Care Service organisation**

CODE 101 Hospital – public

An organisation comprised of a health care facility or group of health care facilities established under Commonwealth, state or territory legislation as a hospital or free-standing day hospital facility and authorised to provide treatment and/or care to patients. Comprises all health care facilities that are reported as public hospitals to the Public Hospital Establishments National Minimum Data Set (PHE NMDS). This includes organisations such as rehabilitation hospitals; psychiatric hospitals; mothercraft hospitals; and hospices and multi-purpose services defined as hospitals. The list of public hospitals reported to the PHE NMDS is available at www.aihw.gov.au/publications/index.cfm in the Australian Hospital Statistics annual report.

NOTE 1: Excludes providers of services where those services are not captured in the hospital financial statements. For example, the provider of a pathology or pharmacy service may be co-located within the hospital, but as a private service, and will pay the hospital for use of the site. The provider of this pathology or pharmacy service would be recorded under codes 106 to 112.

CODE 102 Hospital – private (excluding private free-standing day hospital facilities)

An organisation comprised of a health care facility or a group of health care facilities established under Commonwealth, state or territory legislation as a hospital and authorised to provide treatment and/or care to patients.

Comprises hospitals that are NOT reporting to the PHE NMDS.

NOTE: State and territory data providers are to refer to the GHE NMDS Collection Guidelines for instructions on how to report expenditure for this category.

Excludes private free-standing day hospital facilities reported under code 103.

CODE 103 Hospital - private free-standing day facility (excluding private non free-standing day hospital facilities)

An organisation comprised of one or more private free-standing day hospital facilities which provide investigation and treatment for acute conditions on a day-only basis and is approved by the Commonwealth as a hospital for the purposes of private health insurance benefits. The four main types of private free-standing day hospitals are specialist endoscopy, ophthalmic, plastic/cosmetic and general. Excludes private non free-standing day hospital facilities reported under code 102.

CODE 104 Residential facility – mental health care

An organisation comprised of one or more specialised mental health facilities primarily engaged in providing residential care to persons requiring mental health diagnosis and treatment combined with either nursing, supervisory or other types of care as required (including medical) by the residents.

Excludes residential care facilities primarily providing aged care or care for persons requiring treatment for alcohol or other substance abuse or persons with a disability.

CODE 105 Residential facility – other

Includes all government-funded facilities primarily engaged in providing residential care to persons requiring diagnosis and treatment for alcohol and other substance abuse combined with either nursing, supervisory or other types of care as required (including medical) by the residents. Includes hospices that are not defined as hospitals and respite and transitional care services.

Excludes facilities primarily providing services to aged persons or persons requiring mental health diagnosis and treatment.

Also excludes residential care facilities that report under the Commonwealth, State and Territory Disability Agreement where the primary purpose is care for persons with a disability.

CODE 106 Provider of ambulance service

Organisations primarily engaged in providing transportation of patients by ground or air, along with health (or medical) care. These services are often provided during a medical emergency but are not restricted to emergencies. The vehicles are equipped with lifesaving equipment operated by medically trained personnel. Includes organisations providing public ambulance services or flying doctor services such as Royal Flying Doctor Service and Care Flight, and support programs to assist isolated patients with travel to obtain specialised health care.

NOTE 2: Excludes providers of services where those services are captured in public or private hospital financial statements. For example, the provider of an ambulance, medical or diagnostic laboratory, general practice, specialist medical, dental or other health practitioner service may be located within a hospital set of accounts and its expenditure recorded on the hospital financial statement. The provider of the ambulance or other service would then be recorded under code 101.

CODE 107 Medical and diagnostic laboratory

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in providing analytic or diagnostic services, including body fluid analysis and diagnostic imaging, generally to the medical profession or the patient on referral from a health practitioner. Includes diagnostic imaging centres; dental or medical X-ray laboratories ultrasound services; medical testing laboratories; medical pathology laboratories; medical forensic laboratories; and X-ray clinic services. Includes public and private medical and diagnostic laboratories.

See NOTE 2 under code 106.

CODE 108 Clinical practices – medical – general

Organisations of registered medical practitioners holding the degree of a Doctor of medicine or a qualification at a corresponding level primarily engaged in the independent practice of general medicine. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or medical centres.

See NOTE 2 under code 106.

This item is not currently required to be reported by state and territory health authorities.

CODE 109 Clinical practices – medical – specialist

This item is not currently required to be reported by state and territory health authorities.

Organisations of health practitioners holding the degree of a Doctor of medicine or a qualification at a corresponding level primarily engaged in the independent practice of specialist medicine or surgery, other than pathology and diagnostic imaging services. These practitioners operate a wide range of specialities in private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or health maintenance type medical centres. Includes for example:

- Anaesthetist service
- Dermatology service
- Ear, nose and throat specialist service
- Gynaecology service
- Neurology service
- Obstetrics service
- Paediatric service

- Psychiatry service
- Specialist medical clinic service
- Specialist surgical service
  See NOTE 2 under code 106.

CODE 110 Clinical practices – medical – other

This item is not currently required to be reported by state and territory health authorities.

Includes organisations of physicians not able to be allocated to Codes 108 or 109

CODE 111 Clinical practices – dental

Organisations of registered health practitioners holding the degree of Doctor of dental medicine or a qualification at a corresponding level primarily engaged in the independent practice of general or specialised dentistry or dental surgery. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals, medical centres or community health facilities. They can provide either comprehensive preventive, cosmetic, or emergency care, or specialise in a single field of dentistry. Also included are dental hospitals providing ambulatory services only. Includes for example:

- Cleft lip and palate services
- Community dental service
- Dental assessment and treatment
- Dental hospital (out-patient)
- Dental practice service
- Dental practitioner service
- Dental surgery service
- Endodontic service
- Oral and maxillofacial services
- Oral pathology service
- Oral surgery service
- Orthodontic service
- Pedodontic service
- Periodontic service

See NOTE 2 under code 106.

CODE 112 Clinical practices – other

This item is not currently required to be reported by state and territory health authorities.

Organisations of independent health practitioners (other than physicians and dentists), such as chiropractors, optometrists, mental health specialists, physical, occupational, and speech therapists and audiologists organisations primarily engaged in providing **ambulatory** health care. These practitioners operate private or group practices in their own offices (e.g., centres, clinics) or in the facilities of others, such as hospitals or medical centres. Includes for example:

- Acupuncture service
- Aromatherapy service
- Audiology service
- Chiropractic service
- Clinical psychology service
- Dental hygiene service
- Dietician service
- Hearing aid dispensing
- Homoeopathic service
- Midwifery service
- Naturopathic service
- Nursing service
- Occupational therapy service
- Optometrist
- Osteopathic service
- Podiatry service
- Speech pathology service
- Therapeutic massage service

See NOTE 2 under code 106.

CODE 113 Community health facility – substance abuse

Organisations with health staff primarily engaged in providing ambulatory services related to the diagnosis and treatment of alcohol and other substance abuse. These are community-based organisations that treat patients who do not require admitted patient treatment. They may provide counselling staff and information regarding a wide range of substance abuse issues and/or refer patients to more extensive treatment programmes, if necessary. Includes for example:

- Community based alcoholism treatment centres and clinics (other than hospitals or residential care facilities);
- Community based detoxification centre and clinics (other than hospitals or residential care facilities);
- Community based drug addiction treatment centres and clinics (other than hospitals or residential care

facilities);

- Community based substance abuse treatment centres and clinics (other than hospitals or residential care facilities).

CODE 114 Community health facility – mental

An organisation comprised of one or more specialised mental health services or facilities with health staff primarily engaged in providing ambulatory services related to the diagnosis and treatment of mental health disorders. These specialised mental health services generally treat patients who do not require admitted patient treatment. However, these services do include consultation/liaison services provided to admitted patients by community mental health services. They may provide counselling staff and information regarding a wide range of mental health issues and/or refer patients to more extensive treatment programmes, if necessary. They may also provide treatment both on and off site, for example through mobile units. Includes only government-funded specialised mental health services, such as community mental health centres and clinics.

Includes expenditure on government-managed community specialised mental health services, plus the cost of the grants to non-government organisations that provide community specialised mental health services, not the total expenditure by these non-government organisations.

Excludes mental health clinics in hospitals and residential mental health care facilities.

CODE 115 Community health facility – other

Organisations with health staff primarily engaged in providing general or specialised ambulatory care. Centres or clinics of health practitioners with the same degree or with different degrees from more than one speciality practising within the same establishment i.e., physician and dentist) are included in this item. Includes only government-funded community health facilities such as:

- Community centres and clinics;
- General practitioner plus centres;
- Multi-speciality community clinics.

Excludes clinical practices that provide exclusively medical services or exclusively health services, ambulatory mental health and substance abuse centres, and free-standing ambulatory surgical centres (reported under codes 108 to 114) and kidney dialysis centres and clinics (reported under codes 101 to 103 if part of a hospital or code 109 if they are free-standing ambulatory centres).

CODE 116 Blood and organ bank

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in collecting, storing and distributing blood and blood products and storing and distributing body organs.

CODE 117 Retail sale/supplier of medical goods – optical glasses and other vision products

This item is not currently required to be reported by state and territory health authorities.
Organisations primarily engaged in the retail sale of optical glasses and other vision products to the general public for personal or household consumption or utilisation. This includes the fitting and repair provided in combination with sales of optical glasses and other vision products.

Excludes organisations primarily engaged in providing optometric services.

CODE 118 Retail sale/supplier of medical goods – hearing aids

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the sale of hearing aids to the general public for personal or household consumption or utilisation. This includes the fitting and repair provided in combination with the sale of hearing aids.

Excludes organisations primarily engaged in hearing testing where that also includes a component of hearing aid dispensing and fitting.

CODE 119 Retail sale/supplier of medical goods – dispensing community pharmacist

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the retail sale of pharmaceuticals to the general public for personal or household consumption or utilisation. Instances when the processing of medicine may be involved should be only incidental to selling. This includes both medicines with and without prescription.

Excludes organisations listed under code 201.

CODE 120 Retail sale/supplier of medical goods – other

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in the sale of medical appliances other than optical goods and hearing aids to the general public with or without prescription for personal or household consumption or utilisation. Included are:

- Organisations primarily engaged in the manufacture of medical appliances but where the fitting and repair is usually done in combination with manufacture of medical appliances.
- Organisations engaged in the retail sale of other miscellaneous medical goods to the general public for personal or household consumption or utilisation (included are sales other than by shops, such as electronic shopping and mail-order houses).
Illustrative examples
- sale of fluids (e.g. for home dialysis);
- all other miscellaneous health and personal care stores;
- all other sale of pharmaceuticals and medical goods;
- electronic shopping and mail-order houses specialised in medical goods.

CODE 121 Provision and administration of public health program

Organisations engaged in government or private administration and provision of public health programs such as health promotion, organised screening, immunisation and health protection programs.

CODE 122 General health administration

Organisations primarily engaged in the regulation of activities of agencies that provide health care, overall administration of health policy, and health insurance. This item comprises government administration (excluding social security) primarily engaged in the formulation and administration of government policy in health and in the setting and enforcement of standards for medical and paramedical personnel and for hospitals, clinics, etc., including the regulation and licensing of providers of health services. For example:

- Department of Health;
- Agencies for the regulation of safety in the workplace.

Excludes organisations primarily engaged in the provision and administration of public health programs which is reported under code 121.

CODE 123 Private health insurance provider

This item is not currently required to be reported by state and territory health authorities.

- Organisations engaged in insurance of health (other than social security funds and other social insurance funds) that provide insurance cover for hospital, medical, dental, pharmaceutical or funeral expenses. This includes organisations primarily engaged in activities involved in or closely related to the management of private health insurance (activities of insurance agents, average and loss adjusters and actuaries.

CODE 188 Main Health Care Service organisation - other

Organisations mainly engaged in providing health care services that are not reported under codes 101 to 123. Includes health or health-related call centres or e-health sites such as Poisons Information Centre and centres that provide information on alcohol and other drugs, mental health or other health issues.

CODE 198 Regional health service (not further defined)

Organisations at an area health service or regional level could be a combination of categories 101 to 188 but which could not be further disaggregated.

CODE 199 State/territory health authority (not further defined)

Organisations at the state or territory health authority level that could be a combination of categories 101 to 188 but which could not be further disaggregated.

Secondary/non-Health Care Service organisation

This item is not currently required to be reported by state and territory health authorities.

CODE 201 Pharmaceutical industry

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in wholesaling human pharmaceuticals, medicines, cosmetics, perfumes and toiletries. Also included are units mainly engaged in wholesaling veterinary drugs or medicines

Excludes organisations listed under code 119.
CODE 202 University

This item is not currently required to be reported by state and territory health authorities.

Organisations primarily engaged in providing undergraduate or postgraduate teaching but which also undertake health research activities. Also includes organisations primarily engaged in undertaking research in the agricultural, biological, physical or social sciences. Units may undertake the research for themselves or others.

Includes:

- Postgraduate school, university operation
- Research school, university operation
- Specialist institute or college
- Undergraduate school, university operation
- University operation

For reporting purposes includes only the health or health related research component or other health services component of these organisations' activities.

CODE 203 Non-health related insurance

This item is not currently required to be reported by state and territory health authorities.

Units mainly engaged in providing general insurance cover (except life and health insurance).

Includes:

- Motor vehicle third party insurance provision
- Worker's compensation insurance provision

CODE 204 Residential aged care facility

This item is not currently required to be reported by state and territory health authorities.

An organisation comprised of one or more government-funded facilities primarily engaged in providing residential care to aged persons and in receipt of funding under the Aged Care Act and subject to Commonwealth reporting requirements (i.e. report to the System for the payment of Aged Residential Care (SPARC) collection.

Excludes facilities primarily providing services to persons requiring mental health diagnosis and treatment. Also excludes residential care facilities that report under the Commonwealth, State and Territory Disability Agreement where the primary purpose is care for persons with a disability.

CODE 288 Secondary/non-Health Care Service organisation – other

This item is not currently required to be reported by state and territory health authorities.

This item comprises organisations that are not reported under codes 201 to 203 which provide health care as secondary providers or other providers. Included are providers of occupational health care and home care provided by private households.

Includes:

Occupational health care services not provided in separate health care organisations (all industries);

- Military health services not provided in separate health care organisations
- Prison health services not provided in separate health care organisations
- School health services
- Other providers n.e.c.

Other providers of services which support the health care industry such as laundry or catering services.

Other providers of services unrelated to the health care industry such as the building or automotive industry.

Health professionals attended (diabetes mellitus)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—health professionals attended for diabetes mellitus (last 12 months), code N

METeOR identifier: 270287

Registration status: Health, Standard 01/03/2005

Definition: The health professionals that a person has attended in the last 12 months in relation to issues arising from diabetes mellitus, as represented by a code.

Data Element Concept: Person—health professionals attended for diabetes mellitus

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:	Value	Meaning
	1	Diabetes educator
	2	Dietician
	3	Ophthalmologist
	4	Optometrist
	5	Podiatrist
	8	None of the above
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: Record a code sequentially for each health professional attended.

A person may have attended several health professionals in the last 12 months; therefore more than one code can be recorded sequentially.

Example 1: If a person has attended a diabetes educator and a podiatrist in the last twelve months, the code recorded would be 15.

Example 2: If all have been seen, the code recorded would be 12345.
If the person answers 'NO' to all the health professionals specified, code 8 should be applied.

CODE 9 should only be used in situations where it is not practicable to ask the questions.

Collection methods: The person should be asked about each type of health professional in successive questions, as follows:

Have you attended any of the following health professionals in relation to diabetes mellitus in the last 12 months?

Diabetes educator ___Yes ___ No

Dietician ___Yes ___ No

Ophthalmologist ___Yes ___ No

Optometrist ___Yes ___ No

Podiatrist ___Yes ___ No

The appropriate code should be recorded for each health professional attended.

Comments: The health professional occupations are assigned the following codes at the occupation level of the Australian Standard Classification of Occupations, Second Edition, Australian Bureau of Statistics, 1997, Catalogue No. 1220.0

Diabetes educator 2512-13

Dietician 2393-11

Ophthalmologist 2312-19

Optometrist 2384-11

Podiatrist 2388-11

6	Private residential aged care service
7	Private medical practitioner rooms or surgery
8	Other public health service provider setting
9	Other private health service provider setting
12	Patient's home
88	Other (including 'Medihotels')

Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

A health service provider setting is classified as 'public' if it is operated by or on behalf of a Commonwealth, state or territory or local government agency.

CODES 1 and 2 Hospital or day surgery centre

A 'hospital or day surgery centre' is an establishment that provides at least minimal medical, surgical or obstetric services and/or care, and provides comprehensive qualified nursing services as well as other necessary professional services. The centre must be licensed by a state, territory or Commonwealth health department, or controlled by a government department. These codes include psychiatric hospitals; hospitals that specialise in dental, ophthalmic aids, and other specialised medical or surgical care; and free-standing day surgery centres.

CODES 3 and 4 Community health centre

A 'community health centre' is an establishment that provides a range of non-residential health services, or which provides for the coordination of health services elsewhere in the community.

CODES 5 and 6 Residential aged care service

A 'residential aged care service' is an establishment that provides long-term residential care, involving regular basic nursing care, primarily to older people who are frail or have disabilities. The service must be approved by the Australian Government Department of Health and Ageing and/or licensed by the state, or controlled by a government department.

CODE 7 Private medical practitioner rooms or surgery

'Private medical practitioner rooms or surgery' provide investigation and treatment for acute conditions on a non-residential, day-only basis. This code includes 24-hour medical clinics and general practitioner surgeries.

CODES 8 and 9 Other health service provider setting

'Other health service provider setting' includes hospices, and alcohol and drug treatment centres.

CODE 12 Patient's home

'Patient's home' includes domiciliary nursing services.

CODE 88 Other (including 'Medihotels')

'Other (including 'Medihotels')' covers services in settings other than those listed above. ‘Medihotels’ provide supported accommodation to patients who require access to hospital services.

CODE 99 Not stated/inadequately described

‘Not stated/inadequately described’ should be used only when the information is not currently available, but is expected to become available.

Comments: This value domain maps to the Insurance Statistics Australia data item 14.3 ‘Venue where procedure performed’ (AIHW 2011).

Data element attributes

Collection and usage attributes

Guide for use: Where the health-care incident that gave rise to the medical indemnity claim involved a series of events that occurred in different health service settings, the code recorded should reflect the health service setting in which the primary incident occurred. Where a missed diagnosis was the main, dominant or primary cause giving rise to a medical indemnity claim, the code recorded should reflect the health service setting where the diagnosis should first have been made, but was not.

Format: NN[N].N

Maximum character length: 4

Supplementary values:

Value	Meaning
999.9	Not measured

Unit of measure: Centimetre (cm)

Data element attributes

Collection and usage attributes

Guide for use: In order to ensure consistency in measurement, the measurement protocol described under Collection methods should be used.

Measurements of height should be assessed in relation to children and adolescents' age and pubertal status.

Collection methods: The measurement protocol described below are those recommended by the *International Society for the Advancement of Kinanthropometry as described by Norton et al. (1996), and the World Health Organization (WHO Expert Committee 1995), which was adapted from Lohman et al. (1988).*

Measurement protocol:

Height measurements can be based on recumbent length or standing height. In general, length measurements are recommended for children under 2 years of age and height measurements for others.

The measurement of height requires a vertical metric rule, a horizontal headboard, and a non-compressible flat even surface on which the subject stands. The equipment may be fixed or portable, and should be described and reported.

The graduations on the metric rule should be at 0.1 cm intervals, and the metric rule should have the capacity to measure up to at least 210 cm.

Measurement intervals and labels should be clearly readable under all conditions of use of the instrument.

Apparatus that allows height to be measured while the subject stands on a platform scale is not recommended.

Adults and children who can stand:

The subject should be measured without shoes (i.e. is barefoot or wears thin socks) and wears little clothing so that the positioning of the body can be seen. Anything that may affect or interfere with the measurement should be noted on the data collection form (e.g. hairstyles and accessories, or physical problems). The subject stands with weight distributed evenly on both feet, heels together, and the head positioned so that the line of vision is at right angles to the body. The correct position for the head is in the Frankfort horizontal plan (Norton et al. 1996). The arms hang freely by the sides. The head, back, buttocks and heels are positioned vertically so that the buttocks and the heels are in contact with the vertical board. To obtain a consistent measure, the subject is asked to inhale deeply and stretch to their fullest height. The measurer applies gentle upward pressure through the mastoid processes to maintain a fully erect position when the measurement is taken. Ensure that the head remains positioned so that the line of vision is at right angles to the body, and the heels remain in contact with the base board.

The movable headboard is brought onto the top of the head with sufficient pressure to compress the hair.

The measurement is recorded to the nearest 0.1 cm. Take a repeat measurement. If the two measurements disagree by more than 0.5 cm, then take a third measurement. All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject’s measured height is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 cm. If so, rounding should be to the nearest even digit to reduce systematic over reporting (Armitage & Berry 1994). For example, a mean value of 172.25 cm would be rounded to 172.2 cm, while a mean value of 172.35 cm would be rounded to 172.4 cm.

Infants:

For the measurement of supine length of children up to and including 2 years of age, two observers are required. One observer positions the head correctly while the other ensures the remaining position is correct and brings the measuring board in contact with the feet. The subject lies in a supine position on a recumbent length table or measuring board. The crown of the head must touch the stationary, vertical headboard. The subject's head is held with the line of vision aligned perpendicular to the plane of the measuring surface. The shoulders and buttocks must be flat against the table top, with the shoulders and hips aligned at right angles to the long axis of the body. The legs must be extended at the hips and knees and lie flat against the table top and the arms rest against the sides of the trunk. The measurer must ensure that the legs remain flat on the table and must shift the movable board against the heels. In infants care has to be taken to extend the legs gently. In some older children two observers may also be required.

In general, length or height is measured and reported to the nearest 0.1 cm. For any child, the length measurement is approximately 0.5 - 1.5 cm greater than the height measurement. It is therefore recommended that when a length measurement is applied to a height-based reference for children over 24 months of age (or over 85 cm if age is not known), 1.0 cm be subtracted before the length measurement is compared with the reference. It is also recommended that as a matter of procedure and data recording accuracy, the date be recorded when the change is made from supine to standing height measure.

Validation and quality control measures:

All equipment, whether fixed or portable should be checked prior to each measurement session to ensure that both the headboard and floor (or footboard) are at 90 degrees to the vertical rule. With some types of portable anthropometer it is necessary to check the correct alignment of the headboard, during each measurement, by means of a spirit level. Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within-) or different (between-) observers repeating the measurement of height, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement (Pederson & Gore 1996)) between observers should not exceed 5 mm and be less than 5 mm within observers.

Extreme values at the lower and upper end of the distribution of measured height should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference. Last digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

Comments:

This metadata item applies to persons of all ages. It is recommended for use in population surveys and health care settings.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present height data in categories. It is recommended that 5 cm groupings are used for this purpose. Height data should not be rounded before categorisation. The following categories may be appropriate for describing the heights of Australian men, women, children and adolescents although the range will depend on the population:

Height

70 cm = Height

75 cm = Height

... in 5 cm categories

185 cm = Height

Height => 190 cm

Unit of measure: Centimetre (cm)

Data element attributes

Collection and usage attributes

Collection methods: The method of data collection, e.g. face to face interview, telephone interview or self-completion questionnaire, can affect survey estimates and should be reported.

The data collection form should include a question asking the respondent what their height is. For example, the Australian Bureau of Statistics National Health Survey 1995 included the question 'How tall are you without shoes?'. The data collection form should allow for both metric (to the nearest 1 cm) and imperial (to the nearest 0.5 inch) units to be recorded.

If practical, it is preferable to enter the raw data into the database before conversion of measures in imperial units to metric. However if this is not possible, height reported in imperial units can be converted to metric prior to data entry using a conversion factor of 2.54 cm to the inch.

Rounding to the nearest 1 cm will be required for measures converted to metric prior to data entry, and may be required for data reported in metric units to a greater level of precision than the nearest 1 cm. The following rounding conventions are desirable to reduce systematic over-reporting (Armitage & Berry 1994):

NNN.x where x

NNN.x where x > 5 - round up, e.g. 172.7 cm would be rounded to 173 cm.

NNN.x where x = 5 - round to the nearest even number, e.g. 172.5 cm would be rounded to 172 cm, while 173.5 cm would be rounded to 174 cm.

Comments:

This metadata item is recommended for persons aged 18 years or older. It is recommended for use in population surveys when it is not possible to measure height.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present height data in categories. It is recommended that 5 cm groupings are used for this purpose. Height data should not be rounded before categorisation. The following categories may be appropriate for describing the heights of

Australian men and women, although the range will depend on the population. The World Health Organization's range for height is 140-190 cm.

Height <140 cm

140 cm = Height < 145 cm

145 cm = Height < 150 cm

... in 5 cm categories

185 cm = Height < 190 cm

Height => 190 cm

On average, height tends to be overestimated when self-reported by respondents. Data for Australian men and women aged 20-69 years in 1989 indicated that men overestimated by an average of 1.1 cm (SEM* of 0.04 cm) and women by an average of 0.5 cm (SEM of 0.05 cm) (Waters 1993). The extent of overestimation varied with age.

*Note: SEM is the standard error of measurement.

Format:	N
Maximum character length:	1

Permissible values:	Value	Meaning
	1	Year 12
	2	Year 11
	3	Year 10
	4	Year 9
	5	Year 8 or below
	6	No schooling
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Highest level of schooling includes study at a secondary education level which might, for example, be undertaken at a Technical and Further Education (TAFE) institution (ABS, 2002).

Record the code for the highest year of schooling completed, regardless of the institution or location where that study took place. If a year of schooling had been commenced but not completed, the code for the year below should be used.

Only one option may be selected.

Comments: This metadata item maps to the Australian Bureau of Statistics standard ‘Highest year of school completed’.

Representation class: Total

Data type: Number

Format: NN[N].N

Maximum character length: 4

Supplementary values:

Value	Meaning
999.9	Not measured

Unit of measure: Centimetre (cm)

Data element attributes

Collection and usage attributes

Guide for use: As there are no cut-off points for waist-to-hip ratio for children and adolescents, it is not necessary to collect this metadata item for those aged under 18 years.

Collection methods: The measurement protocol described below is that recommended by the *World Health Organization (WHO Expert Committee 1995).*

Measurement protocol:

The data collection form should allow for up to three measurements of hip circumference to be recorded in centimetres to 1 decimal place. The data collection form should also have the capacity to record any reasons for the non-collection of hip circumference data.

The measurement of hip circumference requires a narrow (

The subject should wear only non-restrictive briefs or underwear, a light smock over underwear or light clothing. Belts and heavy outer clothing should be removed. Hip measurement should be taken over one layer of light clothing only.

The subject stands erect with arms at the sides, feet together and the gluteal muscles relaxed. The measurer sits at the side of the subject so that the level of maximum posterior extension of the buttocks can be seen. An inelastic tape is placed around the buttocks in a horizontal plane. To ensure contiguity of the two parts of the tape from which the circumference is to be determined, the cross-handed technique of measurement, as described by Norton et al. (1996), should be used. Ideally an assistant will check the position of the tape on the opposite side of the subject's body. The tape is in contact with the skin but does not compress the soft tissues. Fatty aprons should be excluded from the hip circumference measurement.

The measurement is recorded to the nearest 0.1 cm. Take a repeat measurement and record it to the nearest 0.1 cm. If the two measurements disagree by more than 1 cm, then take a third measurement.

All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject's measured hip circumference is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 cm. If so, rounding should be to the nearest even digit to reduce systematic over reporting. For example, a mean value of 102.25 cm would be rounded to 102.2 cm, while a mean value of 102.35 cm would be rounded to 102.4 cm.

Validation and quality control measures:

Steel tapes should be checked against a 1-metre engineer's rule every 12 months. If tapes other than steel are used they should be checked daily against a steel rule.

Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within-) or different (between-) observers repeating the measurement, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement (Pederson & Gore 1996)) between observers should not exceed 2% and be less than 1.5% within observers.

Extreme values at the lower and upper end of the distribution of measured hip circumference should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference.

Last digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

Comments:

This metadata item applies to persons aged 18 years or older. It is recommended for use in population surveys and health care settings.

Its main use is to enable the calculation of adult waist-to-hip ratio which requires the measurement of hip circumference and waist circumference.

More recently it has emerged that waist circumference alone, or in combination with other metabolic measures, is a better indicator of risk and reduces the errors in waist-to-hip ratio measurements.

Waist-to-hip ratio is therefore no longer a commonly used measure.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present hip circumference data in categories. It is recommended that 5 cm groupings be used for this purpose. Hip circumference data should not be rounded before categorisation.

Histopathological grade

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—histopathological grade, code N

METeOR identifier: 422555

Registration status: Health, Standard 07/12/2011

Definition: The histopathological grade or differentiation in a person with cancer, as represented by a code.

Data Element Concept: Person with cancer—histopathological grade

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:	Value	Meaning
	1	Grade 1: Low grade; well differentiated, differentiated, NOS
	2	Grade 2: Intermediate grade, moderately differentiated, moderately well differentiated, intermediate differentiation
	3	Grade 3: High grade, poorly differentiated
	4	Grade 4: Undifferentiated, anaplastic
Supplementary values:	9	Grade or differentiation not determined, not stated or not applicable

Data element attributes

Collection and usage attributes

Guide for use: Histopathological grade or differentiation describes how little the tumour resembles the normal tissue from which it arose.

Only malignant tumours are graded and only one code can be recorded.

When more than one grade is documented for the primary tumour within the same specimen report, use the highest grade. For example, if grade 2-3 is documented, record the grade as 3.

If the grades differ on multiple pathology reports for the same tumour, use the value from the larger specimen (for example, the grade from a surgical excision specimen would be used over the grade from a specimen from a diagnostic biopsy).

Breast cancer coding rules:

Use the Nottingham grade (Elston-Ellis modification of Bloom-Richardson grading system). This classification only uses grades 1-3, 9.

For an invasive tumour with an in situ component, record the grade for the invasive component only. If the grade of the invasive component is not reported, record the grade as unknown.

Collection methods:

Cancer registry use:

Collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease.

Only malignant tumours are graded.

Cancer (clinical) DSS Health, Standard 07/12/2011

Specifications:

Hormone therapy completion date

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—hormone therapy completion date, DDMMYYYY
METeOR identifier:	393568
Registration status:	Health, Standard 07/12/2011
Definition:	The completion date of the **hormone therapy** administered during the initial course of treatment for cancer, expressed as DDMMYYYY.
Data Element Concept:	Cancer treatment—hormone therapy completion date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

Hormone therapy is cancer treatment that achieves its antitumour effect through changes in hormonal balance. This includes the administration of hormones, agents acting via hormonal mechanisms, antihormones and steroids.

The completion date of hormone treatment is the date of the last dose administered during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The completion date of hormone therapy is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of immunotherapy.

Do not record the dates for prednisone as hormone therapy when it is administered for reasons other than chemotherapeutic treatment. Only record prednisone as hormone therapy when it is administered in combination with chemotherapy such as MOPP (mechlorethamine, vincristine, procarbazine, prednisone) or COPP (cyclophosphamide, vincristine, procarbazine, prednisone).

Tumour involvement or cancer treatment may destroy hormone-producing tissue. Hormone replacement therapy will be given if the hormone is necessary to maintain normal metabolism and body function. Do not code hormone replacement therapy as part of the initial course of treatment.

A patient may undergo hormone therapy for an extended period of time.

Multiple entries are not permitted.

Dates of surgery, radiotherapy and other systemic treatments are collected as separate items. However, if a patient receives treatment with a protocol that includes different types of systemic therapy agents, for example, a chemotherapy agent and a hormone therapy agent, record the completion date of treatment in both relevant data items.

Collection methods: The information should be obtained from the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Hospital identifier

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Hospital—hospital identifier, XXXXX
METeOR identifier:	404239
Registration status:	Health, Standard 07/12/2011
Definition:	A unique identifier for a hospital, as represented by a combination of numeric and/or alphabetic characters.
Data Element Concept:	Hospital—hospital identifier

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	String
Format:	XXXXX
Maximum character length:	5

Data element attributes

Collection and usage attributes

Guide for use:

The complete identifier string, including State/Territory identifier, Region identifier, Organisation identifier and Hospital identifier, should be a unique code for the hospital in that state/territory.

The management of mental health services across a jurisdiction or area may result in a number of separate *Specialised mental health service organisations* reporting various mental health service units from a single hospital entity. In these cases, the Hospital identifier should be identical across all entries for the same hospital, within the same jurisdiction, regardless of the overarching organisational reporting structure.

The Hospital identifier should be identical to the Organisation identifier component, of the *Establishment—organisation identifier (Australian)* reported to the Public Hospital Establishments NMDS.

A *Specialised mental health service organisation* may consist of one or more clusters of service units providing services in admitted patient, residential and ambulatory settings. For example, a *Specialised mental health service organisation* may consist of several hospitals (clusters of admitted patient service units) and/or ambulatory or residential service unit clusters (for example, a cluster of child and adolescent ambulatory service units, and a cluster of aged residential service units).

To allow service units to be individually identified, but still also to be identified as part of a hospital (for the admitted patient service setting), or as part of another type of cluster (e.g. other cluster types for ambulatory or residential service setting), a separate reporting level called *Hospital* for admitted patient service units and *Service unit cluster* for ambulatory service units and residential service units is necessary.

The concept of hospital only applies to admitted service units. The equivalent entity for the grouping of ambulatory and residential service units is cluster.

Where applicable, service unit reporting structures should be identical between all mental health collections (e.g., Mental Health National Minimum Data Sets and the Mental Health National Outcomes and Casemix Collection (NOCC)).

Hospital insurance status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—hospital insurance status, code N
METeOR identifier:	270253
Registration status:	Health, Standard 01/03/2005

Definition:

Hospital insurance as represented by a code under one of the following categories:

- Registered insurance - hospital insurance with a health insurance fund registered under the National Health Act 1953 (Cwlth)
- General insurance - hospital insurance with a general insurance company under a guaranteed renewable policy providing benefits similar to those available under registered insurance
- No hospital insurance or benefits coverage under the above.

Data Element Concept: Patient—hospital insurance status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Hospital insurance
	2	No hospital insurance
Supplementary values:	9	Unknown

Data element attributes

Collection and usage attributes

Guide for use: Persons covered by insurance for benefits of ancillary services only are included in 2 - no hospital insurance.

The ‘unknown’ category should not be used in primary collections but can be used to record unknown insurance status in databases.

This metadata item is to determine whether the patient has hospital insurance, not their method of payment for the episode of care.

Comments:

Insurance status was reviewed and modified to reflect changes to new private health insurance arrangements under the Health Legislation (Private Health Insurance Reform) Amendment Act 1995.

Employee health benefits schemes became illegal with the implementation of Schedule 2 of the private health insurance reforms, effective on 1 October 1995.

Under Schedule 4 of the private health insurance reforms, on 1 July 1997, the definition of the ‘basic private table’ or ‘basic table’, and ‘supplementary hospital table’ and any references to these definitions was omitted from the National Health Act 1953. All hospital tables offered by registered private health insurers since 29 May 1995 have been referred to as ‘Applicable Benefits Arrangements’ and marketed under the insurer’s own product name.

Data element attributes

Collection and usage attributes

Guide for use:

Generally, the complete hospital name should be used to avoid any ambiguity in identification. This should usually be the same as company registration name. However, in certain circumstances (e.g. internal use), a short name (i.e. an abbreviated name by which the hospital is known) or a locally used name (e.g. where a hospital is known by a name that is different to the company registration name) can be used. At least one hospital name must be recorded for each hospital.

The management of mental health services across a jurisdiction or area may result in a number of separate *Specialised mental health service organisations* reporting various mental health service units from a single hospital entity. In these cases, the Hospital name need not be identical across all entries for the same hospital. A *Specialised mental health service organisation* may consist of one or more clusters of service units providing services in admitted patient, residential and ambulatory settings. For example, a *Specialised mental health service organisation* may consist of several hospitals (clusters of admitted patient service units) and/or ambulatory or residential service unit clusters (for example, a cluster of child and adolescent ambulatory service units, and a cluster of aged residential service units).

To allow service units to be individually identified, but still also to be identified as part of a hospital (for the admitted patient service setting), or as part of another type of cluster (e.g. other cluster types for ambulatory or residential service setting), a separate reporting level called *Hospital* for admitted patient service units and *Service unit cluster* for ambulatory service units and residential service units is necessary.

The concept of hospital only applies to admitted service units. The equivalent entity for the grouping of ambulatory service units is cluster.

Where applicable, service unit reporting structures should be identical between all mental health collections (e.g., Mental Health National Minimum Data Sets and the Mental Health National Outcomes and Casemix Collection (NOCC)).

Collection and usage attributes

Guide for use: Total hours expressed as 000, 001 etc.

Data element attributes

Collection and usage attributes

Guide for use: This metadata item relates to each position (job) held by a medical practitioner.

Collection methods: There are inherent problems in asking for information on number of hours on-call not worked per week, for example, reaching a satisfactory definition and communicating this definition to the respondents in a self-administered survey. Whether hours on-call not worked are collected for main job only, or main job and one or more additional jobs, it is important that a total for all jobs is included.

Collection and usage attributes

Guide for use: Total hours expressed as 000, 001 etc.

Data element attributes

Collection and usage attributes

Guide for use:

Total hours worked are for both employed and self-employed health professionals.

Total hours worked in clinical role:

- includes travel to home visits or calls out;
- excludes other time travelling between work locations; and
- excludes unpaid professional and/or voluntary activities.

Registered health professionals on leave at the time of registration are asked to report their usual hours worked.

Collection methods:

Total hours worked refers to hours worked in the week before registration.

Guide for use: Total hours worked are for both employed and self-employed health professionals.

Total hours worked in public sector:

- includes travel to home visits or calls out;
- excludes other time travelling between work locations;

and

- excludes unpaid professional and/or voluntary activities.

Registered health professionals on leave at the time of registration are asked to report their usual hours worked.

Public sector employment is employment with an establishment run by the government sector. A public sector establishment:

- operates from the public accounts of a Commonwealth, state or territory government or is part of the executive, judicial or legislative arms of government,
- is part of the general government sector or is controlled by some part of the general government sector,
- provides government services free of charge or at nominal prices, and
- is financed mainly from taxation.

Collection methods: Total hours worked refers to hours worked in the week before registration.

Household annual gross income range

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Household—gross income (annual), dollar range code N

METeOR identifier: 290737

Registration status: Health, Standard 04/05/2005

Definition: The value of gross annual income from all sources (before deductions for income tax, superannuation, etc.) for all household members as represented by a dollar range code.

Context: Gross household income ranges are used as an indicator of the economic status of the household.

Data Element Concept: Household—gross income

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning

	1	Less than $ 20,000
	2	$ 20,001-$ 30,000
	3	$ 30,001-$ 50,000
	4	$ 50,001 - $ 100,000
	5	More than $ 100,000
Supplementary values:	6	Don't know/not sure
	7	Not stated

Data element attributes

Collection and usage attributes

Guide for use:

The main components of gross income are:

- current usual wages and salary;
- income derived from self-employment;
- government pensions, benefits and allowances; and
- other income comprising investments (including interest, dividends, royalties and rent) and other regular income (including superannuation, private scholarships received in cash, workers' compensation, accident compensation, maintenance or alimony, and any other allowances regularly received).

Gross income is regarded as all receipts which are received regularly and are of a recurring nature. Certain receipts such as lump sum receipts, windfall gains and withdrawals from savings are not considered to conform to these criteria and are not included as income.

Please note that this data element is not consistent with the ABS standards for cash income.

HPI-O

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Healthcare provider—organisation identifier, N(16)

METeOR identifier: 426830

Registration status: Health, Standard 03/12/2011

Definition: The Healthcare provider identifier—organisation (HPI-O) is the numerical identifier that uniquely identifies organisations in Australia where healthcare is provided.

Data Element Concept: Healthcare provider—organisation identifier

Value domain attributes

Representational attributes

Representation class: Identifier

Data type: Number

Format: N(16)

Maximum character length: 16

Source and reference attributes

Submitting organisation: Cancer Australia

Reference documents: National E-Health Transition Authority 2010. HI service: concept of operations. Version 2.0-final release. Sydney: National E-Health Transition Authority

Data element attributes

Collection and usage attributes

Guide for use: A Healthcare Provider Identifier-Organisation (HPI-O) identifies organisations where healthcare services are provided. For example, state health departments, hospitals, medical practices, pathology or radiology laboratories or pharmacies.

Each organisation’s HPI-O is unique within the Australian healthcare system.

The HPI-O is part of the government’s e-health initiative developed to enhance the way information is exchanged, shared and managed in the Australian health sector. Electronic identifiers and the systems underpinning them were developed and are maintained by Medicare Australia.

All organisations that provide healthcare services will be able to apply for a HPI-O. As part of establishing their eligibility, an organisation will need to provide evidence to the HI Service Operator that it is a legal entity and employs or contracts one or more individual healthcare providers or sole traders who are employed for the purpose of providing a health service. Registration is optional though desirable and the information guides and forms are available online at Medicare.

Organisations registered directly with the HI Service are referred to as "seed" organisations. Once registered, they can obtain identifiers for subordinate organisations or departments known as "network" organisations. For example, the seed organisation The North Shore Hospital may declare their radiology department as a network organisation so it will have its own unique identifier.

Record the full Healthcare Provider Identifier-Organisation (HPI-O) for an organisation.

All healthcare identifiers use the International Standard ISO 7812-1:2006 that specifies the numbering system for identification cards.

The format of the number is as follows:

- Digits N1-N6 consist of the issuer identification number
- N1-N2 Major industry identifier: 80 = health
- N3-N5 Country code: 036 = Australia
- N6 Number type: 2 = HPI-O
- Digits N7-N15 Individual account identification (9 digits for the unique identifier)
- Digit N16 Check digit

Comments: The Healthcare Provider Identifier-Organisation is part of the government’s e-health initiative and supports healthcare providers in their decision making by improving the quality and accessibility of patient information, facilitates communication between clinicians and patients, and advances policy development and healthcare planning by assisting in the collection of national, high quality health information.

Human epidermal growth factor receptor-2 test result

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—human epidermal growth factor receptor-2 test result, code N
Synonymous names:	HER2 test result
METeOR identifier:	370572
Registration status:	Health, Standard 06/03/2009
Definition:	The result of a person's human epidermal growth factor receptor-2 (HER2) test, as represented by a code.
Data Element Concept:	Person with cancer—human epidermal growth factor receptor-2 test result

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:	Value	Meaning
	1	Positive
	2	Negative
	3	Equivocal
Supplementary values:	7	Unknown (test results not available)
	8	Not applicable (test not done)

Collection and usage attributes

Guide for use:

Record the reported conclusion of the HER2.

If no conclusion is reported use the following guidelines (from the National Breast and Ovarian Cancer Centre and Australian Cancer Network's pathology reporting guide (3rd ed.) for breast cancer):

CODE 1 Positive

- **For in situ hybridisation:**
  Result is more than 6 copies of the HER2 gene per nucleus OR a ratio of HER2 gene signals to chromosome 17 signals of more than 2.2.
- **For Immunochemistry:**
  Result is described as 3+ or +++ OR >30% of cancer cells show strong complete membrane staining without cytoplasmic staining and without staining of normal tissue.

CODE 2 Negative

- **For in situ hybridisation:**
  Result is less than 4 copies of the HER2 gene per nucleus OR a ratio of HER2 gene signals to chromosome 17 signals of less than 1.8.
- **For Immunochemistry:**
  Result described as 0, 1+ or + OR <10% of cancer cells show staining.

CODE 3 Equivocal

- **For in situ hybridisation:**
  Result is an average of between 4 and 6 HER2 gene copies per nucleus with a single probe OR a ratio of HER2 gene signals to chromosome 17 signals in the range of 1.8-2.2.
- **For Immunochemistry:**
  Result described as 2+ or ++ OR <10% of cancer cells show strong complete membrane staining (rare) OR 10-30% of cancer cells show weak to moderate complete membrane staining OR Strong cytoplasmic staining is present, making assessment of membrane staining difficult.

Supplementary codes

CODE 7 Unknown (test results not available)

Use this code when the test has been performed but the results are not yet available for analysis.

CODE 8 Not applicable (test not done)

This code is used as a validation measure, to show that the reason for the lack of results is due to the test not being performed.

Data element attributes

Collection and usage attributes

Collection methods: For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or subsequent metastatic disease.

Where different values are available from multiple specimens, the appropriate values to enter are selected according to the following hierarchy of rules:

When multiple HER2 values are available, the value established by the most accurate test is used as per the hierarchy: FISH > CISH/SISH > IHC. (See Person with cancer—HER2 test type, code N) If the HER2 values differ on multiple pathology reports for the same tumour, use the value from the larger specimen.

For multifocal tumours, use the HER2 value from the largest focus or from a metastatic deposit; e.g. Lymph node metastasis. A smaller focus that is HER2 positive may in fact be the source of a metastasis and in this setting the patient would derive benefit from the therapy offered as a result of HER2 positive status.

Comments: Human epidermal growth factor receptor-2 (HER2) promotes the growth of cancer cells. HER2 is also known as c-erB-2 and Her2/neu. Tumours that are HER2-positive tend to grow more quickly than other types of cancer. HER2 status is an important prognostic marker and predicts the response to several therapies.

Human epidermal growth factor receptor-2 test type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—human epidermal growth factor receptor-2 test type, code N
Synonymous names:	HER2 test type
METeOR identifier:	370607
Registration status:	Health, Standard 06/03/2009
Definition:	The type of test used to determine the results of human epidermal growth factor receptor-2 (HER2) at the time of diagnosis of the primary tumour, as represented by a code.
Data Element Concept:	Person with cancer—human epidermal growth factor receptor-2 test type

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Fluorescence in situ hybridisation (FISH)
	2	Brightfield in situ hybridisation
	3	Immunochemistry (IHC)
	8	Other
Supplementary values:	9	Test type not stated or unknown

Collection and usage attributes

Guide for use: CODE 2 Brightfield in situ hybridisation

Includes Chromogenic in situ hybridisation (CISH) and Silver in situ hybridisation (SISH).

Data element attributes

Collection and usage attributes

Guide for use: Record the test type corresponding to the test result recorded in 'Person with Cancer - human epidermal growth factor receptor-2 test result'.

Comments: Immunochemistry (IHC) measures how much HER2 protein is present in the tumour sample. Fluorescence in situ hybridisation (FISH), chromogenic in situ hybridisation (CISH) and silver in situ hybridisation (SISH) measure the amount of amplification of the gene responsible for HER2. The type of HER2 test used to determine HER2 status affects the accuracy of the information.

Hypertension—treatment

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—hypertension treatment with antihypertensive medication indicator (current), code N

METeOR identifier: 302442

Registration status: Health, Standard 21/09/2005

Definition: Whether a person is currently being treated for hypertension (high blood pressure) using antihypertensive medication, as represented by a code.

Data Element Concept: Person—hypertension treatment with antihypertensive medication indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes

Record if a person is currently being treated for hypertension using antihypertensive medication.

CODE 2 No

Record if a person is not currently being treated for hypertension using antihypertensive medication.

Collection methods: Ask the individual if he/she is currently treated with anti-hypertensive medications. Alternatively obtain the relevant information from appropriate documentation.

Hypoglycaemia—severe

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—severe hypoglycaemia indicator, code N

METeOR identifier: 302825

Registration status: Health, Standard 21/09/2005

Definition: Whether a person has had **severe hypoglycaemia**, as represented by a code.

Data Element Concept: Person—severe hypoglycaemia indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes: Record if the person has a history of severe hypoglycaemia.

CODE 2 No: Record if the person has no history of severe hypoglycaemia.

Collection methods: Ask the individual if he/she has had a severe hypoglycaemia requiring assistance. Alternatively obtain the relevant information from appropriate documentation.

Comments: The medications used in the treatment of diabetes may cause the blood glucose value to fall below the normal range and this is called hypoglycaemia.

Hysterectomy indicator

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Female—hysterectomy indicator, yes/no code N

METeOR identifier: 457775

Registration status: Health, Standard 07/12/2011

Definition: An indicator of whether a female person has had a hysterectomy performed, as represented by a code.

Data Element Concept: Female—hysterectomy indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Boolean

Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

A female person has had a hysterectomy performed.

CODE 2 No

A female person has not had a hysterectomy performed.

A hysterectomy is the surgical removal of the uterus and, sometimes, the cervix.

Immunotherapy completion date

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—immunotherapy completion date, DDMMYYYY
METeOR identifier:	393591
Registration status:	Health, Standard 07/12/2011
Definition:	The completion date of **immunotherapy** administered during the initial course of treatment for cancer, expressed as DDMMYYYY.
Data Element Concept:	Cancer treatment—immunotherapy completion date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

The completion date of immunotherapy treatment is the date of the last dose administered during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The completion date of immunotherapy treatment is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of the immunotherapy.

A patient may undergo immunotherapy for an extended period of time.

The completion date of the immunotherapy treatment is recorded even if the agent is experimental.

Multiple entries are not permitted.

Dates of surgical, radiotherapy and other systemic treatments are collected as separate items. However, if a patient receives treatment with a protocol that includes different types of systemic therapy agents, for example, a chemotherapy agent and an immunotherapy agent, record the completion date of treatment in both relevant data items.

Collection methods: The information should be obtained from the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Impairment of body function

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—extent of impairment of body function, code (ICF 2001) N

METeOR identifier: 320138

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: A person's degree of impairment in a specified body function, as represented by a code.

Context: Human functioning and disability

Data Element Concept: Person—extent of impairment of body function

Value domain attributes

Representational attributes

Classification scheme: International Classification of Functioning, Disability and Health 2001

Representation class: Code

Data type: String

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	0	No impairment
	1	Mild impairment
	2	Moderate impairment
	3	Severe impairment
	4	Complete impairment
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use: This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

Impairments of body structure or body function are problems in body structure or function such as a loss or significant departure from population standards or averages.

CODE 0 No impairment

Used when there is no significant variation from accepted population standards in the biomedical status of the body structure or its functions [0-4%].

CODE 1 Mild impairment

Used when there is a slight or low variation from accepted population standards in the biomedical status of the body structure or its functions [5-24%].

CODE 2 Moderate impairment

Used when there is a medium (significant but not severe) variation from accepted population standards in the biomedical status of the body structure or its functions [25-49%].

CODE 3 Severe impairment

Used when there is an extreme variation from accepted population standards in the biomedical status of the body structure or its functions [50-95%].

CODE 4 Complete impairment

Used when there is a total variation from accepted population standards in the biomedical status of the body structure or its functions [96-100%].

Indicator procedure

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—indicator procedure, code NN
METeOR identifier:	472513
Registration status:	Health, Standard 13/12/2011
Definition:	Indicator procedure for which an elective surgery patient is waiting, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—indicator procedure

Value domain attributes

Representational attributes

Classification scheme:	Australian Classification of Health Interventions (ACHI) 7th edition
Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
01	Cataract extraction
02	Cholecystectomy
03	Coronary artery bypass graft
04	Cystoscopy
05	Haemorrhoidectomy
06	Hysterectomy
07	Inguinal herniorrhaphy
08	Myringoplasty
09	Myringotomy
10	Prostatectomy
11	Septoplasty

	12	Tonsillectomy
	13	Total hip replacement
	14	Total knee replacement
	15	Varicose veins stripping and ligation
Supplementary values:	88	Other

Data element attributes

Collection and usage attributes

Guide for use:

The procedure terms are defined by the Australian Classification of Health Interventions (ACHI) codes which are listed in comments below. Where a patient is awaiting more than one indicator procedure, all codes should be listed. This is because the intention is to count procedures rather than patients in this instance.

These are planned procedures for the waiting list, not what is actually performed during hospitalisation.

Comments:

The list of indicator procedures may be reviewed from time to time. Some health authorities already code a larger number of waiting list procedures.

Waiting list statistics for indicator procedures give a specific indication of performance in particular areas of elective care provision. It is not always possible to code all elective surgery procedures at the time of addition to the waiting list. Reasons for this include that the surgeon may be uncertain of the exact procedure to be performed, and that the large number of procedures possible and lack of consistent nomenclature would make coding errors likely. Furthermore, the increase in workload for clerical staff may not be acceptable. However, a relatively small number of procedures account for the bulk of the elective surgery workload. Therefore, a list of common procedures with a tendency to long waiting times is useful. Waiting time statistics by procedure are useful to patients and referring doctors. In addition, waiting time data by procedure assists in planning and resource allocation, audit and performance monitoring.

The following is a list of ACHI (7th edition) codes, for the indicator procedures:

Cataract extraction:

42698-00 [195] 42702-00 [195] 42702-01 [195] 42698-01 [196] 42702-02 [196]

	3	Both Aboriginal and Torres Strait Islander origin
	4	Neither Aboriginal nor Torres Strait Islander origin
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

This metadata item is based on the Australian Bureau of Statistics (ABS) standard for Indigenous status. For detailed advice on its use and application please refer to the ABS Website as indicated in the Reference documents.

The classification for Indigenous status has a hierarchical structure comprising two levels. There are four categories at the detailed level of the classification which are grouped into two categories at the broad level. There is one supplementary category for 'not stated' responses. The classification is as follows:

Indigenous:

- Aboriginal but not Torres Strait Islander origin.
- Torres Strait Islander but not Aboriginal origin.
- Both Aboriginal and Torres Strait Islander origin.

Non-Indigenous:

- Neither Aboriginal nor Torres Strait Islander origin.

Not stated/ inadequately described:

This category is not to be available as a valid answer to the questions but is intended for use:

- Primarily when importing data from other data collections that do not contain mappable data.
- Where an answer was refused.
- Where the question was not able to be asked prior to completion of assistance because the client was unable to communicate or a person who knows the client was not available.

Only in the last two situations may the tick boxes on the questionnaire be left blank.

Data element attributes

Collection and usage attributes

Collection methods:

The standard question for Indigenous Status is as follows:

[Are you] [Is the person] [Is (name)] of Aboriginal or Torres Strait Islander origin?

(For persons of both Aboriginal and Torres Strait Islander origin, mark both 'Yes' boxes.)

No..

Yes, Aboriginal..............................

Yes, Torres Strait Islander............

This question is recommended for self-enumerated or interview-based collections. It can also be used in circumstances where a close relative, friend, or another member of the household is answering on behalf of the subject. It is strongly recommended that this question be asked directly wherever possible.

When someone is not present, the person answering for them should be in a position to do so, i.e. this person must know well the person about whom the question is being asked and feel confident to provide accurate information about them.

This question must always be asked regardless of data collectors' perceptions based on appearance or other factors.

The Indigenous status question allows for more than one response. The procedure for coding multiple responses is as follows:

If the respondent marks 'No' and either 'Aboriginal' or 'Torres Strait Islander', then the response should be coded to either Aboriginal or Torres Strait Islander as indicated (i.e. disregard the 'No' response).

If the respondent marks both the 'Aboriginal' and 'Torres Strait Islander' boxes, then their response should be coded to 'Both Aboriginal and Torres Strait Islander Origin'.

If the respondent marks all three boxes ('No', 'Aboriginal' and 'Torres Strait Islander'), then the response should be coded to 'Both Aboriginal and Torres Strait Islander Origin' (i.e. disregard the 'No' response).

This approach may be problematical in some data collections, for example when data are collected by interview or using screen based data capture systems. An additional response category

Yes, both Aboriginal and Torres Strait Islander...

may be included if this better suits the data collection practices of the agency or establishment concerned.

Comments:

The following definition, commonly known as 'The Commonwealth Definition', was given in a High Court judgement in the case of Commonwealth v Tasmania (1983) 46 ALR 625.

'An Aboriginal or Torres Strait Islander is a person of Aboriginal or Torres Strait Islander descent who identifies as an Aboriginal or Torres Strait Islander and is accepted as such by the community in which he or she lives'.

There are three components to the Commonwealth definition:

- descent;
- self-identification; and
- community acceptance.

In practice, it is not feasible to collect information on the community acceptance part of this definition in general purpose statistical and administrative collections and therefore standard questions on Indigenous status relate to descent and self-identification only.

Individual sessions (public psychiatric, alcohol and drug hospital)—emergency and outpatient

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment (public psychiatric or alcohol and drug hospital)—number of individual session occasions of service for non-admitted patients (emergency and outpatient), total N[NNNNNN]

Synonymous names: Type of non-admitted patient care (public psychiatric, alcohol & drug) - emergency and outpatient individual sessions

METeOR identifier: 270216

Registration status: Health, Standard 01/03/2005

Definition: The total number of occasions of examination, consultation, treatment or other services provided as individual sessions to non-admitted patients in the emergency and outpatient functional unit of a public psychiatric or alcohol and drug hospital.

Data Element Concept: Establishment—number of individual session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNNNN]

Maximum character length: 7

Unit of measure: Occasion of service

Data element attributes

Collection and usage attributes

Guide for use: Emergency patients and outpatients are persons who receive non-admitted care. Individual non-admitted care is care provided to a person who receives direct care within the **emergency department** or other designated clinics within the hospital and who is not formally admitted at the time when the care is provided. A person who first contacts the hospital and receives non-admitted care, for example through the emergency department, and is subsequently admitted should have both components of care enumerated separately.

Comments: A group is defined as two or more patients receiving a service together where all individuals are not members of the same family. Family services are to be treated as occasions of service to an individual.

Collection and usage attributes

Guide for use:

For occasions of service as individual sessions to non-admitted patients attending designated drug and alcohol units within hospitals.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Each diagnostic test or simultaneous set of related diagnostic tests for the one patient referred to a hospital pathology department consists of one occasion of service.

The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients.

This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary. For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

Synonymous names: Type of non-admitted patient care - dialysis individual sessions

METeOR identifier: 270503

Registration status: Health, Standard 01/03/2005

Definition: The total number of occasions of examination, consultation, treatment or other services provided as individual sessions to non-admitted patients in the dialysis functional unit of an establishment.

Data Element Concept: Establishment—number of individual session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNNNN]

Maximum character length: 7

Unit of measure: Occasion of service

Data element attributes

Collection and usage attributes

Guide for use: Dialysis:

This represents all non-admitted patients receiving dialysis within the establishment. Where patients receive treatment in a ward or clinic classified elsewhere (for example, an emergency department), those patients are to be counted as dialysis patients and to be excluded from the other category. All forms of dialysis which are undertaken as a treatment necessary for renal failure are to be included.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a separation is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Guide for use:

For occasions of service as individual sessions by district nursing services to non-admitted patients.

District nursing services:

- are for medical/surgical/psychiatric care
- are provided by a nurse, paramedic or medical officer
- involve travel by the service provider*
- are not provided by staff from a unit classified in the community health category above.

*Travel does not include movement within an establishment, movement between sites in a multi-campus establishment or between establishments. Such cases should be classified under the appropriate non-admitted patient category.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

Collection methods:

The definition does not distinguish case complexity for non-admitted patients.
For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients.

This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary. For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

Guide for use:

Emergency services:

Services to patients who are not admitted and who receive treatment that was either unplanned or carried out in designated emergency departments within a hospital. Unplanned patients are patients who have not been booked into the hospital before receiving treatment. In general it would be expected that most patients would receive surgical or medical treatment. However, where patients receive other types of treatment that are provided in emergency departments these are to be included. The exceptions are for dialysis and endoscopy and related procedures which have been recommended for separate counting.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Guide for use: For all occasions of endoscopy and related procedures provided as individual sessions to non-admitted patients.

Endoscopy and related procedures include:

- cystoscopy
- gastroscopy
- oesophagoscopy

- duodenoscopy
- colonoscopy
- bronchoscopy
- laryngoscopy.

Where one of these procedures is carried out in a ward or clinic classified elsewhere, for example in the emergency department, the occasion is to be included under endoscopy and related procedures, and to be excluded from the other category. Care must be taken to ensure procedures for admitted patients are excluded from this category.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Guide for use:

For occasions of outreach services as individual sessions to non-admitted patients.

Other outreach services:

- involve travel by the service provider*
- are not classified in allied health or community health services above.

*Travel does not include movement within an establishment, movement between sites in a multi-campus establishment or between establishments. Such cases should be classified under the appropriate non-admitted patient category.

It is intended that these activities should represent non-medical/surgical/psychiatric services. Activities such as home cleaning, meals on wheels, home maintenance and so on should be included.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Comments:

Outreach/community care is care delivered by hospital employees to the patient in the home, place of work or other non-hospital site. The distinction between non-admitted patient care and outreach care is that for non-admitted patient care the patients travel to the health care providers while for outreach care the health care providers travel to the patients.

This distinction creates difficulties for community health centres. These centres are to be included in the national minimum data set where they are funded as sections within establishments that fall within the scope of the National Health Data Dictionary. For example, baby clinics, immunisation groups or aged care assessment teams, which are funded through acute hospitals, may provide care to some clients within the hospital grounds or externally. It is intended that all community health activity be measured under community health regardless of where the services are provided.

Those drugs dispensed/administered in other departments such as the emergency department, or outpatient departments, are to be counted by the respective departments.

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

The list of Type of non-admitted patient care categories was to be developed using typical functional units or cost centres within existing institutions. These would include designated wards or departments and specialised clinics. Although the current statistical/financial returns submitted to the various health authorities by their hospitals do not provide a minimum subset, an effort has been made to define the categories in respect to those areas commonly collected. Many functional units provide services to both admitted patients and non-admitted patients, for example pathology. Only occasions of service for non-admitted patients should be included in this section.

Collection methods: The definition does not distinguish case complexity for non-admitted patients.

For example, an occasion of service could vary in complexity from a simple urine glucose test to a complete biochemical analysis of all body fluids. Ideally, average case complexity values would be available for the various categories of non-admitted patients in the same way that average diagnosis related group weighted separations are becoming available for acute admitted patients. However, such measures would require the development of patient record databases for non-admitted patients. This does not imply an inadequacy in definition.

For admitted patients the concept of a **separation** is widely accepted. Separations can vary between admission for overnight observation to open heart surgery. The issue of case complexity for both admitted and non-admitted patients is a separate issue and beyond the scope of the proposed summary establishment-level activity data.

Individual sessions—radiology and organ imaging

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—number of individual session occasions of service for non-admitted patients (radiology and organ imaging), total N[NNNNNN]

Synonymous names: Type of non-admitted patient care

METeOR identifier: 270510

Registration status: Health, Standard 01/03/2005

Definition: The total number of occasions of examination, consultation, treatment or other services provided as individual sessions to non-admitted patients in the radiology and organ imaging functional unit of an establishment.

Data Element Concept: Establishment—number of individual session occasions of service for non-admitted patients

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNNNN]

Maximum character length: 7

Unit of measure: Occasion of service

Data element attributes

Collection and usage attributes

Guide for use:

For all occasions of radiology and organ imaging services as individual sessions to non-admitted patients.

Radiology and organ imaging includes services undertaken in radiology (X-ray) departments as well as in specialised organ imaging clinics carrying out ultrasound, computerised tomography (CT) and magnetic resonance imaging (MRI).

This metadata item identifies types of services provided to non-admitted patients in different institutional ways in different systems. It is not a summary casemix classification.

A patient who first contacts the hospital and receives non-admitted care, for example through emergency departments, and is subsequently admitted, should have both components of care enumerated separately. Where possible, non-admitted occasions of service that are provided to patients who are subsequently admitted should be identified as a subset of the total occasions of service.

Infant weight, neonate, stillborn

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Birth—birth weight, total grams NNNN
METeOR identifier:	269938
Registration status:	Health, Standard 01/03/2005
Definition:	The first weight, in grams, of the live-born or stillborn baby obtained after birth, or the weight of the neonate or infant on the date admitted if this is different from the date of birth.
Data Element Concept:	Birth—birth weight

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	NNNN
Maximum character length:	4
Unit of measure:	Gram (g)

Data element attributes

Collection and usage attributes

Guide for use:

For **live births**, **birthweight** should preferably be measured within the first hour of life before significant postnatal weight loss has occurred. While statistical tabulations include 500 g groupings for birthweight, weights should not be recorded in those groupings. The actual weight should be recorded to the degree of accuracy to which it is measured.

In perinatal collections the birthweight is to be provided for liveborn and stillborn babies.

Weight on the date the infant is admitted should be recorded if the weight is less than or equal to 9000g and age is less than 365 days.

Influence of environmental factor

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—extent of environmental factor influence, code (ICF 2001) [X]N

METeOR identifier: 320198

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: The degree to which a specified environmental factor influences the body function or structure, the activity or participation of a person, as represented by a code.

Context: The environment in which a person functions or experiences disability.

Data Element Concept: Person—extent of environmental factor influence

Value domain attributes

Representational attributes

Classification scheme: International Classification of Functioning, Disability and Health 2001

Representation class: Code

Data type: String

Format: [X]N

Maximum character length: 2

Permissible values:

Value	Meaning
0	No barrier
1	Mild barrier
2	Moderate barrier
3	Severe barrier
4	Complete barrier
+0	No facilitator
+1	Mild facilitator
+2	Moderate facilitator

	+3	Substantial facilitator
	+4	Complete facilitator
Supplementary values:	8	Barrier not specified
	+8	Facilitator not specified
	9	Not applicable

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

Extent of influence of environmental factors corresponds to the degree, strength or magnitude of the influence and the amount of time the influence is experienced by the person. It is essentially a summary measure, in which are embedded the concepts of availability, quality and importance, that indicates the effect the specified environmental factor has on the person.

Whether, and by how much, environmental factors are influencing an individual's level of functioning, and whether the influence is a facilitator or barrier, may indicate the sorts of interventions that will optimise the individual's functioning. This information may be for policy development, service provision, or advocacy purposes. Preventative strategies could be indicated by this information.

This value domain can be used to collect information across the whole spectrum of influence, for example, tactile flooring may be a facilitator to a person with visual impairment and a barrier to a person with mobility impairments. In line with the ICF approach to functioning and disability, this value domain recognises, and gives the means to record, the positive influence of environmental factors as well as those factors that limit the level of functioning of a person.

The codes are mutually exclusive. The choice of codes depends on the context of the data collection. For example; if collecting information about the positive influence of an environmental factor such as a community service it would be appropriate to use Code 0 No facilitator if the service was not influencing the person's level of functioning (even if the service were not a barrier to the person's functioning).

Code +0 No facilitator:

Used when the environment factor does not impact in a positive way on the body structure or function, activity or participation of a person.

Code +1 Mild facilitator:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 5-24% of the time the person participates in the specified domain of functioning or has a low level of impact on the person's functioning.

Code +2 Moderate facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 25-49% of the time the person participates in the specified domain of functioning or has a significant, but moderate impact on the person's functioning.

Code +3 Substantial facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 50-95% of the time the person participates in the specified domain of functioning or has an extreme effect on the person's functioning.

Code +4 Complete facilitators:

Used when the environmental factor impacts in a positive way on the body structure or function, activity or participation of a person between 96-100% of the time the person participates in the specified domain of functioning or the person functions optimally with this environmental factor.

Code +8 Facilitator not specified:

Used when there is insufficient information to record the Extent of environmental influence code (ICF 2001) N in classes +1 to +4.

Code 0 No barrier:

Used when the environment factor does not impact in a negative way on the body structure or function, activity or participation of a person.

Code 1 Mild barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 5-24% of the time the person participates in the specified domain of functioning or has a low level of impact on the person's functioning.

Code 2 Moderate barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 25-49% of the time the person participates in that specified domain of functioning or has a significant, but moderate impact on the person's functioning.

Code 3 Severe barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 50-95% of the time the person participates in that specified domain of functioning or has an extreme effect on the person's functioning.

Code 4 Complete barriers:

Used when the environmental factor impacts in a negative way on the body structure or function, activity or participation of a person between 96-100% of the time the person participates in the specified domain of functioning or is of such magnitude that the person is unable to function.

Code 8 Barrier not specified:

Used when there is insufficient information to record the Extent of environmental influence code (ICF 2001) N in classes 1 to 4.

Code 9 Not applicable:

Used when environmental factors impacts in neither a positive or negative way on the body structure or function, activity or participation of a person or for between 0-4% of the time the person participates in that specified area and has minimal impact on the person's level of functioning in the specified domain.

Data element attributes

Collection and usage attributes

Guide for use:

Environmental factors represent the circumstances in which the individual lives. These factors are conceived as immediate (e.g. physical features of the environment, social environment) and societal (formal and informal social structures, services and systems). Different environments may have a very different impact on the same individual with a given health condition.

The influence of environmental factors may be positive, increasing the level of functioning (a facilitator), or negative, decreasing the level of functioning (a barrier).

The extent of influence of the **Environmental factors** is affected both by the degree, strength of influence, and the amount of time the influence is experienced by the person.

This metadata item is recorded in conjunction with *Environmental factor code N* to indicate the extent to which specified environmental factors influence the body function or structure, the activity or participation of a person.

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

Informal carers may include those people who receive a pension or benefit for their caring role and people providing care under family care agreements. Excluded from the definition of informal carers are volunteers organised by formal services and paid workers.

This metadata item is purely descriptive of a client's circumstances. It is not intended to reflect whether the informal carer is considered by the service provider to be capable of undertaking the caring role. The expressed views of the client and/or their carer should be used as the basis for determining whether the client is recorded as having an informal carer or not.

When asking a client whether they have an informal carer, it is important for agencies or establishments to recognise that a carer does not always live with the person for whom they care. That is, a person providing significant care and assistance to the client does not have to live with the client in order to be called an informal carer.

Collection methods:

Agencies or establishments and service providers may collect this item at the beginning of each service episode and /or assess this information at subsequent assessments.

Some agencies, establishments/providers may record this information historically so that they can track changes over time. Historical recording refers to the practice of maintaining a record of changes over time where each change is accompanied by the appropriate date.

Examples of questions that have been used for data collection include:

Home and Community Care NMDS

'Do you have someone who helps look after you?'

Commonwealth State/Territory Disability Agreement NMDS

'Does the service user have an informal carer, such as ***family*** *member, friend or neighbour, who provides care and assistance on a regular and sustained basis?*

Comments:

Recent years have witnessed a growing recognition of the critical role that informal support networks play in caring for frail older people and people with disabilities within the community. Not only are informal carers responsible for maintaining people with often high levels of functional dependence within the community, but the absence of an informal carer is a significant risk factor contributing to institutionalisation. Increasing interest in the needs of carers and the role they play has prompted greater interest in collecting more reliable and detailed information about carers and the relationship between informal care and the provision of and need for formal services.

This definition of informal carer is not the same as the Australian Bureau of Statistics (ABS) definition of principal carer, 2003 Survey of Disability, Ageing and Carers and primary carer used in the 1998 survey. The ABS definitions require that the carer has or will provide care for a certain amount of time and that they provide certain types of care.

The ABS defines a primary carer as a person of any age who provides the most informal assistance, in terms of help or supervision, to a person with one or more disabilities. The assistance has to be ongoing, or likely to be ongoing, for at least six months and be provided for one or more of the core activities (communication, mobility and self care). This may not be appropriate for community services agencies wishing to obtain information about a person's carer regardless of the amount of time that care is for, or the types of care provided.

Information such as the amount of time for which care is provided can of course be collected separately but, if it were not needed, it would place a burden on service providers.

Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Last injected three months ago or less
	2	Last injected more than three months ago but less than or equal to twelve months ago
	3	Last injected more than twelve months ago
	4	Never injected
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Collection methods:

To be collected on commencement of treatment with a service.

For clients whose treatment episode is related to the alcohol and other drug use of another person, this metadata item should not be collected.

Comments:

This metadata item has been developed for use in clinical settings. A code that refers to a three-month period to define ‘current’ injecting drug use is required as a clinically relevant period of time.

The metadata item may also be used in population surveys that require a longer timeframe, for example to generate 12-month prevalence rates, by aggregating Codes 1 and 2. However, caution must be exercised when comparing clinical samples with population samples.

This metadata item is important for identifying patterns of drug use and harms associated with injecting drug use.

Registration status: Health, Standard 01/10/2008

Definition: The location of the person's bleeding episode, arising from an instrumented site, as represented by a code.

Data Element Concept: Person with acute coronary syndrome—bleeding location

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N[N]

Maximum character length: 2

	Value	Meaning
Permissible values:	1	Percutaneous coronary procedure arterial access site
	2	Coronary artery bypass graft site
	3	Gastrointestinal site
	4	Genitourinary site
	5	Intracranial site
	6	Pulmonary site
	7	Pericardial site
	8	Other site(s)
	9	Unidentified site
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Percutaneous coronary procedure arterial access site

Use this code when the person's bleeding is originating from the site of arterial access for a percutaneous coronary procedure. Procedures may include cardiac catheterisation, percutaneous coronary intervention, angiogram, intra-aortic balloon pump and/or arterial pressure monitoring sheaths.

CODE 2 Coronary artery bypass graft site

Use this code when the person's bleeding is originating from the site of a coronary artery bypass graft.

CODE 3 Gastrointestinal site

Use this code when the person's bleeding is originating from the gastrointestinal area with mechanical instrumentation.

CODE 4 Genitourinary site

Use this code when the person's bleeding is originating from the genitourinary area with mechanical instrumentation.

CODE 5 Intracranial site

Use this code when the person's bleeding is originating from an intracranial site with mechanical instrumentation.

CODE 6 Pulmonary site

Use this code when the person's bleeding is originating from a pulmonary site with mechanical instrumentation.

CODE 7 Pericardial site

Use this code when the person's bleeding is originating from the pericardium, following percutaneous coronary intervention. This code does not include bleeding that is secondary to a coronary artery bypass graft.

CODE 8 Other site(s)

Use this code when the person's bleeding is originating from a site with mechanical instrumentation that is not listed in codes 1-7, such as central line access.

CODE 9 Unidentified site

Use this code when the person has a fall in haemoglobin without an identifiable instrumented site of bleeding.

CODE 99 Not stated/inadequately described

Not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: Record the location of all bleeding events that occur. More than one code can be applied.

Intended place of birth

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Birth event—setting of birth (intended), code N

METeOR identifier: 269980

Registration status: Health, Standard 01/03/2005

Definition: The intended place of birth at the onset of labour, as represented by a code.

Context: Perinatal care

Data Element Concept: Birth event—setting of birth

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:		
	1	Hospital, excluding birth centre
	2	Birth centre, attached to hospital
	3	Birth centre, free standing
	4	Home
	8	Other
Supplementary values:	9	Not stated

Collection and usage attributes

Comments: The development of a definition of a birth centre is currently under consideration by the Commonwealth in conjunction with the states and territories.

Data element attributes

Collection and usage attributes

Guide for use:

Code 1 Hospital, excluding birth centre

Hospital, excluding birth centre, includes for women who have elective caesarean sections

Code 4 Home

Home, should be restricted to the home of the woman or a relative or friend.

Code 8 Other

Other, includes community (health) centres.

Comments:

Women who plan to give birth in birth centres or at home usually have different risk factors for outcome compared to those who plan to give birth in hospitals. Women who are transferred to hospital after the onset of labour have increased risks of intervention and adverse outcomes.

Inter-hospital contracted patient

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of care—inter-hospital contracted patient status, code N
METeOR identifier:	472024
Registration status:	Health, Standard 11/04/2012
Definition:	An episode of care for an admitted patient whose treatment and/or care is provided under an arrangement between a hospital purchaser of hospital care (contracting hospital) and a provider of an admitted service (contracted hospital), and for which the activity is recorded by both hospitals, as represented by a code.
Data Element Concept:	Episode of care—inter-hospital contracted patient status

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
		Contracted (destination) hospital
	1	Inter-hospital contracted patient from public sector hospital
	2	Inter-hospital contracted patient from private sector hospital
		Contracting (originating) hospital
	3	Inter-hospital contracted patient to public sector hospital
	4	Inter-hospital contracted patient to private sector hospital
	5	Not inter-hospital contracted
Supplementary values:	9	Not stated

Data element attributes

Collection and usage attributes

Guide for use:

Hospital activity provided under contract is to be reported by both the contracting (originating) hospital and by the contracted (destination) hospital, where the activity is recorded by both hospitals.

A specific arrangement should apply (either written or verbal) whereby one hospital contracts with another hospital for the provision of specific services. The arrangement may be between any combination of hospital; for example, public to public, public to private, private to private, or private to public.

This data element is designed to enable elimination of double counting of episodes of admitted patient care in national data compiled as per the APC NMDS. As such, contracted arrangements where the patient is only admitted to one hospital (i.e. contract type 4 where contract role=A) are not considered to be inter-hospital contracted care for the purposes of this data element. In contracted arrangements where the patient is admitted to both hospitals, provide data according to the guide for use below. In contracted arrangements where the patient is only admitted to one hospital, use code 5.

This data element item will be derived, using data elements Hospital—contract role, code A and Hospital—contract type, code N as follows.

If Contract role = B (Hospital B, that is, the provider of the hospital service; contracted hospital), and Contract type = 2, 3, or 5 (that is, a hospital (Hospital A) purchases the activity, rather than a health authority or other external purchaser, and admits the patient for all or part of the episode of care, and/or records the contracted activity within the patient's record for the episode of care). Then record a value of 1, if Hospital A is a public hospital or record a value of 2, if Hospital A is a private hospital.

If Contract role = A (Hospital A, that is, the hospital purchasing the activity; contracting hospital), and Contract type = 2, 3, or 5 (that is, the reporting hospital purchases the activity and admits the patient for all or part of the episode of care, and/or records the contracted activity within the patient's record for the episode of care). Then record a value of 3, if Hospital B is a public hospital or record a value of 4, if Hospital B is a private hospital.

Collection methods: All services provided at both the originating and destination hospitals should be recorded and reported by both hospitals. The destination hospital should record the admission as an 'Inter-hospital contracted patient' so that these services can be identified in the various statistics produced about hospital activity.

Data element attributes

Collection and usage attributes

Guide for use:

This data element is applicable to all health professionals who are not employed in Australia in the registered profession. It includes health professionals who are:

- employed in the registered profession overseas
- employed outside of the registered profession, and
- not employed at all.

Data are self-reported based on the jobseeker status in the registered profession in the week before registration.

CODE 1 LOOKING FOR WORK IN AUSTRALIA

This category includes persons who are not currently employed in the registered profession in Australia and who are actively looking for work in the registered profession in Australia.

'Actively looking for work' includes writing, telephoning or applying in person to an employer for work. It also includes answering a newspaper advertisement for a job, checking factory or job placement agency notice boards, being registered with a job placement agency, checking or registering with any other employment agency, advertising or tendering for work or contacting friends or relatives.

CODE 2 NOT LOOKING FOR WORK IN AUSTRALIA

All persons who are not 'looking for work in Australia' as defined above.

Collection and usage attributes

Guide for use:

Rales or crepitations represent evidence of pulmonary interstitial oedema on lung auscultation and an S_3 is an audible extra heart sound by cardiac auscultation.

CODE 1 Class 1

Absence of crepitations/rales over the lung fields and absence of $S_{3.}$

CODE 2 Class 2

Crepitations/rales over 50% or less of the lung fields or the presence of an $S_{3.}$

CODE 3 Class 3

Crepitations/rales over more than 50% of the lung fields.

CODE 4 Class 4

Cardiogenic Shock. Clinical criteria for cardiogenic shock are hypotension (a systolic blood pressure of less than 90 mmHg for at least 30 minutes or the need for supportive measures to maintain a systolic blood pressure of greater than or equal to 90 mmHg), end-organ hypoperfusion (cool extremities or a urine output of less than 30 ml/h, and a heart rate of greater than or equal to 60 beats per minute). The haemodynamic criteria are a cardiac index of no more than 2.2 l/min per square meter of body-surface area and a pulmonary-capillary wedge pressure of at least 15 mmHg.

Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Employed
	2	Unemployed
	3	Not in the labour force
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Employed:

Persons aged 15 years and over who, during the reference week:

(a) worked for one hour or more for pay, profit, commission or payment in kind in a job or business, or on a farm (comprising 'Employees', 'Employers' and 'Own Account Workers'); or

(b) worked for one hour or more without pay in a family business or on a farm (i.e. 'Contributing Family Worker'); or

(c) were 'Employees' who had a job but were not at work and were:

- on paid leave
- on leave without pay, for less than four weeks, up to the end of the reference week
- stood down without pay because of bad weather or plant

breakdown at their place of employment, for less than four weeks up to the end of the reference week

- on strike or locked out
- on workers' compensation and expected to be returning to their job, or
- receiving wages or salary while undertaking full-time study; or

(d) were 'Employers', 'Own Account Workers' or 'Contributing Family Workers' who had a job, business or farm, but were not at work.

CODE 2 Unemployed:

Unemployed persons are those aged 15 years and over who were not employed during the reference week, and:

(a) had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week. Were available for work in the reference week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the reference week). Or were waiting to start a new job within four weeks from the end of the reference week and would have started in the reference week if the job had been available then; or

(b) were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the reference week (including the whole of the reference week) for reasons other than bad weather or plant breakdown. Note: Actively looking for work includes writing, telephoning or applying in person to an employer for work. It also includes answering a newspaper advertisement for a job, checking factory or job placement agency notice boards, being registered with a job placement agency, checking or registering with any other employment agency, advertising or tendering for work or contacting friends or relatives.

CODE 3 Not in the Labour Force:

Persons not in the labour force are those persons aged 15 years and over who, during the reference week, were not in the categories employed or unemployed, as defined. They include persons who were keeping house (unpaid), retired, voluntarily inactive, permanently unable to work, persons in institutions (hospitals, gaols, sanatoriums, etc.), trainee teachers, members of contemplative religious orders, and persons whose only activity during the reference week was jury service or unpaid voluntary work for a charitable organisation.

Labour force status 30 days prior to imprisonment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Prison entrant—labour force status 30 days prior to imprisonment, code N
METeOR identifier:	410617
Registration status:	Health, Standard 25/08/2011
Definition:	The self-reported labour force status of a prison entrant 30 days prior to imprisonment, as represented by a code.
Data Element Concept:	Prison entrant—labour force status 30 days prior to imprisonment

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Full-time work
	2	Part-time work or casual work
	3	Unemployed and looking for work
	4	Unemployed and not looking for work
	5	Unable to work due to disability, age or health condition
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Only one option may be selected.

CODE 1 Full-time work:

Employed persons are working full-time if they:

(a) usually work 35 hours or more in a week (in all paid jobs) or

(b) although usually work less than 35 hours a week, actually worked 35 hours or more a week during the 30 days prior to being imprisoned.

CODE 2 Part-time or casual work:

Employed persons are working part-time if they usually work less than 35 hours a week (in all paid jobs) during the

30 days prior to being imprisoned.

A person's employment is classed as casual work if they are not entitled to paid sick or holiday leave and considered their job to be casual, and who either: worked in someone else's business or reported that they worked in their own unincorporated business but did not invoice clients for own payment and paid PAYE tax.

CODE 3 and 4 Unemployed and looking for work/not looking for work:

Unemployed persons are defined as all persons 15 years of age and over who were not employed during the 30 days prior to being imprisoned, and

- had actively looked for full-time or part-time work at any time in the 30 days prior to being imprisoned and were available for work during that period or
- were waiting to start a new job within the 30 days prior to being in prison

'Looking for work' encompasses a range of formal and informal job search activities and includes: writing, telephoning or applying in person to an employer for work, answering an advertisement for a job, checking workplace noticeboards or the touchscreens at Centrelink offices, being registered as a job seeker with Centrelink, being registered with a Job Network agency or any other employment agency, advertising or tendering for work, and contacting friends or relatives. People actively looking for self-employment jobs (such as looking for a business or to purchase a lease) are also treated as looking for work. People who only looked in newspapers or read job advertisements are seen as passively, rather than actively, looking for work and so are not considered unemployed.

CODE 9 Not stated/ inadequately described:

Is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Laterality of primary cancer

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—laterality of primary cancer, code [N]

METeOR identifier: 422769

Registration status: Health, Standard 07/12/2011

Definition: The side of a paired organ that is the origin of the primary cancer in a person with cancer, as represented by a code.

Data Element Concept: Person with cancer—laterality of primary cancer

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: A

Maximum character length: 1

	Value	Meaning
Permissible values:	R	Right
	L	Left
	B	Bilateral
Supplementary values:	N	Not applicable
	U	Unknown

Data element attributes

Collection and usage attributes

Guide for use: Record the appropriate code at the time of diagnosis.

Definitions

Right:

Origin of primary site is on the right side of a paired organ.

Left:

Origin of primary site is on the left side of a paired organ.

Bilateral:

Origin of primary site is on both sides of a paired organ. (When tumours of the same morphology are diagnosed simultaneously in both sides of a paired organ.)

Includes organs that are bilateral as a single primary (e.g. bilateral retinoblastoma (M9510/3, C69.2), (M9511/3, C69.2), (M9512/3, C69.2), (C69.6, C48.0), bilateral Wilms tumours (C64.9, M8960/3))

Note: Bilateral cancers are very rare.

Unknown:

It is unknown whether, for a paired organ the origin of the cancer was on the left or right side of the body.

Paired organs and structures

The valid International Classification of Diseases for Oncology values for paired organs are provided in the list below:

C02.4	Lingual tonsil
C07.9	Parotid gland
C08.0	Submandibular gland
C08.1	Sublingual gland
C09.0	Tonsillar fossa
C09.1	Tonsillar pillar
C09.8	Overlapping lesion of tonsil
C09.9	Tonsil, NOS
C11.1	Posterior wall of nasopharynx
C30.0	Nasal cavity (excluding nasal cartilage and nasal septum)
C30.1	Middle ear
C31.0	Maxillary sinus
C31.2	Frontal sinus
C34.0	Main bronchus (excluding carina)
C34.1-C34.9	Lung
C38.4	Pleura
C40.0	Long bones of upper limb and scapula
C40.1	Short bones of upper limb
C40.2	Long bones of lower limb
C40.3	Short bones of lower limb
C41.3	Rib and clavicle (excluding sternum)
C41.4	Pelvic bones (excluding sacrum, coccyx and symphysis pubis)
C44.1	Skin of eyelid
C44.2	Skin of external ear
C44.3	Skin of other and unspecified parts of face
C44.5	Skin of trunk
C44.6	Skin of upper limb and shoulder

C44.7	Skin of lower limb and hip

Leave days from residential care

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of residential care—number of leave days, total N[NN]
METeOR identifier:	379734
Registration status:	Health, Standard 07/12/2011
Definition:	The number of days spent on leave from a residential care service during an episode of residential care.
Data Element Concept:	Episode of residential care—number of leave days

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

A day is measured from midnight to midnight.

Leave days can occur for a variety of reasons, including:

- treatment by a specialised mental health service
- treatment by a non-specialised health service
- time in the community.

The following rules apply in the calculation of leave days:

- the day the **resident** goes on leave is counted as a leave day
- days the resident is on leave are counted as leave days
- the day the resident returns from leave is not counted as a leave day
- if the resident starts a residential stay and goes on leave on the same day, this is not counted as a leave day
- if the resident returns from leave and then goes on leave again on the same day, this is counted as a leave day
- if the resident returns from leave and ends residential care on the same day, the day should not be counted as

leave day

- leave days at the end of a residential stay after the commencement of leave are not counted.

If a resident fails to return from leave, then the residential stay is formally ended.

Guide for use:

CODE 1 Remand

Remand refers to a person who is held in prison while awaiting the outcome of a court hearing.

CODE 2 Sentenced

Sentenced prisoners are those persons who have received a term of imprisonment from a court. This includes offenders who have been given an indeterminate sentence or custodial order, for example, persons detained under the 'Governor's/His/Her Majesty's Pleasure' and forensic patients, or those who have received a life sentence.

Length of stay (including leave days)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care—length of stay (including leave days), total N[NN]
METeOR identifier:	329889
Registration status:	Health, Standard 04/07/2007
Definition:	The total length of stay (LOS) of a patient, including leave days, measured in days.
Data Element Concept:	Episode of admitted patient care—length of stay (including leave days)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

Formula:

LOS (including leave days) = separation date - admission date

Total LOS is calculated by subtracting the patient's date of admission from their date of separation. It includes contract days and leave days.

For babies born in hospital: 1) only calculate the total LOS of live births and 2) their admission date is the same as their date of birth.

A **same-day patient** should be allocated a length of stay of one day.

Total LOS relates to the episode of care associated with the birth.

Babies born before arrival and still births are not within scope of this data element and should not have a total length of stay reported.

Comments:

All admitted patient episodes of care where it is required to know the total LOS in hospital (including leave days).

Length of stay (including leave days) (antenatal)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care—length of stay (including leave days) (antenatal), total N[NN]
METeOR identifier:	290577
Registration status:	Health, Standard 04/07/2007
Definition:	The length of stay (LOS) of a woman before the birth of her baby, including leave days, measured in days.
Context:	Perinatal
Data Element Concept:	Episode of admitted patient care—length of stay (including leave days)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

Formula:

LOS (antenatal) = baby's date of birth - mother's admission date

Antenatal LOS is calculated by subtracting the mother's admission date from the baby's date of birth. It includes contract days and leave days.

If the mother's admission date and the baby's date of birth are on the same date, count the LOS as 1 day.

Antenatal length of stay refers only to the admission associated with the birth.

Antenatal LOS relates only to the episode of admitted patient care associated with the birth.

In a multiple pregnancy, the date of birth of the first baby born should be used to calculate the mother's antenatal LOS.

To calculate the total LOS, use the data element - Episode of admitted patient care - length of stay (including leave days) total.

Letters of family name

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—letters of family name, text XXX
METeOR identifier:	349481
Registration status:	Community Services, Standard 27/03/2007 Housing assistance, Standard 23/08/2010 Health, Standard 07/12/2011 Early Childhood, Standard 21/05/2010 Homelessness, Standard 23/08/2010
Definition:	The combination of 2nd, 3rd and 5th letters of a person's family name.
Data Element Concept:	Person—letters of family name

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	XXX
Maximum character length:	3

Data element attributes

Collection and usage attributes

Guide for use:

In the three spaces, the agency should record the 2nd, 3rd and 5th letters of the client's family name.

For example: If the client's family name is Brown, the reported value should be RON. If the client's family name is Thompson, the reported value should be HOP.

If the client's family name includes non-alphabetic characters—for example hyphens (as in Lee-Archer), apostrophes (as in O'Mara) or blank spaces (as in De Vries)—these non-alphabetic characters should be ignored when counting the position of each character.

Regardless of the length of a person's name, the reported value should always be three characters long. If the legal family name is not long enough to supply the requested letters (i.e. a legal family name of less than five letters) then agencies should substitute the number '2' to reflect the missing letters. The placement of a number '2' should always correspond to the same space that the missing letter would have within the 3-digit field. A number (rather than a letter) is used for such a substitution in order to clearly indicate that an appropriate corresponding letter from the person's name is not available.

For example: If a person's family name is Farr, then value reported would be AR2 because the 2 is substituting for a missing 5th letter of the family name. Similarly, if the person's family name was Hua, then the value reported would be UA2 because the 2 is substituting for the missing 5th letter of the family name.

If a client's family name is missing altogether the agency should record the number 999 for all three spaces associated with the family name, (not the number 2). In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies should always ask the person to specify their legal first given name and their legal family name separately. These should then be recorded as first given name and family name as appropriate, regardless of the order in which they may be traditionally given.

Comments: The selected *Letters of family name* can be used in combination with *Letters of given name, Date of birth* and *Sex* to develop a statistical linkage key to facilitate the linkage of records for statistical purposes only. This key will also enable linkage to other related databases that either have the same linkage key or the fundamental information to form the same key. The linkage is to assist research and analysis of the data, not for tracking of individuals through the system for case management.

The provision of letters of a person's name can be a sensitive issue because of privacy and confidentiality concerns. The use of this information will be in accordance with privacy principles.

Definition: The highest non-school qualification attained by a person, as represented by a code.

Data Element Concept: Person—level of highest non-school qualification

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Trade Certificate (Certificate I-IV)
2	Advanced Diploma and Diploma
3	Bachelor degree
4	Graduate Diploma and Graduate Certificate
5	Postgraduate degree

Supplementary values:

9	Not stated/inadequately described

Collection and usage attributes

Guide for use: Non-school qualifications are awarded for educational attainments other than those of pre-primary, primary or secondary education. They include qualifications at the Postgraduate Degree level, Master Degree level, Graduate Diploma and Graduate Certificate level, Bachelor Degree level, Advanced Diploma and Diploma level, and Certificates I, II, III and IV levels.

CODE 1 Trade Certificate (Certificate I-IV)

Includes Certificate IV, Statement of Attainment at Certificate IV level, Bridging and Enabling Course at Certificate IV level, Certificate III, Statement of Attainment at Certificate III level, Bridging and Enabling Course at Certificate III level, Certificate II, Statement of Attainment at Certificate II level, Bridging and Enabling Course at Certificate II level, Certificate I, and Statement of Attainment at Certificate I level.

CODE 2 Advanced Diploma and Diploma

Includes Advanced Diploma, Statement of Attainment at Advanced Diploma Level, Associate Degree, Statement of Attainment at Associate Degree level, Bridging and Enabling Course at Advanced Diploma and Associate Degree level, Diploma, Statement of Attainment at Diploma level, and Bridging and Enabling Course at Diploma level. Excludes Graduate Diploma.

CODE 3 Bachelor degree

Includes Bachelor (Honours) Degree, Bachelor (Pass) Degree, Statement of Attainment at Bachelor Degree level, and Bridging and Enabling Course at Bachelor Degree level.

CODE 4 Graduate Diploma and Graduate Certificate

Includes Graduate Diploma, Graduate Qualifying or Preliminary, Professional Specialist Qualification at Graduate Diploma level, Statement of Attainment at Graduate Diploma level, Bridging and Enabling Course at Graduate Diploma level, Graduate Certificate, Professional Specialist Qualification at Graduate Certificate level, Statement of Attainment at Graduate Certificate level, and Bridging and Enabling Course at Graduate Certificate level.

CODE 5 Postgraduate degree

Includes Higher Doctorate, Doctorate by Research, Doctorate by Coursework Professional Specialist Qualification at Doctoral Degree level, Statement of Attainment at Doctoral Degree level, Bridging and Enabling Course at Doctoral Degree level, Master Degree by Research, Master Degree by Coursework, Professional Specialist Qualification at Master Degree level, Statement of Attainment at Master Degree level, Bridging and Enabling Course at Master Degree level.

CODE 9 Not stated/inadequately described

This code is not for use on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Comments: The categories in this metadata item are based on the Australian Bureau of Statistics Australian Standard Classification of Education, Level of Education (ASCED) 2001.

CODE 1 Trade Certificate (Certificate I-IV) maps to Broad Level, 5 Certificate Level of the ASCED

CODE 2 Advanced Diploma and Diploma maps to Broad Level 4, Advanced Diploma and Diploma of the ASCED

CODE 3 Bachelor Degree maps to Broad Level 3 Bachelor degree of the ASCED

CODE 4 Graduate Diploma and Graduate Certificate maps to Broad Level 2, Graduate Diploma and Graduate Certificate of the ASCED

CODE 5 Postgraduate degree maps to Broad Level 1 Postgraduate Degree level

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Origin: Australian Bureau of Statistics 2001. Australian Standard Classification of Education (ASCED) 2001. Cat. no. 1272.0. Canberra: ABS

Data element attributes

Collection and usage attributes

Collection methods: Operationally, 'level of highest non-school qualification' is defined as the highest completed non-school qualification reported for a person in any field of education except General Primary and Secondary Education Programmes. Data are obtained by direct question and often sequenced to follow a direct question on 'Highest year of school completed'. The question is worded in terms of qualifications attained and when information is not collected about multiple qualifications, the result is dependent on respondent perception of 'highest'.

The 'Level of highest non-school qualification' excludes partial completion of or current participation in a course of study and Statements of attainment awarded for partial completion of a course of study at a particular level.

Qualifications generally associated with school education, such as the Senior Secondary Certificate of Education, are excluded from this data element even if they are awarded as the result of study at a non-school institution (ABS 2001).

Comments: The level of non-school qualification categories are based on the ABS Australian Standard Classification of Education, Level of Education (ASCED) 2001.

Level of palliative care service

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Service provider organisation—level of service delivery, palliative care code N

METeOR identifier: 334508

Registration status: Health, Standard 05/12/2007

Definition: The level of specialisation of the palliative care service delivered by a **palliative care agency**, as represented by a code.

Data Element Concept: Service provider organisation—level of service delivery

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Primary palliative care
2	Specialist palliative care level 1
3	Specialist palliative care level 2
4	Specialist palliative care level 3

Source and reference attributes

Origin: Palliative Care Australia 2005. A guide to palliative care service development: A population-based approach. Canberra: Palliative Care Australia, p39.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Primary palliative care

Capability: Clinical management and care coordination including assessment, triage, and referral using a palliative approach for patients with uncomplicated needs associated with a life limiting illness and/or end of life care. Has formal links with a specialist palliative care provider for purposes of referral, consultation and access to specialist care as necessary.

Typical resource profile: General medical practitioner, nurse practitioner, registered nurse, generalist community nurse, aboriginal health worker, allied health staff. Specialist health care providers in other disciplines would be included at this level.

CODE 2 Specialist palliative care level 1

Capability: Provides palliative care for patients, primary carers and families whose needs exceed the capability of primary palliative care providers. Provides assessment and care consistent with needs and provides consultative support, information and advice to primary palliative care providers. Has formal links to primary palliative care providers and level 2 and/or 3 specialist palliative care providers to meet the needs of patients, carers and families with complex problems. Has quality and audit program.

Typical resource profile: Multi–disciplinary team including medical practitioner with skills and experience in palliative care, clinical nurse specialist/consultant, allied health staff, pastoral care and volunteers. A designated staff member if available, coordinates a volunteer service.

CODE 3 Specialist palliative care level 2

Capability: As for level 1, able to support higher resource level due to population base (e.g. regional area). Provides formal education programs to primary palliative care and level 1 providers and the community. Has formal links with primary palliative care providers and level 3 specialist palliative care services for patients, primary carers and families with complex needs.

Typical resource profile: Interdisciplinary team including medical practitioner and clinical nurse specialist/consultant with specialist qualifications. Includes designated allied health and pastoral care staff.

CODE 4 Specialist palliative care level 3

Capability: Provides comprehensive care for the needs of patients, primary carers and families with complex needs. Provides local support to primary palliative care providers, regional level 1 and/or 2 services including education and formation of standards. Has a comprehensive research and teaching role. Has formal links with local primary palliative care providers and with specialist palliative care providers level 1 and 2, and relevant academic units including professorial chairs where available.

Typical resource profile: Interdisciplinary team including a medical director and clinical nurse consultant/nurse practitioner and allied health staff with specialist qualifications in palliative care.

	4	Weight management
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Counselling includes any method of individual or group counselling or advice directed towards any of the specific lifestyle behaviours.

This metadata item refers to counselling that was conducted by a healthcare professional during the hospital stay. This may include counselling that was performed in conjunction with referral to a cardiac rehabilitation service.

CODE 1 Diet

Use this code where a person has received counselling on their diet.

CODE 2 Physical activity

Use this code where a person has received counselling encouraging at least 30 to 60 minutes of physical activity in at least five sessions per week.

CODE 3 Smoking cessation

Use this code where a person has received counselling regarding the importance of stopping smoking.

CODE 4 Weight management

Use this code where a person, whose weight is greater than 120% of the ideal weight for height, has received counselling on weight management.

Listing date for care

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective care waiting list episode—listing date for care, DDMMYYYY
METeOR identifier:	269957
Registration status:	Health, Standard 01/03/2005
Definition:	The date on which a hospital or a community health service accepts notification that a patient/client requires care/treatment.
Data Element Concept:	Elective care waiting list episode—listing date for care

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:	For elective surgery, the listing date is the date on which the patient is added to an elective surgery waiting list. The acceptance of the notification by the hospital or community health service is conditional upon the provision of adequate information about the patient and the appropriateness of the patient referral.
Comments:	The hospital or community health service should only accept a patient onto the waiting list when sufficient information has been provided to fulfil state/territory, local and national reporting requirements.

Living arrangement

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—living arrangement, health sector code N

METeOR identifier: 299712

Registration status: Health, Standard 14/06/2005

Definition: Whether a person usually resides alone or with others, as represented by a code.

Context: Client support needs and clinical setting.

Data Element Concept: Person—living arrangement

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Lives alone
	2	Lives with others
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Collection methods: This item does not seek to describe the quality of the arrangements but merely the fact of the arrangement. It is recognised that this item may change on a number of occasions during the course of an episode of care.

Comments: Whether or not a person lives alone is a significant determinant of risk.

Living alone may preclude certain treatment approaches (e.g. home dialysis for end-stage renal disease). Social isolation has also been shown to have a negative impact on prognosis in males with known coronary artery disease with several studies suggesting increased mortality rates in those living alone or with no confidant.

Location of impairment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—location of impairment of body structure, code (ICF 2001) N
METeOR identifier:	320177
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The location of a person's impairment in a specified body structure, as represented by a code.
Context:	Human functioning and disability
Data Element Concept:	Person—location of impairment of body structure

Value domain attributes

Representational attributes

Classification scheme:	International Classification of Functioning, Disability and Health 2001
Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:		
	0	More than one region
	1	Right
	2	Left
	3	Both sides
	4	Front
	5	Back
	6	Proximal
	7	Distal
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use:

This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

Impairments of body structure are problems in body structure such as a loss or significant departure from population standards or averages.

Use only one code. Select the one that best describes the situation with this structure. Combinations are not possible.

CODE 0 More than one region (except both sides)

Used when the impairment is present in more than one body location (but not bilaterally see code 3); for example when burn scars affect many areas of skin.

CODE 1 Right

Used when the impairment is present to the right of the midline of the person's body.

CODE 2 Left

Used when the impairment is present to the left of the midline of the person's body.

CODE 3 Both sides (bilateral)

Used when the impairment is two-sided and disposed on opposite sides of the midline axis of the body, for example bilateral joint deformities.

CODE 4 Front

Used when the impairment is present in front of a line passing through the midline of the body when viewed from the side.

CODE 5 Back

Used when the impairment is present behind a line passing through the midline of the body when viewed from the side.

CODE 6 Proximal

Used when the impairment is situated towards the point of origin or attachment, as of a limb or bone (opposed to distal), for example the end of the structure that is closer to the centre of the body.

CODE 7 Distal

Used when the impairment is situated away from the point of origin or attachment, as of a limb or bone (opposed to proximal), for example the end of structure that is further away from the centre of the body.

CODE 8 Not specified

Used when there is an impairment of body structure but the location of the impairment is not recorded.

CODE 9 Not applicable

Used when it is not appropriate to code the location of an impairment of body structure.

Lot/section number (person)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person (address)—lot/section identifier, N[X(14)]

Synonymous names: Australian lot number, section, allotment

METeOR identifier: 270031

Registration status: Community Services, Superseded 06/02/2012
Health, Standard 01/03/2005

Definition: The unique identifier for the lot/section of the location where a person resides.

Data Element Concept: Person (address)—lot/section identifier

Value domain attributes

Representational attributes

Representation class: Identifier

Data type: String

Format: N[X(14)]

Maximum character length: 15

Data element attributes

Collection and usage attributes

Guide for use: This standard is suitable for postal purposes as well as the physical identification of addresses.

A lot number shall be used only when a street number has not been specifically allocated or is not readily identifiable with the property.

For identification purposes, the word 'Lot' or 'Section' should precede the lot number and be separated by a space.

Examples are as follows:

Section 123456

Lot 716

Lot 534A

Lot 17 Jones Street

Collection methods: The lot/section number is positioned before the Street name and type, located in the same line containing the Street name.

Comments: Lot/section numbers are generally used only until an area has been developed.

Lower limb amputation due to vascular disease

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—lower limb amputation due to vascular disease, code N
METeOR identifier:	270162
Registration status:	Health, Standard 01/03/2005
Definition:	Whether a person has undergone an amputation of toe, forefoot or leg (above or below knee), due to vascular disease, as represented by a code.
Data Element Concept:	Person—lower limb amputation due to vascular disease

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Lower limb amputation - occurred in the last 12 months
	2	Lower limb amputation - occurred prior to the last 12 months
	3	Lower limb amputation - occurred both in and prior to the last 12 months
	4	No history of lower limb amputation due to vascular disease
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Collection methods: Ask the individual if he/she has had an amputated toe or forefoot or leg (above or below knee), not due to trauma or causes other than vascular disease. If so determine when it was undertaken; within or prior to the last 12 months (or both). Alternatively obtain this information from appropriate documentation.

Lymphovascular invasion

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—lymphovascular invasion, code N
METeOR identifier:	370618
Registration status:	Health, Standard 06/03/2009
Definition:	The presence or absence of the invasion of cancer cells into blood vessel(s) and/or the lymphatic system, as represented by a code.
Data Element Concept:	Person with cancer—lymphovascular invasion

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Present
	2	Absent
	3	Suspicious
Supplementary values:	9	Not stated or unknown

Data element attributes

Collection and usage attributes

Guide for use:	The presence of lymphovascular invasion should be recorded as Code 1, regardless of whether the extent of the invasion is described or not.
Collection methods:	For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease. If pathology report pertaining to initial diagnosis is for a metastasis, and not the primary tumour, record as 9.
Comments:	Invasion of the lymphatics or blood vessels by cancer cells is an important prognostic factor that indicates that the tumour is likely to spread. This item is included in data items defined for reporting in the pathology reporting guidelines as prepared by the National Breast and Ovarian Cancer Centre and Australian Cancer Network.

Main language other than English spoken at home

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—main language other than English spoken at home, code (ASCL 2011) NN{NN}

METeOR identifier: 460125

Registration status: Community Services, Standard 13/10/2011
Housing assistance, Standard 13/10/2011
Health, Standard 13/10/2011
Homelessness, Standard 13/10/2011

Definition: The language reported by a person as the main language other than English spoken by that person in his/her home (or most recent private residential setting occupied by the person) to communicate with other residents of the home or setting and regular visitors, as represented by a code.

Data Element Concept: Person—main language other than English spoken at home

Value domain attributes

Representational attributes

Classification scheme: Australian Standard Classification of Languages 2011

Representation class: Code

Data type: Number

Format: NN{NN}

Maximum character length: 4

Collection and usage attributes

Guide for use: The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure. The most detailed level of the classification consists of base units (languages) which are represented by four-digit codes. The second level of the classification comprises narrow groups of languages (the Narrow group level), identified by the first two digits. The most general level of the classification consists of broad groups of languages (the Broad group level) and is identified by the first digit. The classification includes Australian Indigenous languages and sign languages.

For example, the Lithuanian language has a code of 3102. In this case 3 denotes that it is an Eastern European language, while 31 denotes that it is a Baltic language. The Pintupi Aboriginal language is coded as 8713. In this case 8 denotes that it is an Australian Indigenous language and 87 denotes that the language is a Western Desert language.

Language data may be output at the Broad group level, Narrow group level or base level of the classification. If necessary, significant languages within a Narrow group can be presented separately while the remaining languages in the Narrow group are aggregated. The same principle can be adopted to highlight significant Narrow groups within a Broad group.

Do you/Does the person/Does (name) speak a language other than English at home? (If more than one language, indicate the one that is spoken most often.)

No (English only) ____

Yes, Italian ____

Yes, Greek ____

Yes, Cantonese ____

Yes, Arabic ____

Yes, Mandarin ____

Yes, Vietnamese ____

Yes, Spanish ____

Yes, German ____

Yes, Hindi ____

Yes, Other (please specify)

____

This list reflects the nine most common languages other than English spoken in Australia.

Languages may be added or deleted from the above short list to reflect characteristics of the population of interest.

Alternatively a tick box for 'English' and an 'Other - please specify' response category could be used.

Comments:

This metadata item is consistent with that used in the Australian Census of Population and Housing and is recommended for use whenever there is a requirement for comparison with Census data.

This data element is important in identifying those people most likely to suffer disadvantage in terms of their ability to access services due to language and/or cultural difficulties. In conjunction with Indigenous status, Proficiency in spoken English and Country of birth this data element forms the minimum core set of cultural and language indicators recommended by the Australian

Bureau of Statistics (ABS).

Data on main language other than English spoken at home are regarded as an indicator of 'active' ethnicity and also as useful for the study of inter-generational language retention. The availability of such data may help providers of health and community services to effectively target the geographic areas or population groups that need those services. It may be used for the investigation and development of language services such as interpreter/ translation services.

Definition:	The job in which the person is principally engaged, as represented by a code.
Data Element Concept:	Person—occupation (main)

Value domain attributes

Representational attributes

Classification scheme:	Australian and New Zealand Standard Classification of Occupations, First edition, 2006
Representation class:	Code
Data type:	Number
Format:	N[NNN]{NN}
Maximum character length:	6

Data element attributes

Collection and usage attributes

Guide for use:

A job in any given establishment is a set of tasks designed to be performed by one individual in return for a wage or salary. For persons with more than one job, the main job is the one in which the person works the most hours.

Caution is advised in its use with regard to service providers as their activity as a service provider may not be their main occupation.

Collection methods:

This metadata item should only be collected from people whose Labour force status is employed.

Occupation is too complex and diverse an issue to fit neatly into any useable small group of categories. Therefore ABS recommend that this metadata item be collected by using the following two open-ended questions:

Q1. In the main job held last week (or other recent reference period), what was your/the person’s occupation?

Q2. What are the main tasks that you/the person usually perform in that occupation? The information gained from these two questions can then be used to select an appropriate code from the ANZSCO at any of the available levels (see Guide for use section).

If only one question is asked, question one should be used. The use of question one only, however, sometimes elicits responses which do not provide a clear occupation title and specification of tasks performed. As a result accurate coding at unit group or occupation level may not be possible.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, due to the complexities of the metadata item 'Main occupation of person', this will result in inaccurate information. The recommended question should be used wherever possible.

Comments: This metadata item may be useful in gaining an understanding of a client's situation and needs. For example, the occupation of a person with a disability may be directly relevant to the type of aids that they require.

National Health Data Dictionary (NHDD) specific:

Injury surveillance - There is considerable user demand for data on occupation-related injury and illness, including from WorkSafe Australia and from industry, where unnecessary production costs are known in some areas and suspected to be related to others in work-related illness, injury and disability.

Main treatment type for alcohol and other drugs

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—treatment type (main), code N
METeOR identifier:	270056
Registration status:	Health, Standard 01/03/2005
Definition:	The main activity determined at assessment by the treatment provider to treat the client's alcohol and/or drug problem for the principal drug of concern, as represented by a code.
Data Element Concept:	Episode of treatment for alcohol and other drugs—treatment type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Withdrawal management (detoxification)
2	Counselling
3	Rehabilitation
4	Pharmacotherapy
5	Support and case management only
6	Information and education only
7	Assessment only
8	Other

Collection and usage attributes

Guide for use:

CODE 1 Withdrawal management (detoxification)

This code refers to any form of withdrawal management, including medicated and non-medicated, in any delivery setting.

CODE 2 Counselling

This code refers to any method of individual or group counselling directed towards identified problems with alcohol and/or other drug use or dependency. This code excludes counselling activity that is part of a rehabilitation program as defined in Code 3.

CODE 3 Rehabilitation

This code refers to an intensive treatment program that integrates a range of services and therapeutic activities that may include counselling, behavioural treatment approaches, recreational activities, social and community living skills, group work and relapse prevention. Rehabilitation treatment can provide a high level of support (i.e. up to 24 hours a day) and tends towards a medium to longer-term duration. Rehabilitation activities can occur in residential or non-residential settings. Counselling that is included within an overall rehabilitation program should be coded to Code 3 for Rehabilitation, not to Code 2 as a separate treatment episode for counselling.

CODE 4 Pharmacotherapy

Refers to pharmacotherapies that include those used as maintenance therapies (e.g. naltrexone, buprenorphine, and methadone treatment) and those used as relapse prevention. Use Code 1 (withdrawal management) where a pharmacotherapy is used solely for withdrawal. Note collection exclusions: excludes treatment episodes for clients who are on an opioid pharmacotherapy maintenance program and are not receiving any other form of treatment.

CODE 5 Support and case management only

Refers to when there is no treatment provided to the client other than support and case management (e.g. treatment provided through youth alcohol and drug outreach services). This choice only applies where support and case management treatment is recorded as individual client data and the treatment activity is not included in any other category.

CODE 6 Information and education only

Refers to when there is no treatment provided to the client other than information and education. It is noted that, in general, service contacts would include a component of information and education.

CODE 7 Assessment only

Refers to when there is no treatment provided to the client other than assessment. It is noted that, in general, service contacts would include an assessment component.

Data element attributes

Collection and usage attributes

Guide for use: Only one code to be selected.

To be completed at assessment or commencement of treatment.

The main treatment type is the principal activity as judged by the treatment provider that is necessary for the completion of the treatment plan for the principal drug of concern. The main treatment type for alcohol and other drugs is the principal focus of a single treatment episode. Consequently, each treatment episode will only have one main treatment type.

For brief interventions, the main treatment type may apply to as few as one contact between the client and agency staff.

Comments: Information about treatment provided is of fundamental importance to service delivery and planning.

Major diagnostic category

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care—major diagnostic category, code (AR-DRG v 6) NN
METeOR identifier:	391298
Registration status:	Health, Standard 22/12/2009 Tasmanian Health, Proposed 28/09/2011
Definition:	The category into which the patient's diagnosis and the associated Australian refined diagnosis related group (ARDG) falls, as represented by a code.
Data Element Concept:	Episode of admitted patient care—major diagnostic category

Value domain attributes

Representational attributes

Classification scheme:	Australian Refined Diagnosis Related Groups version 6
Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Data element attributes

Collection and usage attributes

Comments:	This metadata item has been created to reflect the development of Australian refined diagnosis related groups (AR-DRGs) (as defined in the metadata item Episode of admitted patient care—diagnosis related group, code (AR-DRG v 6) ANNA) by the Commonwealth Department of Health and Ageing. Due to the modifications in the diagnosis related group logic for the AR-DRGs, it is necessary to generate the major diagnostic category to accompany each diagnosis related group. The construction of the pre-major diagnostic category logic means diagnosis related groups are no longer unique. Certain pre-major diagnostic category diagnosis related groups may occur in more than one of the 23 major diagnostic categories.

Marital status

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—marital status, code N

METeOR identifier: 291045

Registration status: Community Services, Standard 25/08/2005
Housing assistance, Standard 10/02/2006
Health, Standard 04/05/2005

Definition: A person's current relationship status in terms of a couple relationship or, for those not in a couple relationship, the existence of a current or previous registered marriage, as represented by a code.

Data Element Concept: Person—marital status

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Never married
	2	Widowed
	3	Divorced
	4	Separated
	5	Married (registered and de facto)
Supplementary values:	6	Not stated/inadequately described

Collection and usage attributes

Guide for use: Refers to the current marital status of a person.

CODE 2 Widowed

This code usually refers to registered marriages but when self reported may also refer to de facto marriages.

CODE 4 Separated

This code refers to registered marriages but when self reported may also refer to de facto marriages.

CODE 5 Married (registered and de facto)

Includes people who have been divorced or widowed but have since re-married, and should be generally accepted as applicable to all de facto couples, including of the same sex.

CODE 6 Not stated/inadequately described

This code is not for use on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Source and reference attributes

Origin:

The ABS standards for the collection of Social and Registered marital status appear on the ABS Website. Australian Bureau of Statistics. Family, household and income unit variables. Cat. no. 1286.0. Canberra: ABS.

Data element attributes

Collection and usage attributes

Collection methods:

This metadata item collects information on social marital status. The recommended question module is:

Do you/Does the person usually live with a partner in a registered or de facto marriage?

Yes, in a registered marriage

Yes, in a de facto marriage

No, never married

No, separated

No, divorced

No, widowed

It should be noted that information on marital status is collected differently by the ABS, using a set of questions. However, the question outlined above is suitable and mostly sufficient for use within the health and community services fields. See Source document for information on how to access the ABS standards.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, the recommended question should be used wherever practically possible.

Comments:

The ABS standards identify two concepts of marital status:

- Registered marital status - defined as whether a person has, or has had, a registered marriage;
- Social marital status - based on a person's living arrangement (including de facto marriages), as reported by the person.

It is recommended that the social marital status concept be collected when information on social support/home arrangements is sought, whereas the registered marital status concept need only be collected where it is specifically required for the purposes of the collection.

While marital status is an important factor in assessing the type and extent of support needs, such as for the elderly living in the home environment, marital status does not adequately address the need for information about social support and living arrangement and other data elements need to be formulated to capture this information.

MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator, yes/no code N

METeOR identifier: 441371

Registration status: Health, Standard 07/12/2011

Definition: An indicator of whether a person has received a Medicare Benefits Schedule (MBS) Health Assessment for Aboriginal and Torres Strait Islander People (Item 715), as represented by a code.

Data Element Concept: Person—MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Boolean

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes

A person has received an MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715).

CODE 2 No

A person has not received an MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715).

Comments: The MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) is used to ensure that Aboriginal and Torres Strait Islander people receive primary health care matched to their needs, by encouraging early detection, diagnosis and intervention for common and treatable conditions that cause morbidity and early mortality. The health assessment includes an assessment of the patient's health, including their physical, psychological and social wellbeing. It also assesses what preventive health care, education and other assistance should be offered to the patient to improve their health and wellbeing.

Medical indemnity payment recipient

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Medical indemnity claim management episode—medical indemnity payment recipient type, code N
METeOR identifier:	421927
Registration status:	Health, Standard 07/12/2011
Definition:	The recipient of a damages payment arising from a medical indemnity claim, as represented by a code.
Data Element Concept:	Medical indemnity claim management episode—medical indemnity payment recipient type

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	2	Payment to patient only
	3	Payment to other party/parties only
	4	Payment to patient and other party/parties
Supplementary values:	7	Not applicable—no payment to claimant
	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

The claimant is the person who is pursuing a medical indemnity claim and may be the patient or some other party claiming for harm or loss allegedly resulting from the health-care incident that gave rise to the medical indemnity claim.

CODE 7 Not applicable—no payment to claimant

'Not applicable—no payment to claimant' should be used where no payment was made to the claimant; for example, if legal or investigative costs have been paid, but there has been no payment of damages.

CODE 9 Not stated/inadequately described

'Not stated/inadequately described' should be used when the information is not currently available.

Medical indemnity claim commencement date

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Medical indemnity claim—medical indemnity claim commencement date, DDMMYYYY

METeOR identifier: 329623

Registration status: Health, Standard 07/12/2011

Definition: The date on which a medical indemnity claim commenced, as signalled by a trigger such as the issue of a letter of demand, issue of writ, or an offer made by the defendant to the claimant, expressed as DDMMYYYY.

Data Element Concept: Medical indemnity claim—medical indemnity claim commencement date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: The date recorded should be the date of the first trigger. For example, if a letter of demand is received and subsequently a writ is issued, the date recorded for this metadata item should be the date of the letter of demand.

The date the medical indemnity claim commenced must be a date that is the same as or after the date the health-care incident occurred. It may be a date before or after the date the reserve was placed.

A trigger for the commencement of a medical indemnity claim is any event that distinguishes the claim from potential claims, which have had a reserve set but may be based on no more information than a health-care incident report. Common triggers are allegations of harm or other loss from the patient or another party related to the patient, and offers of compensation by the defendant before an allegation of harm or other loss has been received.

This data element should be used in conjunction with the data element: *Date—accuracy indicator, code AAA* to flag whether each component in the claim commencement date is accurate, estimated or unknown.

Comments: Date information will assist in the analysis of temporal patterns in the Medical Indemnity National Collection.

A claim commencement trigger is not sufficient for a medical indemnity claim to be recognised. The critical event is the setting of a reserve which marks the health authority's recognition of the likelihood that costs will be incurred in finalising the claim. However, if a claim commencement trigger precedes when the reserve is set, than the claim will come into existence as a commenced, not a potential claim.

Collection and usage attributes

Guide for use:	The medical indemnity claim finalisation date is the date on which a medical indemnity claim was settled, a final court decision was delivered, or the claim file was closed (whichever occurred first). This data element must remain blank if the medical indemnity claim has not yet been closed or a structured settlement is not yet agreed. However, it must be recorded if a medical indemnity claim is closed. This data element should be used in conjunction with the data element: *Date—accuracy indicator, code AAA* to flag whether each component in the date is accurate, estimated or unknown.
Comments:	This data item is collected by the Australian Prudential Regulation Authority (2006) as part of their National Claims and Policies Database.

10	$5 million or more

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Steward:	Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use: The health authority may adjust its reserve based on information that comes to hand subsequent to when the reserve was initially set, and/or based on expenses that are incurred prior to the finalisation of the claim. The amount recorded should reflect the current **reserve** against the medical indemnity claim at the end of the relevant financial year.

Comments: Insurance Statistics Australia produces a reserve estimate for current medical indemnity claims, by combining its National Claims and Policies Database (APRA 2006) data items 20 'Gross payments to date' and 22 'Gross case estimate at end of reporting period'. Addition of these two dollar amounts produces the reserve estimate, which can be mapped to the Medical Indemnity National Collection ranges (AIHW 2011).

9	$2 million to less than $5 million
10	$5 million or more

Supplementary values:

99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 0 $0

'$0' should only be used where the medical indemnity claim has been closed and no payment has been or is to be made to the claimant and there have been no claimant or defence investigative or legal costs. If no payment was made to the claimant but investigative or legal costs were incurred then the appropriate dollar range should be selected.

CODE 99 Not stated/inadequately described

'Not stated/inadequately described' should be used for medical indemnity claims that have not yet been closed, where a structured settlement has not yet been agreed or for finalised claims when information on total claim size is not yet available.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use: The total claim size is the total amount paid to the patient or some other party claiming for harm or other loss allegedly resulting from health care in settlement of the matter, including any interim payments and claimant legal costs, plus defence investigative and legal costs. The amount should not include internal claim management costs. Total claim size should reflect costs paid (or agreed to be paid) by the health authority only; any third party contributions (for example payments from medical indemnity insurers) should be excluded.

Medical indemnity claim status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Medical indemnity claim—medical indemnity claim status, code NN
METeOR identifier:	329644
Registration status:	Health, Standard 07/12/2011
Definition:	The status of a medical indemnity claim in terms of the stage it has reached in the claims management process from a reserve being set to file closure, as represented by a code.
Data Element Concept:	Medical indemnity claim—medical indemnity claim status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
10	Not yet commenced, claim file open
11	Not yet commenced, claim file closed
20	Commenced, claim file open
30	Commenced, claim file closed
32	Structured settlement, claim file open
33	Structured settlement, claim file closed
40	Claim previously closed, now reopened
50	Claim record rescinded, not a medical indemnity claim

Collection and usage attributes

Guide for use:

CODE 10 Not yet commenced, claim file open

‘Not yet commenced, claim file open’ indicates that a reserve has been set for the medical indemnity claim but none of the events signalling claim commencement have yet occurred and the claim remains open.

CODE 11 Not yet commenced, claim file closed

‘Not yet commenced, claim file closed’ indicates that a reserve has been set for the medical indemnity claim but none of the events signalling claim commencement have occurred, so the claim has been finalised as a discontinued potential claim.

CODE 20 Commenced, claim file open

'Commenced, claim file open' indicates that the medical indemnity claim has commenced and remains open.

CODE 30 Commenced, claim file closed

'Commenced, claim file closed' indicates that the medical indemnity claim has commenced and has been closed.

CODE 32 Structured settlement, claim file open

'Structured settlement, claim file open' indicates where a decision on a structured settlement has been reached but the medical indemnity claim file remains open.

CODE 33 Structured settlement, claim file closed

'Structured settlement, claim file closed' indicates where the medical indemnity claim was subject to a structured settlement and the medical indemnity claim file has been closed.

CODE 40 Claim previously closed, now reopened

'Claim previously closed, now reopened' indicates instances where a medical indemnity claim previously recorded as finalised on the Medical Indemnity National Collection (Public Sector) database has been reopened.

CODE 50 Claim record rescinded, not a medical indemnity claim

'Claim record rescinded, not a medical indemnity claim' indicates when the health authority determines that a record previously transmitted to the Australian Institute of Health and Welfare (the National Data Custodian) is not a medical indemnity claim but is another type of claim, a duplicate record with a different claim identifier, or the record of a health-care incident construed as a potential claim but on insufficient justification.

Medicare card number

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—government funding identifier, Medicare card number N(11)
METeOR identifier:	270101
Registration status:	Community Services, Recorded 27/03/2007 Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	Person identifier, allocated by the Health Insurance Commission to eligible persons under the Medicare scheme, that appears on a Medicare card.
Context:	Medicare utilisation statistics. Persons eligible for Medicare services.
Data Element Concept:	Person—government funding identifier

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	Number
Format:	N(11)
Maximum character length:	11

Collection and usage attributes

Guide for use:	Full Medicare number for an individual (i.e. family number plus person (individual reference) number).
Comments:	The Medicare card number is printed on a Medicare card and is used to access Medicare records for an eligible person. Up to 9 persons can be included under the one Medicare card number with up to five persons appearing on one physical card. Persons grouped under one Medicare card number are often a family, however, there is no requirement for persons under the same Medicare card number to be related. A person may be shown under separate Medicare card numbers where, for example, a child needs to be included on separate Medicare cards held by their parents. As a person can be identified on more than one Medicare card this is not a unique identifier for a person.

Data element attributes

Collection and usage attributes

Guide for use: The Medicare card number should only be collected from persons eligible to receive health services that are to be funded by the Commonwealth government. The number should be reported to the appropriate government agency to reconcile payment for the service provided. The data should not be used by private sector organisations for any other purpose unless specifically authorised by law. For example, data linkage should not be carried out unless specifically authorised by law.

Comments: Note: Veterans may have a Medicare card number and a Department of Veterans' Affairs (DVA) number or only a DVA number.

	1	Eligible
	2	Not eligible
Supplementary values:	9	Not stated/unknown

Data element attributes

Collection and usage attributes

Guide for use:

Eligible persons are

- Permanent residents of Australia
- Persons who have an application for permanent residence (not an aged parent visa), and have either:

- a spouse, parent or child who is an Australian citizen or permanent resident, OR

- authority from Department of Immigration and Multicultural and Indigenous Affairs to work

- Foreign spouses of Australian residents:

- must have an application for permanent residence, as above

- Asylum seekers who have been issued with valid temporary visas. The list of visas is subject to changes which may be applied by the Department of Immigration and Multicultural Affairs.
- American Fulbright scholars studying in Australia (but not their dependents)
- Diplomats and their dependants from reciprocal health countries (excluding New Zealand and Norway) have full access to Medicare without the restrictions for American Fulbright scholars.

Reciprocal health care agreements

Residents of countries with whom Australia has Reciprocal health care agreements are also eligible under certain circumstances. Australia has Reciprocal Health Care Agreements with Ireland, Italy, Finland, Malta, the Netherlands, New Zealand, Norway, Sweden and the United Kingdom. These Agreements give visitors from these countries access to Medicare and the Pharmaceutical Benefits Scheme for the treatment of an illness or injury which occurs during their stay, and which requires treatment before returning home (that is, these Agreements cover immediately necessary medical treatment, elective treatment is not covered). The Agreements provide for free accommodation and treatment as public hospital services, but do not cover treatment as a private patient in any kind of hospital.

– The Agreements with Finland, Italy, Malta, the Netherlands, Norway, Sweden and the United Kingdom provide free care as a public patient in public hospitals, subsidised out-of-hospital medical treatment under Medicare, and subsidised medicines under the Pharmaceutical Benefits Scheme.

– The Agreements with New Zealand and Ireland provide free care as a public patient in public hospitals and subsidised medicines under the Pharmaceutical Benefits Scheme, but do not cover out-of-hospital medical treatment.

– Visitors from Italy and Malta are covered for a period of six months from the date of arrival in Australia only.

Eligible patients may elect to be treated as either a public or a private patient.

A newborn will usually take the Medicare eligibility status of the mother. However, the eligibility status of the father will be applied to the newborn if the baby is not eligible solely by virtue of the eligibility status of the mother.

For example, if the mother of a newborn is an ineligible person but the father is eligible for Medicare, then the newborn will be eligible for Medicare.

Not eligible/ineligible: means any person who is not Medicare eligible. Ineligible patients may not elect to be treated as a public patient.

Prisoners are ineligible for Medicare, under Section 19 (2) of the Health Insurance Act 1973.

Collection methods:

In practice, the primary method for ascertaining Medicare eligibility status is undertaken by the healthcare organisation sighting the patient's Medicare card.

Mental health legal status

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—mental health legal status, code N

METeOR identifier: 459215

Registration status: Health, Standard 07/12/2011

Definition: Whether a person is treated on an involuntary basis under the relevant state or territory mental health legislation, at any time during an episode of admitted patient care, an episode of residential care or treatment of a patient/client by a community based service during a reporting period, as represented by a code.

Data Element Concept: Episode of care—mental health legal status

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Involuntary patient
	2	Voluntary patient
Supplementary values:	9	Not reported/unknown

Collection and usage attributes

Guide for use: CODE 1 Involuntary patient

Involuntary patient should only be used by facilities which are approved for this purpose. While each state and territory mental health legislation differs in the number of categories of involuntary patient that are recognised, and the specific titles and legal conditions applying to each type, the legal status categories which provide for compulsory detention or compulsory treatment of the patient can be readily differentiated within each jurisdiction. These include special categories for forensic patients who are charged with or convicted of some form of criminal activity. Each state/territory health authority should identify which sections of their mental health legislation provide for detention or compulsory treatment of the patient and code these as involuntary status.

CODE 2 Voluntary patient

Voluntary patient to be used for reporting to the NMDS-Community mental health care, where applicable.

CODE 9 Not reported/unknown

This code is to be used if the mental health legal status for the patient is either not reported or unknown.

Data element attributes

Collection and usage attributes

Guide for use:

The mental health legal status of admitted patients treated within approved hospitals may change many times throughout the episode of care.

Patients may be admitted to hospital on an involuntary basis and subsequently be changed to voluntary status; some patients are admitted as voluntary but are transferred to involuntary status during the hospital stay. Multiple changes between voluntary and involuntary status during an episode of care in hospital or treatment in the community may occur depending on the patient's clinical condition and his/her capacity to consent to treatment.

Similarly, the mental health legal status of residents treated within residential care services may change on multiple occasions throughout the episode of residential care or residential stay.

Collection methods:

Admitted patients to be reported as involuntary if the patient is involuntary at any time during the episode of care.

Residents in **residential mental health services** to be reported as involuntary if the resident is involuntary at any time during the episode of residential care.

Patients of ambulatory mental health care services to be reported as involuntary if the patient is involuntary at the time of a service contact.

Metadata item type: Data Element

Technical name: Mental health service contact—service contact duration, total minutes NNN

METeOR identifier: 286682

Registration status: Health, Standard 08/12/2004

Definition: The time from the start to finish of a service contact.

Data Element Concept: Mental health service contact—mental health service contact duration

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NNN

Maximum character length: 3

Data element attributes

Collection and usage attributes

Guide for use: For group sessions the time for the patient/client in the session is recorded for each patient/client, regardless of the number of patients/clients or third parties participating or the number of service providers providing the service.

Writing up details of service contacts is not to be reported as part of the duration, except if during or contiguous with the period of patient/client or third party participation.

Travel to or from the location at which the service is provided, for example to or from outreach facilities or private homes, is not to be reported as part of the duration of the service contact.

Comments: Counting the duration for each patient/client in a group session means that this data element cannot be used to measure the duration of service contacts from the perspective of the service provider.

Guide for use:

Service contacts are not restricted to in-person communication but can include telephone, video link or other forms of direct communication.

- Code 1 is to be used for service contacts between a specialised mental health service provider and the patient/client in whose clinical record the service contact would normally warrant a dated entry, where the patient/client is participating.
- Code 2 is to be used for service contacts between a specialised mental health service provider and a third party(ies) where the patient/client, in whose clinical record the service contact would normally warrant a dated entry, is not participating.

Mental health service contact—session type

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Mental health service contact—session type, code N

METeOR identifier: 286832

Registration status: Health, Standard 08/12/2004

Definition: Whether a service contact is provided for one or more patient(s)/client(s), as represented by a code.

Data Element Concept: Mental health service contact—session type

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Individual session
2	Group session

Data element attributes

Collection and usage attributes

Guide for use: A service contact is regarded as an individual session where the service is provided for one patient/client with or without third party involvement.

A service contact is regarded as a group session where two or more patients/clients are participating in the service contact with or without third parties and the nature of the service would normally warrant dated entries in the clinical records of the patients/clients in question.

A service contact is also regarded as a group session where third parties for two or more patients/clients are participating in the service contact without the respective patients/clients and the nature of the service would normally warrant dated entries in the clinical records of the patients/clients in question.

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Comments: At the prison reception assessment, prison entrants may be referred to prison mental health services for observation and further assessment. Prison mental health services provide access to specialist mental health nurses, psychiatrists, psychologists and in-patient services where the prisoners receive counselling and intervention programs.

Under the *National Action Plan on Mental Health 2006-2011* (COAG 2006) jurisdictions are required to provide details on the prevalence of mental illness among people who are newly sentenced to prison and enhance mental health services for people in contact with the justice system.

Microalbumin level—albumin/creatinine ratio (measured)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—microalbumin level (measured), albumin/creatinine ratio N[NN].N
METeOR identifier:	270339
Registration status:	Health, Standard 01/03/2005
Definition:	A person's microalbumin level, measured as an albumin/creatinine ratio.
Data Element Concept:	Person—microalbumin level

Value domain attributes

Representational attributes

Representation class:	Ratio	
Data type:	Number	
Format:	N[NN].N	
Maximum character length:	4	
Supplementary values:	Value	Meaning
	999.9	Not stated/inadequately described
Unit of measure:	Milligram per millimole (mg/mmol)	
Unit of measure precision:	1	

Data element attributes

Collection and usage attributes

Collection methods:

Measurement of microalbumin levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authority.

Microalbumin is not detected by reagent strips for urinary proteins, and requires immunoassay.

As urinary albumin varies with posture and exercise it is important to collect the urine under very standard conditions; short-term (2 hours) during rest, overnight (approximately 8 hours) or an early morning sample. For screening purposes an early morning urine specimen is adequate, and if the albumin/creatinine ratio is found to be greater than 3.5 mg/mmol then a timed overnight sample should be obtained for estimation of the albumin excretion rate.

Test for albuminuria by measuring microalbumin in timed or first morning urine sample.

The results considered elevated are

- spot urine 30 to 300 mg/L; or
- timed urine (24 hour collection) 20 to 200 µg/min.

CODE 2 Statistical admission - episode type change

Use this code where a new episode of care is commenced within the same hospital stay.

CODE 3 Other

Use this code for all planned admissions and unplanned admissions (except transfers into the hospital from another hospital).

Mode of medical indemnity claim finalisation

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Medical indemnity claim—medical indemnity claim finalisation mode, code N[N]
METeOR identifier:	330111
Registration status:	Health, Standard 07/12/2011
Definition:	The process by which a medical indemnity claim was finalised, as represented by a code.
Data Element Concept:	Medical indemnity claim—medical indemnity claim finalisation mode

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N[N]	
Maximum character length:	2	
Permissible values:	Value	Meaning
	1	Settled through state or territory-based complaints processes
	2	Settled through court-based alternative dispute resolution processes
	3	Settled through statutorily mandated compulsory conference process
	4	Settled—other
	5	Court decision
	8	Discontinued commenced claim
	9	Discontinued potential claim
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Settled through state or territory-based complaints processes

'Settled through state or territory-based complaints processes' includes proceedings conducted in state or territory health rights and health complaints bodies.

CODE 2 Settled through court-based alternative dispute resolution processes

‘Settled through court-based alternative dispute resolution processes’ includes mediation, arbitration, and case appraisal provided for under civil procedure rules.

CODE 3 Settled through statutorily mandated compulsory conference process

‘Settled through statutorily mandated compulsory conference process’ includes settlement conferences required by statute as part of a pre-court process.

CODE 4 Settled—other

‘Settled—other’ includes instances where a medical indemnity claim is settled part way through a trial or a negotiated settlement.

CODE 8 Discontinued commenced claim

‘Discontinued commenced claim’ means the discontinued medical indemnity claim has already commenced and now has the status of ‘Commenced—claim file closed’.

Discontinued medical indemnity claims include claims which have been closed due to withdrawal by the claimant, or operation of statute of limitations, or particularly with potential claims where the claim manager decides to close the claim file because there has been a long period of inactivity on the matter. Discontinued medical indemnity claims also include instances where a commenced claim is discontinued part way through a trial.

CODE 9 Discontinued potential claim

‘Discontinued potential claim’ means the discontinued medical indemnity claim has not yet commenced and now has the status of ‘Not yet commenced—claim file closed’.

CODE 99 Not stated/inadequately described

‘Not stated/inadequately described’ should be used for medical indemnity claims that have not yet been closed or a structured settlement has not yet been agreed.

Comments: Code 5, ‘Court decision’, in this value domain maps to Code V, ‘Case was settled by court judgement’, in the Australian Prudential Regulation Authority National Claims and Policies Database ‘Litigation status’ data item (APRA 2006).

1	Discharge/transfer to (an)other acute hospital
2	Discharge/transfer to a residential aged care service, unless this is the usual place of residence
3	Discharge/transfer to (an)other psychiatric hospital
4	Discharge/transfer to other health care accommodation (includes mothercraft hospitals)
5	Statistical discharge - type change
6	Left against medical advice/discharge at own risk
7	Statistical discharge from leave
8	Died
9	Other (includes discharge to usual residence, own accommodation/welfare institution (includes prisons, hostels and group homes providing primarily welfare services))

Collection and usage attributes

Guide for use:

CODE 4 Discharge/transfer to other health care accommodation (includes mothercraft hospitals)

In jurisdictions where mothercraft facilities are considered to be acute hospitals, patients separated to a mothercraft facility should have a mode of separation of Code 1. If the residential aged care service is the patient's place of usual residence then they should have a mode of separation of Code 9.

Morphology of cancer

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—morphology of cancer, code (ICD-O-3) NNNN/N

METeOR identifier: 399491

Registration status: Health, Standard 07/12/2011

Definition: The histological classification of the cancer tissue (histopathological type) in a person with cancer, and a description of the course of development that a tumour is likely to take: benign or malignant (behaviour), as represented by a code.

Data Element Concept: Person with cancer—morphology of cancer

Value domain attributes

Representational attributes

Classification scheme: International Classification of Diseases for Oncology 3rd edition

Representation class: Code

Data type: Number

Format: NNNN/N

Maximum character length: 5

Collection and usage attributes

Guide for use: ICD-O morphology describes histology and behaviour as separate variables, recognising that there are a large number of possible combinations.

In ICD-O, morphology is a 4-digit number ranging from 8000 to 9989, and behaviour is a single digit which can be 0, 1, 2, 3, 6 or 9.

When the morphology is unknown, record 8000 and the appropriate behaviour code. For example, a tumour of unknown morphology with a behaviour code of "3" for a malignant primary site tumour would be recorded as 8000/3.

Source and reference attributes

Origin: International Classification of Diseases for Oncology, Third Edition (ICD-O-3)

Data element attributes

Collection and usage attributes

Guide for use:

Tumour morphology refers to the type of cell (histology) that has become neoplastic and its biologic activity (behaviour).

Record the tumour morphology for patients who have been diagnosed with cancer.

Record the tumour morphology relating to the initial diagnosis and not for recurrent disease.

Record morphology codes in accordance with ICD-O-3 coding standards. Use the 5th-digit to record behaviour. Refer to the coding guidelines for morphology in ICD-O-3, pp 27-34.

If the morphology differs on multiple pathology reports for the same tumour, use the value from the most representative tumour specimen examined. For example, if the tumour is described as ductal on core biopsy but undifferentiated carcinoma on the excision specimen, the morphology would be coded as undifferentiated carcinoma (a lower code) which has a less favourable diagnosis.

Collection methods:

This information should be obtained from the patient's pathology reports or, in the case of cancer registries, from the notification reports.

Comments:

The information is collected so that tumours can be classified into clinically relevant groups based on their primary site and morphology. This provides a basis for staging and the determination of treatment options. The morphology of the cancer also affects the course of the disease and prognosis.

Value	Meaning
1	Mostly community-based setting
2	Mostly inpatient setting
3	Similar proportion in both settings

Collection and usage attributes

Collection methods: Record only one code.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Mostly community based setting

During the past 12 months, more than 60% of service delivery time was estimated to have been spent on delivering services to, and on behalf of, clients in community settings. This includes residential settings such as private residences (including caravans, mobile homes, houseboats or units in a retirement village), residential aged care facilities, prisons, and community living environments (including group homes); and non-residential settings such as day respite centres or day centres. It includes hospital outreach services and outpatient settings where these are delivered in the community setting.

CODE 2 Mostly inpatient setting

During the past 12 months, more than 60% of service delivery time was estimated to have been spent on delivering services to, and on behalf of, clients in inpatient settings. This includes hospitals, hospices or admitted patient settings. It excludes services delivered in outpatient settings and hospital outreach services delivered in the community setting.

CODE 3 Similar level in both settings

During the past 12 months, a similar proportion of service delivery time (between 40-60%) was estimated to have been spent on delivering services in community and inpatient settings.

Collection methods: Record only one code.

Registration status:	Health, Standard 07/12/2011
Definition:	The most valid basis of diagnosis in a person with cancer, as represented by a code.
Data Element Concept:	Person with cancer—most valid basis of diagnosis of a cancer

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
0	Death certificate only: Information provided is from a death certificate
1	Clinical: Diagnosis made before death, but without any of the following (codes 2-7)
2	Clinical investigation: All diagnostic techniques, including x-ray, endoscopy, imaging, ultrasound, exploratory surgery (e.g. laparotomy), and autopsy, without a tissue diagnosis
4	Specific tumour markers: Including biochemical and/or immunological markers that are specific for a tumour site
5	Cytology: Examination of cells from a primary or secondary site, including fluids aspirated by endoscopy or needle; also includes the microscopic examination of peripheral blood and bone marrow aspirates
6	Histology of metastasis: Histological examination of tissue from a metastasis, including autopsy specimens
7	Histology of a primary tumour: Histological

		examination of tissue from primary tumour, however obtained, including all cutting techniques and bone marrow biopsies; also includes autopsy specimens of primary tumour
	8	Histology: either unknown whether of primary or metastatic site, or not otherwise specified
Supplementary values:	9	Unknown.

Collection and usage attributes

Guide for use: CODES 1 - 4

Non-microscopic.

CODES 5 - 8

Microscopic.

CODE 9

Other.

Comments: In a hospital setting this metadata item should be collected on the most valid basis of diagnosis at this admission. If more than one diagnosis technique is used during an admission, select the higher code from 1 to 8.

Data element attributes

Collection and usage attributes

Guide for use: The most valid basis of diagnosis may be the initial histological examination of the primary site, or it may be the post-mortem examination (sometimes corrected even at this point when histological results become available). In a cancer registry setting, this metadata item should be revised if later information allows its upgrading.

When considering the most valid basis of diagnosis, the minimum requirement of a cancer registry is differentiation between neoplasms that are verified microscopically and those that are not. To exclude the latter group means losing valuable information; the feasibility of making a morphological (histological) diagnosis is dependent upon a variety of factors, such as the health and age of the patient, accessibility of the tumour, availability of medical services, and the beliefs and decisions of the patient.

A biopsy of the primary tumour should be distinguished from a biopsy of a metastasis, for example, at laparotomy; a biopsy of cancer of the head of the pancreas versus a biopsy of a metastasis in the mesentery. However, when insufficient information is available, Code 8 should be used for any histological diagnosis. Cytological and histological diagnoses should be distinguished.

Morphological confirmation of the clinical diagnosis of malignancy depends on the successful removal of a piece of tissue that is cancerous. Especially when using endoscopic procedures (bronchoscopy, gastroscopy, laparoscopy, etc.), the clinician may miss the tumour with the biopsy forceps. These cases must be registered on the basis of endoscopic diagnosis and not excluded through lack of a morphological diagnosis.

Care must be taken in the interpretation and subsequent coding of autopsy findings, which may vary as follows:

a) the post-mortem report includes the post-mortem histological diagnosis (in which case, one of the histology codes should be recorded instead);

b) the autopsy is macroscopic only, histological investigations having been carried out only during life (in which case, one of the histology codes should be recorded instead);

c) the autopsy findings are not supported by any histological diagnosis.

Comments: Knowledge of the basis of the diagnosis underlying a cancer code is one of the most important elements in assessing the reliability of cancer statistics.

Collection and usage attributes

Guide for use:

CODES 1 - 4

Non-microscopic.

CODES 5 - 8

Microscopic.

CODE 9

Other.

Comments:

In a hospital setting this metadata item should be collected on the most valid basis of diagnosis at this admission. If more than one diagnosis technique is used during an admission, select the higher code from 1 to 8.

Data element attributes

Collection and usage attributes

Guide for use:

Record the most valid basis of diagnosis that identifies the first recurrence of locoregional cancer or a distant metastasis.

The term recurrence refers to the return, reappearance or metastasis of cancer of the same histology after a disease-free period. It may be locoregional or a distant metastasis.

The information is collected for the first recurrence of cancer at any site.

The coding system is based on that recommended by the International Agency for Research on Cancer (IARC) and the International Association of Cancer Registries (IACR). The value "3" is not represented.

If more than one investigation identifying the recurrence is conducted at the same time, select the higher number code from 1 to 8 reflecting the most definitive method of diagnosis. For example, if the patient has both imaging (Code 2) and histology of a primary tumour (Code 7) to verify the cancer, record Code 7 as the most valid basis of diagnosis.

When considering the most valid basis of diagnosis, the minimum requirement of a cancer registry is differentiation between neoplasms that are verified microscopically and those that are not. To exclude the latter group means losing valuable information; the feasibility of making a morphological (histological) diagnosis is dependent upon a variety of factors, such as the health and age of the patient, accessibility of the tumour, availability of medical services, and the beliefs and decisions of the patient.

A biopsy of the primary tumour should be distinguished from a biopsy of a metastasis, for example, at laparotomy; a biopsy of cancer of the head of the pancreas versus a biopsy of a metastasis in the mesentery. However, when insufficient information is available to determine whether the site of the biopsy is primary or metastatic, Code 8. Cytological and histological diagnoses should also be distinguished.

Morphological confirmation of the clinical diagnosis of malignancy depends on the successful removal of a piece of tissue that is cancerous. When using endoscopic procedures such as bronchoscopy, gastroscopy or laparoscopy, the clinician may miss the tumour with the biopsy forceps. These cases must be registered on the basis of endoscopic diagnosis and not excluded through lack of a morphological diagnosis.

Care must be taken in the interpretation and subsequent coding of autopsy findings, which may vary as follows:

(a) The post-mortem report includes the post-mortem histological diagnosis (in which case, one of the histology codes should be recorded instead);

(b) The autopsy is macroscopic only, histological investigations having been carried out only during life (in which case, one of the histology codes should be recorded instead);

(c) The autopsy findings are not supported by any histological diagnosis.

Collection methods: The information should be obtained from the patient’s medical record.

Comments: Information regarding the basis of diagnosis is important for determining how definitively the malignancy was confirmed and subsequently the reliability of cancer statistics.

Data element attributes

Collection and usage attributes

Guide for use:

A single Person name may have multiple Name conditional use flags associated with it. Record as many as applicable.

CODE 1 Unreliable information: should be used where it is known that the name recorded is a fictitious or partial name. These names should not be used for matching client data.

CODE 2 Name not for continued use, indicates that this name should NOT be used when referring to this person. The name is retained for identification purposes only. For Aboriginal and Torres Strait Islanders, certain tribal names may become 'not for continued use' due to the death of a relative.

CODE 3 Special privacy/security requirements– may apply to names for which episodes are attached that should only be accessible to specified authorised persons. There must be a specific need to implement this additional security level. Local policy should provide guidance to the use of this code.

Maximum character length:	1

Permissible values:

Value	Meaning
1	Preferred name
2	Medicare name
3	Newborn name
4	Alias name

Data element attributes

Collection and usage attributes

Guide for use:

A person may have more than one name that they use. At least one name must be recorded for each person. Each name recorded must have one or more appropriate Person name type associated with it. Record all that are required.

One name is sufficient; however, where the person offers more than one name, clarification should be obtained from the person to ensure accurate identification of the person and recording of the various names. The currently used name, as well as names by which the person has previously been known, should be recorded if these are known.

Field value definitions for Person name type codes are:

CODE 1 Preferred name is the name by which the person chooses to be identified.
There should only be one preferred name recorded for a

person. Where the person changes their preferred name, record the previously recorded preferred name as an Alias name. Preferred name is the default name type (i.e. if only one name is recorded it should be the person's preferred name). There must be a preferred name recorded except for unnamed newborns where the newborn name is the only name recorded.

Also, if the person is a health care client, record his/her Medicare card name if different to the preferred name, and any known alias names.

CODE 2 Medicare name for a health care client, this is the person's name as it appears on their Medicare card. The name stated on the Medicare card is required for all electronic Medicare claim lodgement. If the preferred name of the person is different to the name on the Medicare card, the Medicare card name should also be recorded. For an individual health care provider, this is the person's name registered by Medicare (Health Insurance Commission).

CODE 3 Newborn name: type is reserved for the identification of unnamed newborn babies.

CODE 4 Alias name is any other name that a person is also known by, or has been known by in the past; that is, all alias names. This includes misspelt names or name variations that are to be retained as they have been used to identify this person. More than one alias name may be recorded for a person.

	8	Other
Supplementary values:	9	Unknown

Collection and usage attributes

Guide for use:

CODE 1 Organisation unit/section/division

This code is used where a business unit, section or division within an organisation may have its own separate identity.

CODE 2 Service location name

This code is used where the service location name is an important part of the organisation name and is used for identification purposes, e.g. Mobile Immunisation Unit at Bankstown.

CODE 3 Business name

Business name used only for trading purposes.

CODE 4 Locally used name

This code is used where a local name is used, e.g. where a medical practice is known by a name that is different to the company registration name or business name.

CODE 5 Abbreviated name

A short name or an abbreviated name by which the organisation is known, e.g. HIC.

CODE 6 Enterprise name

Generally, the complete organisation name should be used to avoid any ambiguity in identification. This should usually be the same as company registration name.

CODE 8 Other

This code is used when the organisation name does not fit into any one of the categories listed above.

CODE 9 Unknown

This code is used when the organisation name type is unknown.

Data element attributes

Narrative description of injury event

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Injury event—external cause, text [X(100)]

METeOR identifier: 268946

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: A textual description of the environmental event, circumstance or condition as the cause of injury, poisoning and other adverse effect.

Data Element Concept: Injury event—external cause

Value domain attributes

Representational attributes

Representation class: Text

Data type: String

Format: [X(100)]

Maximum character length: 100

Data element attributes

Collection and usage attributes

Guide for use: Write a brief description of how the injury occurred. It should indicate what went wrong (the breakdown event); the mechanism by which this event led to injury; and the object(s) or substance(s) most important in the event. The type of place at which the event occurred, and the activity of the person who was injured should be indicated.

Comments: The narrative of the injury event is very important to injury control workers as it identifies features of the event not revealed by coded data.

This is a basic item for injury surveillance. The text description of the injury event is structured to indicate context, place, what went wrong and how the event resulted in injury. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

National standards for mental health services review status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Specialised mental health service unit—implementation of National standards for mental health services status, code N
METeOR identifier:	287800
Registration status:	Health, Standard 08/12/2004
Definition:	The extent of progress made by a specialised mental health service unit in implementing the National Standards for Mental Health Services by or at 30 June, as represented by a code.
Data Element Concept:	Specialised mental health service unit—implementation of National standards for mental health services status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	The service unit had been reviewed by an external accreditation agency and was judged to have met the National standards
2	The service unit had been reviewed by an external accreditation agency and was judged to have met some but not all of the National standards
3	The service unit was in the process of being reviewed by an external accreditation agency but the outcomes were not known
4	The service unit was booked for review by an external accreditation agency and was engaged in self-assessment preparation prior to the formal external review
5	The service unit was engaged in self-assessment in relation to the National Standards but did not have a contractual arrangement with an external accreditation agency for review
6	The service unit had not commenced the

	preparations for review by an external accreditation agency but this was intended to be undertaken in the future
7	It had not been resolved whether the service unit would undertake review by an external accreditation agency under the National standards
8	The National standards are not applicable to this service unit

Collection and usage attributes

Guide for use:

Code 8 The National standards are not applicable to this service unit

This code should only be used for:

- non-government organisation mental health services and private hospitals (that receive some government funding to provide specialised mental health services) where implementation of National standards for mental health services has not been agreed with the relevant state or territory; or
- those aged care residential services (e.g. psychogeriatric nursing homes) in receipt of funding under the *Aged Care Act* and subject to Commonwealth residential aged care reporting and service standards requirements.

Data element attributes

Collection and usage attributes

Collection methods:

Report the review/accreditation status at 30 June for each service unit for the National standards for mental health services using the standard set of codes shown in the value domain.

For organisations that include more than one service unit the codes relating to each service should be completed. Reporting of progress at the individual service unit level recognises that parts rather than whole organisations may be implementing the standards.

NOTE: for admitted patient setting only, these data need to be disaggregated by specialised mental health service program type and specialised mental health service target population.

26	Effect of venom, or any insect bite
27	Other specified nature of injury
28	Injury of unspecified nature
29	Multiple injuries of more than one 'nature'
30	No injury detected

Data element attributes

Collection and usage attributes

Guide for use:

If the full ICD-10-AM code is used to code the injury, this metadata item is not required (see metadata items principal diagnosis and additional diagnosis) When coding to the full ICD-10-AM code is not possible, use this metadata item with the items external cause of injury-non admitted patient, external cause of injury-human intent and bodily location of main injury.

Select the code which best characterises the nature of the injury chiefly responsible for the attendance, on the basis of the information available at the time it is recorded. If two or more categories are judged to be equally appropriate, select the one that comes first in the code list. A major injury, if present, should always be coded rather than a minor injury. If a major injury has been sustained (e.g. a fractured femur), along with one or more minor injuries (e.g. some small abrasions), the major injury should be coded in preference to coding 'multiple injuries'. As a general guide, an injury which, on its own, would be unlikely to have led to the attendance may be regarded as 'minor'.

If the nature of the injury code is 01 to 12 or 26 to 29 then the metadata item Bodily location of main injury should be used to record the bodily location of the injury. If another code is used, bodily location is implicit or meaningless. Bodily location of main injury, category 22 may be used as a filler to indicate that specific body region is not required.

Comments: Injury diagnosis is necessary for purposes including epidemiological research, casemix studies and planning. This metadata item together with the metadata item bodily location of the main injury indicates the diagnosis.

This metadata item is related to the ICD-10-AM injury and poisoning classification. However, coding to the full ICD-10-AM injury and poisoning classification (see metadata item principal diagnosis) is not available in most settings where basic injury surveillance is undertaken. This item, in combination with the metadata item Bodily location of main injury, is a practicable alternative. Data coded to the full ICD-10-AM codes can be aggregated to match this item, facilitating data comparison. Further information on the national injury surveillance program can be obtained from the National Injury Surveillance Unit, Flinders University, Adelaide.

Neo-adjuvant therapy

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—neoadjuvant therapy indicator, code N
METeOR identifier:	370014
Registration status:	Health, Standard 06/03/2009
Definition:	Whether a person with a solid tumour has received neoadjuvant therapy, as represented by a code.
Data Element Concept:	Person with cancer—neoadjuvant therapy indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

To be reported when therapy is received after a diagnosis of cancer and prior to primary surgical treatment.

This data item is used to flag cases in which tumour descriptors, for example solid tumour size, may be inaccurate due to shrinkage from neoadjuvant therapy.

Yes - indicates that the client has received neo-adjuvant therapy after a diagnosis of cancer and prior to primary surgical treatment

No - indicates that the client did not receive neo-adjuvant therapy after a diagnosis of cancer and prior to primary surgical treatment

For invasive breast cancer:

Information is obtained from

- Clinical notes on pathology report mentions that patient underwent chemotherapy prior to surgery
- Microscopy section of pathology report describes tumour changes as a result of neoadjuvant therapy (coder may be

alerted to look for this detail by a long interval between biopsy and wider excision)

- Hospital notification indicates that admission if for chemotherapy only (and admission date is before that for surgery)

Comments: Preoperative chemotherapy and/or radiotherapy may be received after a diagnosis of cancer but before surgical treatment.

The effects of chemotherapy and/or radiotherapy prior to surgery will shrink the tumour and so the size of the tumour found from the subsequent surgical excision will be smaller than the original size of the tumour at the time of diagnosis. This impacts on the TNM-T and staging classification, and is important to take into account for analysis and research.

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

This data element is used to differentiate between services that receive some government funding but are run by the non-government non-profit sector (code 1) and other services (code 2).

CODE 1 is to be used when the service is managed by an organisation that:

- is not controlled by government, and is either,

- an income tax exempt charity; and/or
- does not distribute any profits to members or external parties.

CODE 2 is to be used for all other services.

	Value	Meaning
Permissible values:	1	Gastrointestinal site
	2	Genitourinary site
	3	Intracranial site
	4	Pulmonary site
	5	Pericardial site
	6	Other site(s)
	7	Unidentified site
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

NOTE: Excludes bleeding arising from instrumented sites.

CODE 1 Gastrointestinal site

Use this code when the person's spontaneous bleeding is originating from the gastrointestinal area.

CODE 2 Genitourinary site

Use this code when the person's spontaneous bleeding is originating from the genitourinary area.

CODE 3 Intracranial site

Use this code when the person's spontaneous bleeding is originating from an intracranial site.

CODE 4 Pulmonary site

Use this code when the person's spontaneous bleeding is originating from a pulmonary site.

CODE 5 Pericardial site

Use this code when the person's spontaneous bleeding is originating from the pericardium.

CODE 6 Other site(s)

Use this code when the person's spontaneous bleeding is originating from a site not listed in codes 1-5.

CODE 7 Unidentified site

Use this code when the person has a fall in haemoglobin without an identifiable spontaneous site of bleeding.

CODE 99 Not stated/inadequately described

Not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: Record the location of all bleeding events that occur. More than one code can be applied.

Relational attributes

Number of caesarean sections

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Female—number of caesarean sections, total count N[N]
METeOR identifier:	297820
Registration status:	Health, Standard 29/11/2006
Definition:	The total number of previous caesarean sections performed on the woman.
Data Element Concept:	Female—number of caesarean sections

Value domain attributes

Representational attributes

Representation class:	Total	
Data type:	Number	
Format:	N[N]	
Maximum character length:	2	
Supplementary values:	Value	Meaning
	99	Not stated/Inadequately described
Unit of measure:	Caesarean sections	

Source and reference attributes

Submitting organisation: National Perinatal Data Development Committee

Data element attributes

Collection and usage attributes

Guide for use:

In the case of multiple births, count the number of operations the mother has had, rather than the number of babies born.

Exclude the current birth if by caesarean section.

Record as 0 if no previous caesarean sections.

Comments:

Previous caesarean sections are associated with a higher risk of obstetric complications, and when used with other indicators provides important information on the quality of obstetric care.

Source and reference attributes

Submitting organisation: National Perinatal Data Development Committee

Number of clients receiving services

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Specialised mental health service—number of clients receiving services, total NNNNNN

METeOR identifier: 425401

Registration status: Health, Standard 07/12/2011

Definition: The total number of people or clients who received services provided by an **ambulatory mental health care service** unit.

Data Element Concept: Specialised mental health service—number of clients receiving services

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NNNNNN

Maximum character length: 6

Unit of measure: Person

Data element attributes

Collection and usage attributes

Guide for use: The total number of clients is reported by ambulatory mental health care service units to the Mental health establishments NMDS. The total should be a count of uniquely identifiable individuals at the service unit level, regardless of the registration status of the client, who are reported to the Community mental health care NMDS.

Source and reference attributes

Number of contacts—psychiatric outpatient clinic/day program

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—number of psychiatric outpatient clinic/day program attendances (financial year), total days N[NN]
METeOR identifier:	270121
Registration status:	Health, Standard 01/03/2005
Definition:	Number of days that a patient attended a psychiatric outpatient clinic or a day program during the relevant financial year.
Data Element Concept:	Patient—number of psychiatric outpatient clinic/day program attendances

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Collection methods:

All States and Territories where there are public psychiatric hospitals also collect date of contact, and number of contacts during the financial year can be derived from this. (Collection status for New South Wales is unknown at time of writing.)

Comments:

This metadata item gives a measure of the level of service provided.

In December 1998, the National Health Information Management Group decided that the new version of this metadata item (named Person—number of service contact dates, total N[NN]) would be implemented from 1 July 2000 in the Community Mental Health National Minimum Data Set (NMDS). Until then agencies involved in the Community mental health NMDS may report either Patient—number of psychiatric outpatient clinic/day program attendances (financial year), total days N[NN] or

Person—number of service contact dates, total N[NN] with the expectation that agencies will make their best efforts to report against the new version of this metadata item (Person—number of service contact dates, total N[NN]) from 1 July 1999.

Source and reference attributes

Number of coronary artery lesions attempted

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—count of coronary artery lesions attempted, total number N[N]
METeOR identifier:	344404
Registration status:	Health, Standard 01/10/2008
Definition:	A count of number of a person's coronary artery lesions into which an attempt was made to pass a percutaneous coronary intervention (PCI) guidewire.
Data Element Concept:	Person—count of coronary artery lesions attempted

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Record the total number of lesions into which an attempt was made to pass a PCI guidewire during a single given PCI procedure, whether they were successful or not.

The number of lesions attempted should be reported for each PCI performed.

The value '99' is not for use in primary data collections.

Collection methods:

The number of lesions attempted should be recorded from the angioplasty report.

Relational attributes

Implementation in Data Set Specifications:

Coronary artery cluster Health, Standard 01/10/2008

Conditional obligation:

Record when a percutaneous coronary intervention is performed.

Number of coronary artery lesions successfully dilated

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—count of coronary artery lesions successfully dilated, total number N[N]
METeOR identifier:	344411
Registration status:	Health, Standard 01/10/2008
Definition:	The number of a person's coronary artery lesions successfully dilated.
Data Element Concept:	Person—count of coronary artery lesions successfully dilated

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

The number of lesions successfully dilated should be recorded for each percutaneous coronary intervention (PCI) performed.

Successful dilation is where:

- residual stenosis is less than 10% following coronary stenting; OR
- residual stenosis is less than 50% after balloon angioplasty alone.

The value '99' is not for use in primary data collections.

Collection methods:

The number of lesions successfully dilated should be recorded from the angioplasty report.

Relational attributes

Implementation in Data Set Specifications:

Coronary artery cluster Health, Standard 01/10/2008

Conditional obligation:
Record when a percutaneous coronary intervention is performed.

Number of coronary artery stents

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—count of coronary artery stents, total number N[N]
METeOR identifier:	344417
Registration status:	Health, Standard 01/10/2008
Definition:	The number of stents placed during a person's angioplasty procedure.
Data Element Concept:	Person—count of coronary artery stents

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: The value '99' is not for use in primary data collections.

Collection methods: Record the total number of coronary stents placed during the entire angioplasty procedure, regardless of the number of individual lesions.

Relational attributes

Implementation in Data Set Specifications: Coronary artery cluster Health, Standard 01/10/2008

Conditional obligation:

Record when a percutaneous coronary intervention with stent implantation (bare metal stent or drug eluting stent) is performed.

Number of days in special/neonatal intensive care

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care—length of stay (special/neonatal intensive care), total days N[NN]
METeOR identifier:	270057
Registration status:	Health, Standard 01/03/2005
Definition:	The total number of days spent by a neonate in a special care or neonatal intensive care nursery (in the hospital of birth).
Data Element Concept:	Episode of admitted patient care—length of stay (special/neonatal intensive care)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

The number of days is calculated from the date the baby left the special/neonatal **intensive care unit** minus the date the baby was admitted to the special/neonatal intensive care unit.

Collection methods:

This item is to be completed if baby has been treated in an intensive care unit or a special care nursery (SCN).

Comments:

An indicator of the requirements for hospital care of high-risk babies in specialised nurseries that add to costs because of extra staffing and facilities.

SCN are staffed and equipped to provide a full range of neonatal services for the majority of complicated neonatal problems, including short-term assisted ventilation and intravenous therapy.

Neonatal intensive care nurseries (NICN) are staffed and equipped to treat critically ill newborn babies including those requiring prolonged assisted respiratory support, intravenous therapy, and alimentation and treatment of serious infections. Full supportive services are readily available throughout the hospital. These NICN also provide consultative services to other hospitals.

Source and reference attributes

Submitting organisation: National Perinatal Data Development Committee

Number of days of hospital-in-the-home care

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of admitted patient care—number of days of hospital-in-the-home care, total {N[NN]}

METeOR identifier: 270305

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: The number of **hospital-in-the-home** days occurring within an episode of care for an admitted patient.

Data Element Concept: Episode of admitted patient care—number of days of hospital-in-the-home care

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: {N[NN]}

Maximum character length: 3

Unit of measure: Day

Data element attributes

Collection and usage attributes

Guide for use: The rules for calculating the number of **hospital-in-the-home** days are outlined below:

- The number of hospital-in-the-home days is calculated with reference to the date of admission, date of separation, leave days and any date(s) of change between hospital and home accommodation;
- The date of admission is counted if the patient was at home at the end of the day;
- The date of change between hospital and home accommodation is counted if the patient was at home at the end of the day;
- The date of separation is not counted, even if the patient was at home at the end of the day;
- The normal rules for calculation of patient days apply, for example in relation to leave and same day patients.

Comments: Number of days of hospital-in-the-home care data will be collected from all states and territories except Western

Australia from 1 July 2001. Western Australia will begin to collect data from a later date.

Number of episodes of angina in last 24 hours

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—angina episodes count (24 hours preceding hospital presentation), total number NN[N]
METeOR identifier:	338293
Registration status:	Health, Standard 01/10/2008
Definition:	The number of angina episodes experienced by a person in the 24 hours preceding presentation to the hospital, including the current episode.
Data Element Concept:	Person—count of angina episodes

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	NN[N]
Maximum character length:	3

Supplementary values:

Value	Meaning
999	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Is the total number of distinct episodes of anginal pain that occurred in the 24 hours preceding presentation to the hospital, including the current episode for which the person presented to hospital.

An episode of angina may include chest pain (which may spread to either or both shoulders, the back, neck, jaws or down the arm) or overwhelming shortness of breath.

Collection methods:

Ask the individual how many distinct episodes of anginal pain he/she experienced in the 24 hours preceding presentation to hospital, including the current episode. Alternatively, if available, obtain this information from appropriate documentation.

Number of group sessions

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—number of group sessions, total N[NNNNN]
Synonymous names:	Group occasions of service
METeOR identifier:	336900
Registration status:	Health, Standard 04/07/2007
Definition:	The total number of groups of patients receiving services. Each group is to be counted once, irrespective of the size of the group of patients or the number of staff providing services.
Data Element Concept:	Establishment—number of group sessions

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NNNNN]
Maximum character length:	6
Unit of measure:	Group session

Data element attributes

Collection and usage attributes

Guide for use:

A group is defined as two or more patients receiving the same services at the same time from the same hospital staff at the same clinics.

The following guides for use apply:

- a group session is counted only for two or more patients attending in the capacity of patients in their own right, even if other non-patient persons are present for the service.
- Spouses, parents or carers attending the session are counted for the group session only if they are also participating in the service as a patient.
- A group session is counted for staff attending clinics only if they are attending as a patient in their own right. Staff training and education is excluded.
- A group session may be delivered by more than one provider. A group session is counted for two or more

patients receiving the same services, even if more than one provider delivers that service simultaneously.

- Patients attending for treatment at a dialysis or a chemotherapy clinic are receiving individual services. Patients attending education sessions at chemotherapy or dialysis clinics are counted as group sessions, if two or more people are receiving the same services at the same time.

Collection methods: Where a patient receives multidisciplinary care within one booked clinic appointment as part of a group, one group session shall be recorded, regardless of the number of providers involved. For example, if a group session is jointly delivered by a physiotherapist and an occupational therapist, one group session is counted for the patients attending that session.

Number of leave periods

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of admitted patient care—number of leave periods, total N[N]

METeOR identifier: 270058

Registration status: Health, Standard 01/03/2005

Definition: Number of leave periods in a hospital stay (excluding one-day leave periods for admitted patients).

Data Element Concept: Episode of admitted patient care—number of leave periods

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Maximum character length: 2

Unit of measure: Period

Data element attributes

Collection and usage attributes

Guide for use: If the period of leave is greater than seven days or the patient fails to return from leave, the patient is discharged.

Comments: Recording of leave periods allows for the calculation of patient days excluding leave. This is important for analysis of costs per patient and for planning. The maximum limit allowed for leave affects admission and **separation** rates, particularly for long-stay patients who may have several leave periods.

This data element was modified in July 1996 to exclude the previous differentiation between the psychiatric and other patients at the instigation of the National Mental Health Strategy Committee.

Source and reference attributes

Origin: National Health Data Committee

Number of occasions of service

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—number of occasions of service, total N[NNNNNN]

Synonymous names: Individual occasions of service

METeOR identifier: 336947

Registration status: Health, Standard 04/07/2007

Definition: The total number of occasions of examination, consultation, treatment or other service provided to a patient.

Data Element Concept: Establishment—number of occasions of service

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNNNN]

Maximum character length: 7

Unit of measure: Occasion of service

Data element attributes

Collection and usage attributes

Guide for use: The following guides for use apply:

- an occasion of service is counted for each person attending in the capacity of a patient in their own right, even if other non-patient persons are present for the service.
- spouses, parents or carers attending the session are only counted if they are also participating in the service as a patient.
- in the instance of a dependent child presenting to a clinic, the session is counted as a single Occasion of Service provided to the individual child for whom an event history is being recorded. Where parents/carers also attend in the capacity of patients themselves within a booked appointment, and receive the same services at the same time, the child and parent/carer can be counted as a group. In this instance a Group Session count would be recorded.
- An occasion of service is counted for staff attending

clinics of public hospitals only if they are attending as patients in their own right. Staff education and training is excluded.

- Patients attending for treatment at a dialysis or a chemotherapy clinic are receiving individual services. Patients attending education sessions at chemotherapy or dialysis clinics are counted as group sessions, if two or more people receiving the same services at the same time.

Collection methods:

- Where a patient receives the occasion of service is counted at the clinic of the public hospital where the patient is booked.
- Where a patient receives multidisciplinary care, within one booked clinic appointment by themselves, one occasion of service shall be recorded, regardless of the number of providers involved.
- Where patients have received more than one booked appointment, each appointment will be counted as one occasion of service. (Example: three booked appointments with all services provided on a single day will be counted as three occasions of service).
- The occasion of service count should be attributed to the clinic type associated with the booked appointment.
- Services to individual patients should be counted separately from services to groups of patients. An occasion of service is counted only for a service provided to an individual. Group sessions are reported separately under 'Establishment - number of group sessions total N[NNNNNN]'.

Number of qualified days for newborns

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of admitted patient care (newborn)—number of qualified days, total N[NNNN]
METeOR identifier:	270033
Registration status:	Health, Standard 01/03/2005
Definition:	The number of qualified newborn days occurring within a newborn episode of care.
Data Element Concept:	Episode of admitted patient care (newborn)—number of qualified days

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NNNN]
Maximum character length:	5
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

The rules for calculating the number of qualified newborn days are outlined below. The number of qualified days is calculated with reference to the Episode of admitted patient care—admission date, DDMMYYYY, Episode of admitted patient care—separation date, DDMMYYYY and any Episode of admitted patient care (newborn)—date of change to qualification status, DDMMYYYY:

- the date of admission is counted if the patient was qualified at the end of the day
- the date of change to qualification status is counted if the patient was qualified at the end of the day
- the date of separation is not counted, even if the patient was qualified on that day
- the normal rules for calculation of patient days apply, for example in relation to leave and same day patients

The length of stay for a newborn episode of care is equal to the sum of the qualified and unqualified days.

Relational attributes

Number of regional lymph nodes examined

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—number of regional lymph nodes examined, total N[N]
METeOR identifier:	415971
Registration status:	Health, Standard 07/12/2011
Definition:	The total number of regional lymph nodes examined by a pathologist in a person with cancer.
Data Element Concept:	Person with cancer—number of regional lymph nodes examined

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

A list of which lymph nodes are defined as regional lymph nodes for each cancer site may be found in the current edition of the TNM Classification of Tumours, UICC (International Union Against Cancer) or the AJCC (American Joint Committee on Cancer) Cancer Staging Manual.

The number includes all nodes examined regardless of whether they were removed and examined at a single or multiple procedures. For example, for breast cancer, record the sum of regional lymph nodes examined from node sampling, sentinel node biopsy and axillary clearance.

The number of regional lymph nodes is cumulative from all procedures that removed lymph nodes through the completion of surgeries for the initial treatment of the cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

Breast cancer:

Regional lymph nodes include all ipsilateral axillary nodes (levels 1, 2 and 3), ipsilateral internal mammary nodes, supraclavicular nodes and intramammary lymph nodes. All other nodes (including contralateral axillary, contralateral internal mammary nodes and cervical nodes) are considered to be distant metastases and should not be recorded in this data item. Definitions are from the UICC TNM Classification of Malignant Tumours, 7th Edition.

Collection methods: For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease.

Number of service contacts within a treatment episode for alcohol and other drug

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—number of service contacts, total N[NN]
METeOR identifier:	270117
Registration status:	Health, Standard 01/03/2005
Definition:	The total number of service contacts recorded between a client and the service provider within a treatment episode for the purpose of providing alcohol and other drug treatment.
Data Element Concept:	Episode of treatment for alcohol and other drugs—number of service contacts

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Service contact

Data element attributes

Collection and usage attributes

Guide for use:	This metadata item is a count of service contacts related to treatment that are recorded on a client record. Any client contact that does not constitute part of a treatment should not be considered a service contact. Contact with the client for administrative purposes, such as arranging an appointment, should not be included. This item is not collected for residential clients. Where multiple service provider staff have contact with the client at the same time, on the same occasion of service, the contact is counted only once. When multiple service contacts are recorded on the same day, each independent contact should be counted separately.
Collection methods:	To be collated at the close of a treatment episode.

Comments: This metadata item provides a measure of the frequency of client contact and service utilisation within a treatment episode.

Number of tobacco cigarettes smoked per day after 20 weeks of pregnancy

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Female (pregnant)—number of cigarettes smoked (per day after 20 weeks of pregnancy), number N[NN]

METeOR identifier: 365445

Registration status: Health, Standard 03/12/2008

Definition: The self-reported number of cigarettes usually smoked daily by a pregnant woman after the first 20 weeks of pregnancy until the birth

Context: Perinatal Statistics

Data Element Concept: Female (pregnant)—number of cigarettes smoked (after 20 weeks of pregnancy)

Value domain attributes

Representational attributes

Representation class: Quantity

Data type: Number

Format: N[NN]

Maximum character length: 3

Supplementary values:

Value	Meaning
998	Occasional smoking (less than one)
999	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: Data should be collected after the birth.
 'After 20 weeks' is defined as greater than or equal to 20 completed weeks' gestation (>=20 weeks + 0 days).
 'Usually' is defined as 'according to established, or frequent usage; commonly, ordinarily; as a rule'. If a woman reports having quit smoking at some point between 20 weeks of pregnancy and the birth, the value recorded should be the number of cigarettes usually smoked daily prior to quitting.

Collection methods: Recommended question: 'How many tobacco cigarettes did the woman usually smoke each day after 20 weeks of pregnancy?', where after 20 weeks of pregnancy is defined as greater than or equal to 20 weeks + 0 days.

If a woman did not smoke tobacco cigarettes at any time after 20 weeks of pregnancy, a value of 000 should be recorded.

Occasional smoking
Women who report that they usually smoked less than one tobacco cigarette per day should have a value recorded of 998.

Nursing diagnosis—other

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of care—nursing diagnosis (other), code (NANDA 1997-98) N.N[{.N}{.N}{.N}{.N}]
METeOR identifier:	270466
Registration status:	Health, Standard 01/03/2005
Definition:	The nursing diagnosis other than the principal nursing diagnosis, as represented by a code.
Data Element Concept:	Episode of care—nursing diagnosis

Value domain attributes

Representational attributes

Classification scheme:	North American Nursing Diagnosis Association (NANDA) Taxonomy 1997-1998
Representation class:	Code
Data type:	Number
Format:	N.N[{.N}{.N}{.N}{.N}]
Maximum character length:	6

Collection and usage attributes

Guide for use:

The NANDA codes should be used in conjunction with a nursing diagnosis text. The NANDA coding structure is a standard format for reporting nursing diagnosis. It is not intended in any way to change or intrude upon nursing practice, provided the information available can transpose to the NANDA codes for the Community Nursing Minimum Data Set - Australia (CNMDSA).

Data element attributes

Collection and usage attributes

Guide for use:

Up to seven nursing diagnoses may be nominated, according to the following:

1. Nursing diagnosis most related to the principal reason for admission (one only)

2-6. Other nursing diagnoses or relevance to the current episode.

Collection methods:

In considering how nursing diagnosis could be implemented, agencies may opt to introduce systems transparent to the clinician if there is confidence that a direct and reliable transfer to NANDA codes can be made from information already in place.

Agencies implementing new information systems should consider the extent to which these can facilitate practice and at the same time lighten the burden of documentation. Direct incorporation of the codeset or automated mapping to it when the information is at a more detailed level are equally valid and viable options.

Comments: The Community Nursing Minimum Data Set - Australia (CNMDSA) Steering Committee considered information from users of the data in relation to this metadata item. Many users have found the taxonomy wanting in its ability to describe the full range of persons and conditions seen by community nurses in the Australian setting. In the absence of an alternative taxonomy with wide acceptance, the CNMDSA Steering Committee has decided to retain North American Nursing Diagnosis Association (NANDA). The University of Iowa has a written agreement with NANDA to expand the relevance of NANDA. The Australian Council of Community Nursing Services (ACCNS) has sought collaboration with a United States of America project at the University of Iowa which is seeking to refine, extend, validate and classify the NANDA taxonomy.

Nursing interventions

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Community nursing service episode—nursing intervention, code N
METeOR identifier:	270223
Registration status:	Health, Standard 01/03/2005
Definition:	The nursing action intended to relieve or alter a person's responses to actual or potential health problems, as represented by a code.
Data Element Concept:	Community nursing service episode—nursing intervention

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Coordination and collaboration of care
2	Supporting informal carers
3	General nursing care
4	Technical nursing treatment or procedure
5	Counselling and emotional support
6	Teaching/education
7	Monitoring and surveillance
8	Formal case management
9	Service needs assessment only

Collection and usage attributes

Guide for use:

The following definitions are to assist in coding:

CODE 1 Coordination and collaboration of care

This code occurs when there are multiple care deliverers. The goal of coordination and collaboration is the efficient, appropriate integrated delivery of care to the person. Tasks which may be involved include: liaison, advocacy, planning, referral, information and supportive discussion and/or education. Although similar in nature to formal case management this intervention is not the one formally recognised by specific funding (see Code 8).

CODE 2 Supporting information carers

This code includes activities, which the nurse undertakes to assist the carer in the delivery of the carer's role. This does not include care given directly to the person. Examples of tasks involved in supporting the carer include: counselling, teaching, informing, advocacy, coordinating, and grief or bereavement support.

CODE 3 General nursing care

This code includes a broad range of activities, which the nurse performs to directly assist the person; in many cases, this assistance will focus on activities of daily living. This assistance will help a person whose health status, level of dependency, and/or therapeutic needs are such that nursing skills are required. Examples of tasks include: assistance with washing, grooming and maintaining hygiene, dressing, pressure area care, assistance with toileting, bladder and bowel care, assistance with mobility and therapeutic exercise, attention to physical comfort and maintaining a therapeutic environment.

CODE 4 Technical nursing treatment or procedure

This code refers to technical tasks and procedures for which nurses receive specific training and which require nursing knowledge of expected therapeutic effect, possible side-effects, complications and appropriate actions related to each. Some examples of technical care activities are: medication administration (including injections), dressings and other procedures, venipuncture, monitoring of dialysis, and implementation of pain management technology.

CODE 5 Counselling and emotional support

This code focuses on non-physical care given to the person, which aims to address the affective, psychological and/or social needs. Examples of these include: bereavement, well being, decision-making support and values-clarification.

CODE 6 Teaching/education

This code refers to providing information and/or instruction about a specific body of knowledge and/or procedure, which is relevant to the person's situation. Examples of teaching areas include: disease process, technical procedure, health maintenance, health promotion and techniques for coping with a disability.

CODE 7 Monitoring and surveillance

This code refers to any action by which the nurse evaluates and monitors physical, behavioural, social and emotional responses to disease, injury, and nursing or medical interventions.

CODE 8 Formal case management

This code refers to the specific formal service, which is funded to provide case management for a person. Note that coordination and collaboration of care (Code 1) is not the same as formal case management.

CODE 9 Service needs assessment only

This code is for assessment of the person when this is the only activity carried out and no further nursing care is given; for example, assessment for ongoing care and/or inappropriate referrals. Selection of this option means that no other intervention may be nominated. Thus, if an assessment for the domiciliary care benefit is the reason for a visit, but other interventions such as, counselling and support; coordination/collaboration of care are carried out, then the assessment only is not an appropriate code.

Data element attributes

Collection and usage attributes

Guide for use:

Up to eight codes may be selected. If Code 9 is selected no other nursing interventions are collected. If Code 9 is selected then code 07 in Community nursing service episode—goal of care, code NN must also be selected.

Collection methods:

Collect on continuing basis throughout the episode in the event of data collection that occurs prior to discharge. Up to eight codes may be collected. Within a computerised information system the detailed activities can be mapped to the Community Nursing Minimum Data Set Australia (CNMDSA) interventions enabling the option of a rich level of detail of activities or summarised information.

Comments:

For the purposes of the CNMDSA, the interventions are not necessarily linked to each nursing problem, nor are they specific tasks, but rather, broader-level intervention categories focusing on the major areas of a person's need. These summary categories subsume a range of specific actions or tasks.

The CNMDSA nursing interventions are summary information overlying the detailed nursing activity usually included in an agency data collection. They are not intended as a description of nursing activities in the CNMDSA. For instance, 'technical nursing treatment' or 'procedure' is the generic term for a broad range of nursing activities such as medication administration and wound care management.

Collection of this information at discharge carries with it the expectation that nursing records will lend themselves to this level of summarisation of the care episode. The selection of eight interventions if more are specified is a potentially subjective task unless the nursing record is structured and clear enough to enable such a selection against the reasons for admission to care, and the major focus of care delivery. Clearly, the task is easier if ongoing automated recording of interventions within an agency information system enables discharge reporting of all interventions and their frequency, over a care episode.

Those agencies providing allied health services may wish to use the Physiotherapy and Occupational Therapy Interventions developed in conjunction with the National Centre for Classification in Health in addition to the CNMDSA data element Nursing interventions or other more relevant code sets.

To enable analysis of the interventions within an episode of care, in relation to the outcome of this care, especially when linked with information on the diagnosis and goals. The recording of nursing interventions is critical information for health service monitoring and planning. It is a major descriptor of the care provided throughout an episode.

Oestrogen receptor assay result

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—oestrogen receptor assay result, code N
METeOR identifier:	370036
Registration status:	Health, Standard 06/03/2009
Definition:	The result of oestrogen receptor assay at the time of diagnosis of the primary breast tumour, as represented by a code.
Data Element Concept:	Person with cancer—oestrogen receptor assay result

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Positive
	2	Negative
	3	Equivocal
Supplementary values:	7	Unknown (test results not available)
	8	Not applicable (test not done)

Collection and usage attributes

Guide for use:

Supplementary codes

CODE 7 Unknown (test results not available)

Use this code when the test has been performed but the results are not yet available for analysis.

CODE 8 Not applicable (test not done)

This code is used as a validation measure, to show that the reason for the lack of results is due to the test not being performed.

Data element attributes

Collection and usage attributes

Guide for use: Where the pathologist has stated the test result in the conclusion of the pathology report as being positive, negative or equivocal this value should be coded. If the report does not specifically state the test result, this should be interpreted from the reported % nuclei stained positive. If => 1% of nuclei are reported as stained regardless of stain intensity (weak, intermediate or high/strong) the result is positive. If % nuclei stained is <1% the result is negative. Definitions from NBOCC & ACN Pathology Reporting Guidelines.

Collection methods: For cancer registries:

Collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or subsequent metastatic disease.

Where there are multiple reports relating to the primary breast tumour (from different specimens), the 'most positive' value is chosen according to the following hierarchy: Positive > Equivocal > Negative> Test done but results not known > Test not done.

If oestrogen receptor assay tests are completed for invasive tumours with an in situ component, use the values from the invasive tumour.

Do not record oestrogen receptor values for in situ tumours.

For multifocal tumours, use the oestrogen receptor value from the largest focus or from a metastatic deposit, e.g. Lymph node metastasis. A smaller focus that is ER positive may in fact be the source of a metastasis and in this setting the patient would derive benefit from the therapy offered as a result of hormone receptor positive status.

Comments: Hormone receptor status is an important prognostic indicator for breast cancer.

The Australian Cancer Network Working Party established to develop guidelines for the pathology reporting of breast cancer recommends that hormone receptor assays be performed on all cases of invasive breast carcinoma. The report should include

- the percentage of nuclei staining positive and the predominant staining intensity (low, medium, high) and
- a conclusion as to whether the assay is positive or negative.

Data element attributes

Collection and usage attributes

Guide for use:

This is a repeating record of both eyes.

1st field - Right retina

2nd field - Left retina

Record the result of the fundus examination for each eye as: Normal/ Diabetes abnormality/ Non-diabetes abnormality/ or Not visualised.

Example:

- code 12 for right retina Normal and left retina Diabetes abnormality
- code 32 for right retina Non-diabetes abnormality and left retina Diabetes abnormality

Only the result of an assessment carried out in the last 12 months should be recorded.

Collection methods: Ophthalmological assessment should be performed by an ophthalmologist or a suitably trained clinician.

A comprehensive ophthalmological examination includes:

- Checking visual acuity with Snellen chart - correct with pinhole if indicated;
- Examination for cataract;
- Examination of fundi with pupils dilated.

Organisation expenses, total Australian currency

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Organisation—expenses, total Australian currency NNNNN.N

METeOR identifier: 359963

Registration status: Health, Standard 05/12/2007

Definition: Expenses of an organisation consisting mainly of wages, salaries and supplements, superannuation employer contributions, workers compensation premiums and payouts, purchases of goods and services and consumption of fixed capital (depreciation), in Australian currency.

Data Element Concept: Organisation—expenses

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: NNNNN.N

Maximum character length: 6

Unit of measure: Australian currency (AU$)

Source and reference attributes

Submitting organisation: Health Expenditure Advisory Committee

Data element attributes

Collection and usage attributes

Guide for use: Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.

Expenses are to be reported in millions to the nearest 100,000 e.g. $4,064,000 should be reported as $4.1 million.

When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).

Includes:

- Salaries, wages and supplements
- Superannuation employer contributions

- Workers compensation premiums and payments
- Consumption of fixed capital (depreciation).
- Administrative expenses (excluding workers compensation premiums and payouts)
- Domestic services
- Drug supplies
- Food supplies
- Grants
- Medical and surgical supplies
- Patient transport
- Payments to visiting medical officers
- Repairs and maintenance
- Social benefits
- Subsidy expenses
- Other expenses

Collection methods:

Expenses are to be reported for the *Health industry relevant organisation type* and *Type of health and health related functions* data elements.

Health industry relevant organisation type

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments:

In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Value domain attributes

Representational attributes

Representation class: Text

Data type: String

Format: [X(200)]

Maximum character length: 200

Data element attributes

Collection and usage attributes

Guide for use: Generally, the complete establishment, agency or organisation name should be used to avoid any ambiguity in identification. This should usually be the same as company registration name. However, in certain circumstances (e.g. internal use), a short name (i.e. an abbreviated name by which the organisation is known) or a locally used name (e.g. where a medical practice is known by a name that is different to the company registration name) can be used. Further, a business unit within an organisation may have its own separate identity; this should be captured (as the unit name – see Organisation name type).

More than one name can be recorded for an organisation. That is, this field is a multiple occurring field. At least one organisation name must be recorded for each organisation and each name must have an appropriate Organisation name type.

Guide for use:

The name of specialised mental health service organisations are determined by the relevant state or territory. Note that organisation is defined according to the object class *Specialised mental health service organisation*.

The name should be unique for the organisation in that state/territory. Mental health data collections are hierarchical in nature. An identical reporting structure, including organisation name, should be common between all mental health collections, including the Mental Health Establishments (MHE), Community Mental Health Care (CMHC) and Residential Mental Health Care (RMHC) NMDS's, the Mental Health National Outcomes and Casemix collection and any future mental health collections.

Submitting organisation:	Health Expenditure Advisory Committee

Data element attributes

Collection and usage attributes

Guide for use:

Revenues are to be reported in millions to the nearest 100,000 e.g. $4,064,000 should be reported as $4.1 million.

Revenue arises from:

- the sale of goods,
- the rendering of services, and
- the use by others of entity assets yielding interest, royalties and dividends.

Goods includes goods produced by the entity for the purpose of sale and goods purchased for resale, such as merchandise purchased by a retailer or land and other property held for resale.

The rendering of services typically involves the performance by the entity of a contractually agreed task over an agreed period of time. The services may be rendered within a single period or over more than one period. Some contracts for the rendering of services are directly related to construction contracts, for example, those for the services of project managers and architects. Revenue arising from these contracts is not dealt with in this Standard but is dealt with in accordance with the requirements for construction contracts as specified in AASB 111 Construction Contracts.

The use by others of entity assets gives rise to revenue in the form of:

(a) interest – charges for the use of cash or cash equivalents or amounts due to the entity;

(b) royalties – charges for the use of long-term assets of the entity, for example, patents, trademarks, copyrights and computer software; and

(c) dividends – distributions of profits to holders of equity investments in proportion to their holdings of a particular class of capital.

Revenue is the gross inflow of economic benefits during the period arising in the course of the ordinary activities of an entity when those inflows result in increases in equity, other than increases relating to contributions from equity participants.

Revenue includes only the gross inflows of economic benefits received and receivable by the entity on its own account.

Amounts collected on behalf of third parties such as sales taxes, goods and services taxes and value added taxes are not economic benefits which flow to the entity and do not result in increases in equity. Therefore, they are excluded from revenue. Similarly, in an agency relationship, the gross inflows of economic benefits include amounts collected on behalf of the principal and which do not result in increases in equity for the entity. The amounts collected on behalf of the principal are not revenue. Instead, revenue is the amount of commission.

Collection methods: Revenues are to be reported for the *Source of public and private revenue* and *Health industry relevant organisation type* data elements.

Source of public and private revenue

Other cancer treatment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—other cancer treatment, text [X(150)]
METeOR identifier:	403836
Registration status:	Health, Standard 07/12/2011
Definition:	The cancer-directed treatment administered during the initial course of treatment for cancer, other than surgery, radiotherapy or systemic therapy, as represented by text.
Data Element Concept:	Cancer treatment—other cancer treatment

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	[X(150)]
Maximum character length:	150

Source and reference attributes

Submitting organisation:	Cancer Australia

Data element attributes

Collection and usage attributes

Guide for use:

This data item is to record cancer-directed treatments that cannot be appropriately assigned to the specific treatment codes in the cancer treatment data items for surgery, radiotherapy, systemic therapy agents and systemic therapy procedures.

Cancer-directed treatments refer to those treatments that destroy or modify cancer tissue anywhere in the body. The exception to this is treatments for hematopoietic diseases (refer to additional notes below).

Cancer-directed treatments may be palliative (to control symptoms, alleviate pain, or make the patient more comfortable) or curative.

Record all other treatments administered during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

Each treatment event delivered to the patient should be recorded; multiple entries are permitted.

Record antibody treatments, vaccine treatments, and those targeted therapies that use drugs or substances other than chemotherapy agents in this data item. Targeted therapies using chemotherapy agents are recorded in the data items for chemotherapy. Targeted therapies are treatments that use drugs or other substances to identify and attack specific cancer cells.

Do not record ancillary drugs. For example, allopurinol, which is commonly used as prophylaxis with chemotherapy agents to prevent severe hyperuricemia. A list of drugs regarded as ancillary is available in the SEER*Rx-Interactive Antineoplastic Drugs Database Version 1.4.1.

Treatment events may include (for example):

- Treatment unique to hematopoietic diseases, for example, phlebotomy, transfusions or aspirin. ONLY record aspirin therapy used to thin the blood for symptomatic control of thrombocythemia. Do not record aspirin used for pain or cardiovascular protection.
- Embolisation that is performed using alcohol as an embolising agent or for embolisation to a site other than the liver where the embolising agent is unknown. Embolisation using chemotherapeutic agents is coded separately with chemotherapy, and embolisation using a radioactive agent or seeds is coded with brachytherapy-radiation treatment.
- Any experimental or newly developed treatment that cannot be appropriately assigned to other specific treatment data items.
- A double-blind clinical trial. Record the treatment actually administered to the patient in the appropriate treatment data item when the double-blind trial code is broken.
- Cancer treatments administered by non-medical personnel. This includes unconventional methods whether administered as single therapy or in combination with conventional therapies. Record alternative therapies only if the patient doesn’t receive any other type of treatment.

Collection methods: The information should be obtained from the patient’s medical record.

Comments: Information on other cancer treatments is used to describe and evaluate the quality of care and treatment practices.

Other drug of concern

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—drug of concern (other), (ASCDC 2011 extended) code NNNN
METeOR identifier:	467579
Registration status:	Health, Standard 07/12/2011
Definition:	A drug apart from the principal drug of concern which the client states as being a concern, as represented by a code.
Data Element Concept:	Episode of treatment for alcohol and other drugs—drug of concern

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Classification of Drugs of Concern 2011
Representation class:	Code
Data type:	String
Format:	NNNN
Maximum character length:	4

Supplementary values:

Value	Meaning
0005	Opioid analgesics not further defined
0006	Psychostimulants not further defined

Collection and usage attributes

Guide for use:

The Australian Standard Classification of Drugs of Concern (ASCDC) provides a number of supplementary codes that have specific uses and these are detailed within the ASCDC, e.g. 0000 = inadequately described.

Other supplementary codes that are not already specified in the ASCDC may be used in National Minimum Data Sets (NMDS) when required. In the Alcohol and other drug treatment service NMDS, two additional supplementary codes have been created which enable a finer level of detail to be captured:

CODE 0005 Opioid analgesics not further defined

This code is to be used when it is known that the client's principal drug of concern is an opioid but the specific opioid used is not known. The existing code 1000 combines opioid analgesics and non-opioid analgesics together into Analgesics nfd and the finer level of detail, although known, is lost.

CODE 0006 Psychostimulants not further defined

This code is to be used when it is known that the client's principal drug of concern is a psychostimulant but not which type. The existing code 3000 combines stimulants and hallucinogens together into Stimulants and hallucinogens nfd and the finer level of detail, although known, is lost.

Psychostimulants refer to the types of drugs that would normally be coded to 3100-3199, 3300-3399 and 3400-3499 categories plus 3903 and 3905.

Data element attributes

Collection and usage attributes

Guide for use:

Record each additional drug of concern (according to the client) relevant to the treatment episode. The other drug of concern does not need to be linked to a specific treatment type.

More than one drug may be selected. There should be no duplication with the principal drug of concern.

Collection methods:

Any other drug of concern for the client should be recorded upon commencement of a treatment episode.

For clients whose treatment episode is related to the alcohol and other drug use of another person, this metadata item should not be collected.

Comments:

This item complements principal drug of concern. The existence of other drugs of concern may have a role in determining the types of treatment required and may also influence treatment outcomes.

Other treatment type for alcohol and other drugs

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—treatment type (other), code [N]
METeOR identifier:	270076
Registration status:	Health, Standard 01/03/2005
Definition:	All other forms of treatment provided to the client in addition to the main treatment type for alcohol and other drugs, as represented by a code.
Data Element Concept:	Episode of treatment for alcohol and other drugs—treatment type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	[N]
Maximum character length:	1

Permissible values:

Value	Meaning
1	Withdrawal management (detoxification)
2	Counselling
3	Rehabilitation
4	Pharmacotherapy
5	Other

Collection and usage attributes

Guide for use:

CODE 1 Withdrawal management (detoxification)

Refers to any form of withdrawal management, including medicated and non-medicated.

CODE 2 Counselling

Refers to any method of individual or group counselling directed towards identified problems with alcohol and/or other drug use or dependency. This selection excludes counselling activity that is part of a rehabilitation program as defined in Code 3.

CODE 3 Rehabilitation

Refers to an intensive treatment program that integrates a range of services and therapeutic activities that may include counselling, behavioural treatment approaches, recreational activities, social and community living skills, group work and relapse prevention. Rehabilitation treatment can provide a high level of support (i.e. up to 24 hours a day) and tends towards a medium to longer-term duration. Rehabilitation activities can occur in residential or non-residential settings. Counselling that is included within an overall rehabilitation program should be coded to Code 3 for Rehabilitation, not to Code 2 as a separate treatment episode for counselling.

CODE 4 Pharmacotherapy

Refers to pharmacotherapies that include those used as maintenance therapies (e.g. naltrexone, buprenorphine, and methadone treatment) and those used as relapse prevention. Use Code 1 (withdrawal management) where a pharmacotherapy is used solely for withdrawal. Note collection exclusions: excludes clients who are on an opioid pharmacotherapy maintenance program and are not receiving any other form of treatment.

Data element attributes

Collection and usage attributes

Guide for use:

To be completed at cessation of treatment episode.

Only report treatment recorded in the client's file that is in addition to, and not a component of, the main treatment type for alcohol and other drugs. Treatment activity reported here is not necessarily for principal drug of concern in that it may be treatment for other drugs of concern.

More than one code may be selected.

Collection methods:

This field should be left blank if there are no other treatment types for the episode.

Comments:

Information about treatment provided is of fundamental importance to service delivery and planning.

Outcome of treatment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—outcome of treatment, code N.N
METeOR identifier:	402047
Registration status:	Health, Standard 07/12/2011
Definition:	The response of the tumour at the completion of the initial course of treatment for cancer, as represented by a code.
Data Element Concept:	Cancer treatment—outcome of treatment

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N.N
Maximum character length:	2

	Value	Meaning
Permissible values:	1.0	Complete response/no evidence of disease
	2.1	Partial response
	2.2	Stable or static disease
	2.3	Progressive disease
Supplementary values:	7.0	Not assessed or unable to be assessed
	8.0	Unknown
	9.0	Not stated/inadequately described

Collection and usage attributes

Guide for use:

The outcome of treatment is recorded at the completion of the initial course of treatment for the cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

CODE 1.0 Complete response/no evidence of disease

Complete disappearance of all measurable disease, including tumour markers, for at least four weeks. No new lesions or new evidence of disease. For breast cancer, this reflects "No evidence of disease".

CODE 2.1 Partial response

A decrease by at least 50% of the sum of the products of the maximum diameter and perpendicular diameter of all measurable lesions, for at least four weeks. No new lesions or worsening of disease.

CODE 2.2 Stable or static disease

No change in measurable lesions qualifying as partial response or progression and no evidence of new lesions.

CODE 2.3 Progressive disease

An increase by at least 25% of the sum of the products of the maximum diameter and a perpendicular diameter of any measurable lesion, or the appearance of new lesions.

CODE 9.0 Not stated/inadequately described

The tumour was assessed but the percentage of increase or decrease in the tumour size is not stated or is inadequately described.

Outpatient clinic type—non-admitted patient

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Non-admitted patient service event—outpatient clinic type, code N[N]
METeOR identifier:	400598
Registration status:	Health, Standard 06/10/2010
Definition:	The organisational unit or organisational arrangement through which a hospital provides a service to a non-admitted patient, as represented by a code.
Context:	This data element, for use in the Non-admitted patient context, uses a value domain developed for the Outpatient care NMDS, which includes one reference to 'occasions of service'. In this context, 'occasions of service' should be interpreted as synonymous to a 'non-admitted patient service event'.
Data Element Concept:	Non-admitted patient service event—outpatient clinic type

Collection and usage attributes

Guide for use:

The rules for allocating (mapping) clinic services to the clinic codes structure is the responsibility of each State and Territory and these rules need to be applied consistently within each State and Territory.

In most cases, reference to the code guide of permissible values will be adequate to map a hospital's clinics to the data domain. If not, general principles for mapping existing clinics to the data domain should take account of (a) the nature of the specialty, (b) patient characteristics, e.g. age, and (c) the field of practice of the service provider.

Where the patient characteristics have determined that a paediatric clinic type is appropriate, then further differentiation between surgical and medical is determined by (a) the nature of the specialty, and (b) the field of practice of the service provider. That is, paediatric medical would include any investigations, treatment(s) or services provided to a child which do not pertain to the surgical care of diseases or injuries.

In paediatric hospitals, the full range of clinic types should be used.

A guide for the permissible values of codes for the outpatient clinic types is as follows:

CODE 1 Allied Health

- Audiology.
- Clinical Pharmacology.
- Neuropsychology.
- Dietetics.
- Occupational therapy.
- Optometry.
- Orthoptics.
- Orthotics.
- Physiotherapy.

- Podiatry.
- Prosthetics.
- Psychology.
- Social work.
- Speech pathology.

Includes clinics specified in mapping list above run solely by these Allied Health (AH) professionals. Example: A speech Pathologist conducting a clinic with booked patients for speech pathology services.

Excludes services provided by AH professionals in clinics classified in codes 2-23. Example: a physiotherapist running a cardiac rehabilitation clinic is classified to the Cardiology Clinic (see code 5).

CODE 2 Dental

- Dental.

CODE 3 Gynaecology

- Gynaecology.
- Gynaecological oncology (excluding chemotherapy).
- Menopause.
- Assisted reproduction, infertility.
- Family planning.

CODE 4 Obstetrics

- Obstetrics.
- Childbirth education.
- Antenatal.
- Postnatal.

Excludes gestational diabetes (see code 6).

CODE 5 Cardiology

- Cardiac rehabilitation.
- ECG.
- Doppler.
- Cardiac stress test.
- Hypertension.
- Pacemaker.

Excludes cardiac catheterisation (see code 22).

CODE 6 Endocrinology

- Endocrine.
- Gestational diabetes.
- Thyroid.
- Metabolic.
- Diabetes.
- Diabetes education.

CODE 7 Oncology

- Oncology.
- Lymphoedema.
- Radiation oncology.

Excludes chemotherapy (see code 20).

Excludes gynaecological oncology (see code 3).

CODE 8 Respiratory

- Asthma.
- Asthma education.
- Respiratory; excludes tuberculosis (see code 10).
- Cystic Fibrosis.
- Sleep.
- Pulmonary.

CODE 9 Gastroenterology

- Gastroenterology.

Excludes endoscopy (see code 13).

CODE 10 Medical

- Aged care, geriatric, gerontology.
- Allergy.
- Anti-coagulant.
- Clinical Measurement; include with relevant specialty clinic type where clinical measurement services are specific to a specialty (see codes 1-23) e.g. urodynamic analysis is counted with Urology (see code 15).
- Dementia.
- Dermatology.
- Development disability.
- Epilepsy.
- Falls.
- General medicine.
- Genetic.
- Haematology, haemophilia.
- Hepatobiliary.
- Hyperbaric medicine.
- Immunology, HIV.
- Infectious diseases; Communicable diseases; Hep B, C; includes tuberculosis.
- Men’s Health.
- Metabolic bone.
- Excludes Nephrology (see code 24); excludes renal (see code 24); excludes dialysis (see code 21).
- Neurology, neurophysiology.
- Occupational medicine.

- Other.
- Pain management
- Palliative.
- Refugee clinic.
- Rehabilitation; excludes cardiac rehabilitation (see code 5).
- Rheumatology.
- Sexual Health.
- Spinal.
- Stoma therapy.
- Transplants (excludes kidney transplants see code 24).
- Wound, Dressing clinic.

CODE 11 General practice/primary care

- General Practice, Primary Care.

Excludes Medicare billable patients; defined specialty general practice clinics only.

CODE 12 Paediatric Medical

- Adolescent health.
- Neonatology.
- Paediatric medicine.

In paediatric hospitals the full range of service types should be used. That is, paediatric medical should be reported as medical and paediatric surgery should be reported as surgery.

CODE 13 Endoscopy

Includes all occasions of service for endoscopy including cystoscopy, gastroscopy, oesophagoscopy, duodenoscopy, colonoscopy, bronchoscopy, laryngoscopy and sigmoidoscopy.

Care must be taken to ensure procedures for admitted patients are excluded from this category.

CODE 14 Plastic surgery

- Craniofacial.
- Melanoma.
- Plastic surgery.

CODE 15 Urology

- Urology.

Includes urodynamic measurement and IVPs.

CODE 16 Orthopaedic surgery

- Fracture.
- Hand.
- Orthopaedics Surgery.
- Other.
- Scoliosis.
- Neck of femur.

CODE 17 Ophthalmology

- Ophthalmology.
- Cataract extraction.
- Lens insertion.

CODE 18 Ear, nose and throat

- Ear, nose and throat.
- Otitis media.
- Oral.

CODE 19 Pre-admission and pre-anaesthesia

- Pre-admission.
- Pre-anaesthesia.

CODE 20 Chemotherapy

Includes all forms of chemotherapy.

CODE 21 Dialysis

Dialysis and includes renal dialysis education. See code 24 for Renal medicine

CODE 22 Surgery

- Cardiac.
- Vascular.
- Cardiac catheterisation.
- Colorectal.
- Upper GI surgery.
- General surgery.
- Neurosurgery.
- Other surgery.
- Thoracic surgery.

CODE 23 Paediatric surgery

In paediatric hospitals the full range of service types should be used. That is, paediatric medical should be reported as medical and paediatric surgery should be reported as surgery.

CODE 24 Renal Medical

- Renal Medicine.
- Nephrology.
- Includes pre and post transplant treatment, support and education.
- Excludes dialysis and renal dialysis education. See code 21.

- Pain management
- Palliative.
- Refugee clinic.
- Rehabilitation; excludes cardiac rehabilitation (see code

5).

- Rheumatology.
- Sexual Health.
- Spinal.
- Stoma therapy.
- Transplants (excludes kidney transplants see code 24).
- Wound, Dressing clinic.

CODE 11 General practice/primary care

- General Practice, Primary Care.

Excludes Medicare billable patients; defined specialty general practice clinics only.

CODE 12 Paediatric Medical

- Adolescent health.
- Neonatology.
- Paediatric medicine.

In paediatric hospitals the full range of service types should be used. That is, paediatric medical should be reported as medical and paediatric surgery should be reported as surgery.

CODE 13 Endoscopy

Includes all occasions of service for endoscopy including cystoscopy, gastroscopy, oesophagoscopy, duodenoscopy, colonoscopy, bronchoscopy, laryngoscopy and sigmoidoscopy.

Care must be taken to ensure procedures for admitted patients are excluded from this category.

CODE 14 Plastic surgery

- Craniofacial.
- Melanoma.
- Plastic surgery.

CODE 15 Urology

- Urology.

Includes urodynamic measurement and IVPs.

CODE 16 Orthopaedic surgery

- Fracture.
- Hand.
- Orthopaedics Surgery.
- Other.
- Scoliosis.
- Neck of femur.

CODE 17 Ophthalmology

- Ophthalmology.
- Cataract extraction.

- Lens insertion.

CODE 18 Ear, nose and throat

- Ear, nose and throat.
- Otitis media.
- Oral.

CODE 19 Pre-admission and pre-anaesthesia

- Pre-admission.
- Pre-anaesthesia.

CODE 20 Chemotherapy

Includes all forms of chemotherapy.

CODE 21 Dialysis

Dialysis and includes renal dialysis education. See code 24 for Renal medicine

CODE 22 Surgery

- Cardiac.
- Vascular.
- Cardiac catheterisation.
- Colorectal.
- Upper GI surgery.
- General surgery.
- Neurosurgery.
- Other surgery.
- Thoracic surgery.

CODE 23 Paediatric surgery

In paediatric hospitals the full range of service types should be used. That is, paediatric medical should be reported as medical and paediatric surgery should be reported as surgery.

CODE 24 Renal Medical

- Renal Medicine.
- Nephrology.
- Includes pre and post transplant treatment, support and education.
- Excludes dialysis and renal dialysis education. See code 21.

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Overdue patient
2	Other

Data element attributes

Collection and usage attributes

Guide for use:

This metadata item is required for patients in all *'Elective surgery waiting list episode – clinical urgency, code N'* categories. Overdue patients are those for whom the hospital system has failed to provide timely care and whose wait may have an adverse effect on the outcome of their care. They are identified by a comparison of *'Elective surgery waiting list episode – waiting time (at removal), total days N[NNN]'* or *'Elective surgery waiting list episode – waiting time (at a census date), total days N[NNN]'* and the maximum desirable time limit for the *'Elective surgery waiting list episode – clinical urgency, code N'* classification.

A patient is classified as overdue if ready for care and waiting time at admission or waiting time at a census date is longer than 30 days for patients in *'Elective surgery waiting list episode – clinical urgency, code N'* category 1, 90 days for patients in *'Elective surgery waiting list episode –*

clinical urgency, code N' category 2, or 365 days for patients in *'Elective surgery waiting list episode-clinical urgency, code N'* category 3.

4	Non-residential setting
5	Inpatient - designated palliative care unit or hospice
6	Inpatient - other than a designated palliative care unit
7	Outpatient - in a hospital/hospice

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Private residence

This may include a caravan, a mobile home, a houseboat or a unit in a retirement village.

CODE 2 Residential - aged care setting

Includes high and low care residential aged care facilities. Does not include units in a retirement village.

CODE 3 Residential - other setting

Includes a residential facility other than an aged care facility; a prison; or a community living environment including a group home. This code does not include inpatient settings e.g. hospitals and hospices.

CODE 4 Non-residential setting

Includes day respite centres and day centres. It does not include hospital outpatient departments.

CODE 5 Inpatient - designated palliative care unit or hospice

A dedicated ward or unit that receives identified funding for palliative care and/or primarily delivers palliative care. The unit may be a standalone unit (i.e. a hospice).

CODE 6 Inpatient - other than designated palliative care unit

Includes all beds not in a unit designated for palliative care. These are usually located in acute hospital wards. Excludes designated palliative care units.

CODE 7 Outpatient - in a hospital/hospice

Includes palliative care services provided at a hospital/hospice in an outpatient setting. Excludes all inpatient settings.

Collection methods: More than one code can be recorded.

Parity

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Female—parity, total N[N]

METeOR identifier: 302013

Registration status: Health, Standard 29/11/2006

Definition: The total number of previous pregnancies experienced by the woman that have resulted in a live birth or a stillbirth.

Data Element Concept: Female—parity

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Not stated

Unit of measure: Pregnancy

Data element attributes

Collection and usage attributes

Guide for use: This is to be recorded for each pregnancy.

This data element includes live births and stillbirths of 20 weeks gestation or 400 grams birthweight.

This data element excludes:

- the current pregnancy;
- pregnancies resulting in spontaneous or induced abortions before 20 weeks gestation; and
- ectopic pregnancies.

A primigravida (a woman pregnant for the first time) has a parity of 0.

Collection methods: A pregnancy with multiple fetuses is counted as one pregnancy.

Partner organisation type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Service provider organisation—partner organisation type, palliative care code N[N]
METeOR identifier:	290715
Registration status:	Health, Standard 05/12/2007
Definition:	The type of organisation with which a palliative care service provider organisation has formal working partnership(s) in place, as represented by a code.
Data Element Concept:	Service provider organisation—partner organisation type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

Permissible values:

Value	Meaning
1	Palliative care services
2	Hospitals
3	Community nursing agencies
4	Residential aged care facilities
5	Allied health services
6	Aboriginal health services
7	Medical practices
8	Integrated health centres
9	Universities/research centres
10	Volunteer support services
99	Other

Data element attributes

Collection and usage attributes

Guide for use: A formal working partnership involves arrangements between a service provider organisation and other service providers and organisations, aimed at providing integrated and seamless care, so that clients are able to move smoothly between services and service settings.

A formal working partnership is a verbal or written agreement between two or more parties. It specifies the roles and responsibilities of each party, including the expected outcomes of the agreement.

Key elements of a formal working partnership are that it is organised, routine, collaborative, and systematic. It excludes ad hoc arrangements. Examples of formal working partnerships include the existence of: written service agreements; formal liaison; referral and discharge planning processes; formal and routine consultation; protocols; partnership working groups; memoranda of understanding with other providers; and case conferencing.

Where partnerships exist for case conferencing purposes, record all partners involved.

CODE 1 Palliative care services

Includes services whose substantive work is with patients who have a life-limiting illness. These palliative care services may provide services in the community and/or in admitted patient settings (including hospices).

CODE 2 Hospitals

Includes emergency departments. Excludes hospices/designated palliative care units in a hospital, and other palliative care agencies as defined under Code 1. Also excludes hospital-based allied health services and individual medical practitioners.

CODE 7 Medical practices

Includes practices of general practitioners and individual specialist physicians such as specialists in palliative care, oncologists, urologists and neurologists.

CODE 8 Integrated health centres

Includes multipurpose centres, aged care centres and specialist care centres such as cancer centres.

CODE 9 Universities/research centres

Includes universities that may undertake research and development projects.

CODE 99 Other

Includes organisations based in the community such as schools, clubs, workplaces, organisations that provide respite care or pastoral care and 'Meals on wheels'.

Collection methods: More than one code can be recorded.

Patient days

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—number of patient days, total N[N(7)]
METeOR identifier:	270045
Registration status:	Health, Standard 01/03/2005
Definition:	The total number of days for all patients who were admitted for an episode of care and who separated during a specified reference period.
Data Element Concept:	Establishment—number of patient days

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N(7)]
Maximum character length:	8
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

A day is measured from midnight to 2359 hours.

The following basic rules are used to calculate the number of patient days for **overnight stay patients**:

- The day the patient is admitted is a patient day
- If the patient remains in hospital from midnight to 2359 hours count as a patient day
- The day a patient goes on leave is counted as a leave day
- If the patient is on leave from midnight to 2359 hours count as a leave day
- The day the patient returns from leave is counted as a patient day
- The day the patient is separated is not counted as a patient day.

The following additional rules cover special circumstances and in such cases, override the basic rules:

- Patients admitted and separated on the same date (**same-day patients**) are to be given a count of one patient day

- If the patient is admitted and goes on leave on the same day, count as a patient day
- If the patient returns from leave and goes on leave on the same date, count as a leave day.
- If the patient returns from leave and is separated, it is not counted as either a patient day or a leave day.
- If a patient goes on leave the day they are admitted and does not return from leave until the day they are discharged, count as one patient day (the day of admission is counted as a patient day, the day of separation is not counted as a patient day).

When calculating total patient days for a specified period:

- Count the total patient days of those patients separated during the specified period including those admitted before the specified period
- Do not count the patient days of those patients admitted during the specified period who did not separate until the following reference period
- Contract patient days are included in the count of total patient days. If it is a requirement to distinguish contract patient days from other patient days, they can be calculated by using the rules contained in the data element: total contract patient days.

Patient listing status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—patient listing status, readiness for care code N
METeOR identifier:	269996
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of the person's readiness to begin the process leading directly to being admitted to hospital for the awaited procedure, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—patient listing status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Ready for care
2	Not ready for care

Data element attributes

Collection and usage attributes

Guide for use:

A patient may be 'ready for care' or 'not ready for care'. Ready for care patients are those who are prepared to be admitted to hospital or to begin the process leading directly to admission. These could include investigations/procedures done on an outpatient basis, such as autologous blood collection, pre-operative diagnostic imaging or blood tests. Not ready for care patients are those who are not in a position to be admitted to hospital. These patients are either:

- staged patients whose medical condition will not require or be amenable to surgery until some future date; for example, a patient who has had internal fixation of a fractured bone and who will require removal of the fixation device after a suitable time; or
- deferred patients who for personal reasons are not yet prepared to be admitted to hospital; for example,

patients with work or other commitments which preclude their being admitted to hospital for a time.

Not ready for care patients could be termed staged and deferred waiting list patients, although currently health authorities may use different terms for the same concepts.

Staged and deferred patients should not be confused with patients whose operation is postponed for reasons other than their own unavailability, for example; surgeon unavailable, operating theatre time unavailable owing to emergency workload. These patients are still ‘ready for care’.

Periods when patients are not ready for care should be excluded in determining ‘Waiting time (at removal)’ and ‘Waiting time (at a census date)’.

Comments: Only patients ready for care are to be included in the National Minimum Data Set - Elective surgery waiting times. The dates when a patient listing status changes need to be recorded. A patient’s classification may change if he or she is examined by a clinician during the waiting period, i.e. undergoes **clinical review**. The need for clinical review varies with the patient’s condition and is therefore at the discretion of the treating clinician. The waiting list information system should be able to record dates when the classification is changed (metadata item Category reassignment date).

At the Waiting Times Working Group meeting on 9 September 1996, it was agreed to separate the metadata items Patient listing status, readiness for care and Clinical urgency as the combination of these items had led to confusion.

Patient present status (non-admitted patient)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Non-admitted patient service event—patient present status, code N

METeOR identifier: 270081

Registration status: Health, Standard 01/03/2005

Definition: The presence or absence of a patient at a service event, as represented by a code.

Data Element Concept: Non-admitted patient service event—patient present status

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Patient present with or without carer(s)/relative(s)
2	Carer(s)/relative(s) of the patient only

Data element attributes

Collection and usage attributes

Guide for use: A service event is regarded as having occurred when a consultation occurs between their carer/relative and a service provider at an appointment when the patient is not present, provided that the carer/relative is not a patient in their own right for the service contact. Where both are patients, it is considered that service events have been provided for the person(s) in whose medical record the service event is noted.

Patient relationship to health-care service provider

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—relationship to health-care service provider, code N
METeOR identifier:	330338
Registration status:	Health, Standard 07/12/2011
Definition:	The relationship of the patient to the health-care service provider, as represented by a code.
Data Element Concept:	Patient—relationship to health-care service provider

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Public admitted hospital patient
	2	Private admitted hospital patient
	3	Resident
	8	Other
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Public admitted hospital patient

'Public admitted hospital patient' includes persons enrolled in Medicare who, on admission to a recognised hospital or soon after, receive or elect to receive a public hospital service free of charge. This includes patients for whom treatment is contracted to a private hospital. It does not include Department of Veterans' Affairs patients and compensable patients. Code 1 also includes patients who were admitted to a private hospital as public patients.

CODE 2 Private admitted hospital patient

'Private admitted hospital patient' includes persons who on admission to a recognised hospital or soon after elect to be private patients treated by a medical practitioner of their choice; or elect to occupy a bed in a single room and are responsible for meeting certain hospital charges as well as the professional charges raised by a treating medical or dental practitioner. Private admitted hospital patients also includes persons who are eligible for Medicare who choose to be admitted to a private hospital and are responsible for meeting all hospital charges as well as the professional charges raised by any treating medical or dental practitioner.

Private admitted hospital patient also includes:

- Department of Veterans' Affairs patients (eligible persons whose charges for their hospital admission are met by the Department of Veterans' Affairs); and
- Compensable patients (persons who are entitled to receive or have received a compensation payment with respect to an injury or disease). Compensable patients are persons who are entitled to claim damages under motor vehicle third party insurance, worker's compensation, public liability or common law.

Whether patients are admitted patients will depend on administrative practices within particular jurisdictions. If the patients were considered to be admitted patients by the relevant health-service provider at the time of the health-care incident then Code 1 or 2 should be recorded (as appropriate). Code 1 or 2 should also be used for patients receiving long-term nursing or respite care in a hospital, if they are considered admitted hospital patients.

CODE 3 Resident

'Resident' should be recorded where, at the time of the incident, a patient was a resident in a residential aged care or mental health care establishment, or in a similar residential health-care setting. Some hospitals (particularly in rural areas) use hospital beds to provide long-term nursing or respite care. However, where patients receiving such care are admitted hospital patients this code should not be recorded.

CODE 8 Other

'Other' should be recorded where, at the time of the incident, the patient was attending an outpatient clinic, general practice surgery, Emergency department, or similar non-admitted, non-residential service.

CODE 9 Not stated/inadequately described

'Not stated/inadequately described' should be used when the information is not currently available.

Data element attributes

Collection and usage attributes

Comments: The coding category definitions were developed with reference to the following metadata items in the National Health Data Dictionary Version 15: Admitted patient election status; Compensable status; Funding source for hospital patient; and Medicare eligibility status (AIHW 2010).

This data element distinguishes between public and private admitted hospital patients only as it is difficult to distinguish between public and private non-admitted hospital patients, and the relevant NHDD data elements all apply to hospital patients only. Also, national data on numbers of hospital separations for public and private patients are available, whereas similar denominator data are not readily available for non-admitted patients.

Patients in residence at year end

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—patients/clients in residence at year end, total N[NNN]

METeOR identifier: 270046

Registration status: Health, Standard 01/03/2005

Definition: A headcount of all formally admitted patients/clients in residence in long-stay facilities.

Data Element Concept: Establishment—patients/clients in residence at year end

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNN]

Maximum character length: 4

Unit of measure: Person

Data element attributes

Collection and usage attributes

Collection methods: For public psychiatric hospitals and alcohol and drug hospitals, all states have either an annual census or admission tracking that would enable a statistical census. The Commonwealth Department of Health and Ageing is able to carry out a statistical census from its residential aged care service databases.

A headcount snapshot could be achieved either by census or by the admission/discharge derivation approach.

There are difficulties with the snapshot in view of both seasonal and day of the week fluctuations. Most of the traffic occurs in a small number of beds.

Any headcount should avoid the problems associated with using 31 December or 1 January. The end of the normal financial year is probably more sensible (the Wednesday before the end of the financial year was suggested, but probably not necessary). This should be qualified by indicating that the data does not form a time series in its own right.

Comments: The number of separations and bed days for individual long-stay establishments is often a poor indication of the services provided. This is because of the relatively small number of separations in a given institution. Experience has shown that the number of patients/clients in residence can often give a more reliable picture of the levels of services being provided.

Percutaneous coronary intervention procedure type

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—percutaneous coronary intervention procedure type, code N
Synonymous names:	PCI procedure type
METeOR identifier:	359751
Registration status:	Health, Standard 01/10/2008
Definition:	The type of procedure performed during a percutaneous coronary intervention (PCI), as represented by a code.
Data Element Concept:	Person—percutaneous coronary intervention procedure type

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	String	
Format:	N	
Permissible values:	Value	Meaning
	1	Balloon angioplasty only
	2	Bare metal stent implantation
	3	Drug-eluting stent implantation
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1   Balloon angioplasty only

Use this code where only balloon angioplasty has been performed during a percutaneous coronary intervention.

CODE 2   Bare metal stent implantation

Use this code where a bare metal stent has been implanted during a percutaneous coronary intervention.

CODE 3   Drug-eluting stent implantation

Use this code where at least one drug-eluting stent has been implanted during a percutaneous coronary intervention (i.e. if more than one stent has been placed during the procdure and at least one stent is a drug-eluting stent).

CODES 2 and 3 include the performance of balloon angioplasty.

Perineal status

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Female (mother)—postpartum perineal status, code N

METeOR identifier: 269939

Registration status: Health, Standard 01/03/2005

Definition: The state of the perineum following birth, as represented by a code.

Context: Perinatal

Data Element Concept: Female (mother)—postpartum perineal status

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Intact
	2	1st degree laceration/vaginal graze
	3	2nd degree laceration
	4	3rd degree laceration
	5	Episiotomy
	6	Combined laceration and episiotomy
	7	4th degree laceration
	8	Other
Supplementary values:	9	Not stated

Collection and usage attributes

Guide for use: Vaginal tear is included in the same group as 1st degree laceration to be consistent with ICD-10-AM code. Other degrees of laceration are as defined in ICD-10-AM.

Comments: While 4th degree laceration is more severe than an episiotomy it has not been placed in order of clinical significance within the data domain. Instead it has been added to the data domain as a new code rather than modifying the existing order of data domain code values. This is because information gatherers are accustomed to the existing order of the codes. Modifying the existing order may result in miscoding of data. This approach is consistent with established practice in classifications wherein a new data domain identifier (or code number) is assigned to any new value meaning that occurs, rather than assigning this new value domain meaning to an existing data domain identifier.

Data element attributes

Collection and usage attributes

Comments: Perineal laceration (tear) may cause significant maternal morbidity in the postnatal period. Episiotomy is an indicator of management during labour and, to some extent, of intervention rates.

Definition:	Length of time in years a person has lived in Australia.
Data Element Concept:	Person—period of residence in Australia

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	String	
Format:	NN	
Maximum character length:	2	
Permissible values:	Value	Meaning
	00	Under one year residence in Australia
	01-97	1 to 97 years residence in Australia
	98	Born in Australia
Supplementary values:	99	Unknown

Data element attributes

Collection and usage attributes

Collection methods:

This information may be obtained either from:

- a direct question with response values as specified in the data domain; or
- derived from other questions about date of birth, birthplace and year of arrival in Australia.

Comments:

This metadata item was included in the recommended second-level data set by the National Committee on Health and Vital Statistics (1979) to allow analyses relating to changes in morbidity patterns of ethnic subpopulations related to length of stay in host country; for example, cardiovascular disease among Greek immigrants in Australia.

This item was not considered a high priority by the Office of Multicultural Affairs (1988) and to date only the country of birth and Indigenous status are considered by the National Health Data Committee to be justified for

	inclusion in the National Minimum Data Set - Admitted patient care.

Peripheral neuropathy (status)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—peripheral neuropathy indicator, code N

METeOR identifier: 302457

Registration status: Health, Standard 21/09/2005

Definition: Whether peripheral neuropathy is present, as represented by a code.

Data Element Concept: Person—peripheral neuropathy indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use: CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes: Record if peripheral neuropathy is present in the person.

CODE 2 No: Record if peripheral neuropathy is not present in the person.

Record whether or not peripheral neuropathy is present determined by clinical judgement following assessment using pinprick and vibration (using perhaps a Biothesiometer) or Monofilament.

Collection methods: Examine for neuropathy by testing reflexes and sensation preferably using tuning fork (standard vibration fork 128 hz), pinprick, 10g monofilament and/or biothesiometer.

The preferred assessment methods are monofilament and biothesiometer. These two non-invasive tests provide more objective and repeatable results than testing sensation with pinprick or a tuning fork, which are very difficult to standardise.

1 The 'Touch-Test' Sensory Evaluation (Semmens-Weinstein Monofilaments) application guidelines:

- Occlude the patient's vision by using a shield or by having the patient look away or close his or her eyes.
- Instruct the patient to respond when a stimulus is felt by saying 'touch' or 'yes'.
- Prepare to administer the stimulus to the foot (dorsal or plantar surface).
- Press the filament of the Touch
- Test at a 90 degree angle against the skin until it bows. Hold in place for approximately 1.5 seconds and then remove.

To assure the validity of the sensory test findings:

- The patient must not be able to view the administration of the stimuli so that false indications are avoided.
- The nylon filament must be applied at a 90 degree angle against the skin until it bows for approximately 1.5 second before removing.
- If the patient does not feel the filament, then protective pain sensation has been lost.

2 Testing vibration sensation with a biothesiometer - application guidelines:

- The biothesiometer has readings from 0 to 50 volts. It can be made to vibrate at increasing intensity by turning a dial.
- A probe is applied to part of the foot, usually on the big toe.
- The person being tested indicates as soon as he/she can feel the vibration and the reading on the dial at that point is recorded.

The reading is low in young normal individuals (i.e. they are very sensitive to vibration). In older individuals, the biothesiometer reading becomes progressively higher. From experience, it is known that the risk of developing a neuropathic ulcer is much higher if a person has a biothesiometer reading greater than 30-40 volts.
