Collection and usage attributes

Guide for use:

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes: Record if peripheral vascular disease is present in either foot.

CODE 2 No: Record if peripheral vascular disease is not present in either foot.

Collection methods:

If it is mild, peripheral vascular disease can be completely without symptoms. However, compromised blood supply in the long term could cause claudication (pain in the calf after walking for a distance or up an incline or stairs), rest pain or vascular ulceration.

Physical examination is necessary to assess the peripheral vascular circulation. Purplish colour and cold temperature of feet are indications to suspect that the circulation may be impaired.

Palpate pulses:

The simplest method to estimate blood flow and to detect ischaemia to the lower extremities is palpation of the foot pulses (posterior tibial and dorsalis pedis arteries) in both feet. Note whether pulses are present or absent. If pulses in the foot can be clearly felt, the risk of foot ulceration due to vascular disease is small.

Test capillary return:

A helpful confirmation sign of arterial insufficiency is pallor of the involved feet after 1 - 2 min of elevation if venous filling time is delayed beyond the normal limit of 15 sec.

Doppler probe:

If pulses cannot be palpated, apply a small hand-held Doppler, placed over the dorsalis pedis or posterior tibial arteries to detect pulses, quantify the vascular supply and listen to the quality of the signal.

When the foot pulses are very weak or not palpable, the risk assessment could be completed by measuring the ankle brachial index (ankle pressure/ brachial pressure). Normal ankle brachial index is 0.9 - 1.2. An ankle brachial index less than 0.6 indicates compromised peripheral circulation.

Pharmacotherapy type prescribed for acute coronary syndrome in hospital

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with acute coronary syndrome—pharmacotherapy type prescribed in hospital, code N[N]
Synonymous names:	ACS pharmacotherapy type prescribed
METeOR identifier:	344344
Registration status:	Health, Standard 01/10/2008
Definition:	The type of pharmacotherapy prescribed to a person in hospital for the treatment of acute coronary syndrome, as represented by a code.
Data Element Concept:	Person with acute coronary syndrome—pharmacotherapy type prescribed in hospital

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

Permissible values:	Value	Meaning
	1	Aspirin
	2	Angiotensin converting enzyme (ACE) inhibitor
	3	Angiotensin II receptor blocker
	4	Antithrombin
	5	Beta-blocker
	6	Clopidogrel
	7	Fibrinolytic
	8	Glycoprotein IIb/IIIa receptor antagonist
	9	Statin
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Aspirin

Includes: aspirin, astrix, cardiprin, cartia, aspro, disprin and solprin

CODE 2 Angiotensin converting enzyme (ACE) inhibitor

Includes: captopril, enalapril, fosinopril, lisinopril, perindopril, quinapril, ramipril and trandolapril

CODE 3 Angiotensin II receptor blocker

Includes: candesartan, eprosartan, irbesartan, losartin and temisartan

CODE 4 Antithrombin

Includes: dalteparin, danaparoid, enoxaparin, heparin, phenindione, warfarin, bivalirudin, fondaparinux, lepirudin

CODE 5 Beta-blocker

Includes: atenolol, bisoprolol, carvedilol, esmolol, labetolol, metoprolol, oxprenolol, pindolol, propranolol and sotalol

CODE 6 Clopidogrel

Includes: iscover and plavix

CODE 7 Fibrinolytic

Includes: streptokinase, tissue plasminogen activator (t-PA) (alteplase), reteplase (r-PA) and tenecteplase (TNK t-PA)

CODE 8 Glycoprotein IIb/IIIa receptor

Includes: abciximab, eptifibatide and tirofiban

CODE 9 Statin

Includes: atorvastatin, fluvastatin, pravastatin and simvastatin

Data element attributes

Collection and usage attributes

Guide for use: A person may be prescribed one or more type of medication for acute coronary syndromes. Therefore more than one code may be recorded.

Collection methods: This information should be recorded at the end of the person's hospital stay involving the treatment of acute coronary syndromes.

Comments: The purpose of this data element is to collect information on the prescription of pharmacotherapy recommended for the treatment of acute coronary syndromes in the national guidelines. Additional information on the specific drug types prescribed is not required for this quality purpose.

The health service may choose to collect additional information on the specific drug types prescribed within each of the core pharmacotherapies.

CODE 5 Clopidogrel

Includes: iscover and plavix

CODE 6 Statin

Includes: atorvastatin, fluvastatin, pravastatin and simvastatin

Data element attributes

Collection and usage attributes

Guide for use: A person may be taking one or more type of medication for acute coronary syndromes (ACS). Therefore more than one code may be recorded.

Collection methods: Following a person's hospital stay for ACS, follow-up consultations with a clinician may occur at various intervals, such as 3, 6 or 12 months after discharge from hospital. The medications being taken by the person at the time of each follow-up consultation should be recorded.

Comments: The pharmacotherapies for the treatment of ACS that could be taken post discharge from hospital are different from the types that could be taken during the hospital stay as not all of the pharmacotherapies used for the treatment of ACS are for out of hospital use.

Physical activity sufficiency status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—physical activity sufficiency status, code N
METeOR identifier:	270054
Registration status:	Health, Standard 01/03/2005
Definition:	Sufficiency of moderate or vigorous physical activity to confer a health benefit, as represented by a code.
Data Element Concept:	Person—physical activity sufficiency status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Sufficient
	2	Insufficient
	3	Sedentary
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

The clinician makes a judgment based on assessment of the person's reported physical activity history for a usual 7-day period where:

CODE 1:

Sufficient physical activity for health benefit for a usual 7-day period is calculated by summing the total minutes of walking, moderate and/or vigorous physical activity.

Vigorous physical activity is weighted by a factor of two to account for its greater intensity. Total minutes for health benefit need to be equal to or more than 150 minutes per week.

CODE 2:

Insufficient physical activity for health benefit is where the sum of the total minutes of walking, moderate and/or vigorous physical activity for a usual 7-day period is less than 150 minutes but more than 0 minutes.

CODE 3:

Sedentary is where there has been no moderate and/or vigorous physical activity during a usual 7-day period.

CODE 9:

There is insufficient information to more accurately define the person's physical activity sufficiency status or the information is not known.

Note: The National Heart Foundation of Australia and the National Physical Activity Guidelines for Australians describes moderate-intensity physical activity as causing a slight but noticeable, increase in breathing and heart rate and suggests that the person should be able to comfortably talk but not sing. Examples of moderate physical activity include brisk walking, low pace swimming, light to moderate intensity exercise classes. Vigorous physical activity is described as activity, which causes the person to 'huff and puff', and where talking in a full sentence between breaths is difficult.

Examples of vigorous physical activity include jogging, swimming (freestyle) and singles tennis.

Comments:

The above grouping subdivides a population into three mutually exclusive categories.

A sufficiently physically active person is a person who is physically active on a regular weekly basis equal to or in excess of that required for a health benefit. Sufficient physical activity for health results from participation in physical activity of adequate duration and intensity. Although there is no clear absolute threshold for health benefit, the accrual of 150 minutes of moderate (at least) intensity physical activity over a period of one week is thought to confer health benefit. Walking is included as a moderate intensity physical activity. Note that the 150 minutes of moderate physical activity should be made up of 30 minutes on most days of the week and this can be accumulated in 10 minute bouts (National Physical Activity Guidelines for Australians).

Health benefits can also be obtained by participation in vigorous physical activity, in approximate proportion to the total amount of activity performed, measured either as energy expenditure or minutes of physical activity (Pate et al. 1995).

Physical activity - health benefit for vigorous physical activity is calculated by:

- incorporating a weighted factor of 2, to account for its greater intensity
- summing the total minutes of walking, moderate

and/or vigorous physical activity will then give an indication if a health benefit is likely.

Insufficient physical activity describes a person who engages in regular weekly physical activity but not to the level required for a health benefit through either moderate or vigorous physical activity.

A sedentary person is a person who does not engage in any regular weekly physical activity.

Data element attributes

Collection and usage attributes

Guide for use:

Australia Post maintains a Postal Address File (PAF) database which contains Australian postal delivery addresses and their corresponding eight (8) character unique identification number known as a Delivery Point Identifier (DPID). While the PAF is concerned with postal address, for many persons' a postal address will be the same as their residential address. The PAF can be used to improve the recording of address data at the time of data collection.

The Postal Address File may be used at the time of data collection to confirm that the combined metadata items of address line, suburb/town/locality, Australian state/territory identifier and postcode - Australian are accurately recorded.

Collection methods: The Delivery Point Identifier (DPID) is assigned electronically to recognised Australia Post delivery addresses following reference to the Postal Address File (PAF) database.

Comments: In October 1999, Australia Post introduced a bar-coding system for bulk mail lodgements. Agencies or establishments can use software to improve the quality of person address data it collects and records and, at the same time, receive financial benefits by reducing its postage expenses.

The DPID is easily converted to a bar code and can be included on correspondence and address labels. If the bar code is displayed on a standard envelope that passes through a mail-franking machine (e.g. as used by most major hospitals), the postage cost is reduced. Every three months, Australia Post provides updates to the PAF database. For more information, contact Australia Post.

Data Element Concept:	Person (address)—postal delivery service type identifier

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	String
Format:	[X(11)]
Maximum character length:	11

Data element attributes

Collection and usage attributes

Guide for use:

The identification of a postal delivery service may be composed of a prefix, a number, and a suffix as per the following format:

Prefix A(3)

Number N(5)

Suffix A(3)

May optionally include a prefix and suffix which are non-numeric.

The identification may also not be required for certain services.

Examples:

PO BOX C96

CARE PO

RMB 123

GPO BOX 1777Q

Collection methods:

To be collected in conjunction with Postal delivery service type - abbreviation.

Source and reference attributes

Origin: Health Data Standards Committee

Postpartum complication

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Birth event—complication (postpartum), code (ICD-10-AM 7th edn) ANN{.N[N]}

METeOR identifier: 391336

Registration status: Health, Standard 22/12/2009

Definition: Medical and obstetric complications of the mother occurring during the postnatal period up to the time of separation from care, as represented by a code.

Data Element Concept: Birth event—complication (postpartum)

Value domain attributes

Representational attributes

Classification scheme: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition

Representation class: Code

Data type: String

Format: ANN{.N[N]}

Maximum character length: 6

Collection and usage attributes

Guide for use: Complications and conditions should be coded within the Pregnancy, Childbirth, Puerperium chapter 15 of Volume 1, ICD-10-AM.

Data element attributes

Collection and usage attributes

Guide for use: There is no arbitrary limit on the number of conditions specified.

Comments: Examples of such conditions include postpartum haemorrhage, retained placenta, puerperal infections, puerperal psychosis, essential hypertension, psychiatric disorders, diabetes mellitus, epilepsy, cardiac disease and chronic renal disease.

Complications of the puerperal period may cause maternal morbidity, and occasionally death, and may be an important factor in prolonging the duration of hospitalisation after childbirth.

Source and reference attributes

Preferred language

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—preferred language, code (ASCL 2011) NN{NN}
METeOR identifier:	460123
Registration status:	Community Services, Standard 13/10/2011 Housing assistance, Standard 13/10/2011 Health, Standard 13/10/2011 Homelessness, Standard 13/10/2011
Definition:	The language (including sign language) most preferred by the person for communication, as represented by a code.
Data Element Concept:	Person—preferred language

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Classification of Languages 2011
Representation class:	Code
Data type:	Number
Format:	NN{NN}
Maximum character length:	4

Collection and usage attributes

Guide for use:

The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure. The most detailed level of the classification consists of base units (languages) which are represented by four-digit codes. The second level of the classification comprises narrow groups of languages (the Narrow group level), identified by the first two digits. The most general level of the classification consists of broad groups of languages (the Broad group level) and is identified by the first digit. The classification includes Australian Indigenous languages and sign languages.

For example, the Lithuanian language has a code of 3102. In this case 3 denotes that it is an Eastern European language, while 31 denotes that it is a Baltic language. The Pintupi Aboriginal language is coded as 8713. In this case 8 denotes that it is an Australian Indigenous language and 87 denotes that the language is a Western Desert language.

Language data may be output at the Broad group level, Narrow group level or base level of the classification. If necessary, significant languages within a Narrow group can be presented separately while the remaining languages in the Narrow group are aggregated. The same principle can be adopted to highlight significant Narrow groups within a Broad group.

Data element attributes

Collection and usage attributes

Guide for use: This may be a language other than English even where the person can speak fluent English.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Pregnancy duration at the first antenatal care visit

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Pregnancy—estimated duration (at the first visit for antenatal care), completed weeks N[N]

Synonymous names: Estimated pregnancy gestation in completed weeks at the first visit for antenatal care.

METeOR identifier: 379597

Registration status: Health, Standard 02/12/2009

Definition: The total number of completed weeks of a pregnancy's estimated duration on the day of the first visit for antenatal care.

Data Element Concept: Pregnancy—estimated duration

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Not stated/unknown

Unit of measure: Completed weeks

Data element attributes

Collection and usage attributes

Guide for use: The day of the first visit for antenatal care is the day of the first contact with a midwife, medical practitioner, or other recognised health professional where antenatal care was provided. It does not include a contact if it was to confirm the pregnancy only or those contacts that occurred during the pregnancy that related to other non pregnancy related issues. It does not include a first contact after the onset of labour.

Antenatal care visits are attributed to the pregnant woman. The duration of the pregnancy on that day is the same as the gestational age of the fetus or baby on that day.

Collection methods: To be collected at any time during the pregnancy or birth episode after the best estimate of gestational age has been determined.

The method of data collection will usually be from health records of pregnancy and/or birth.

The valid range of completed weeks for Pregnancy duration at the first visit for antenatal care is 3-46.

Previous pregnancies—ectopic

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Female—number of previous pregnancies (ectopic), total N[N]

METeOR identifier: 269936

Registration status: Health, Standard 01/03/2005

Definition: The total number of previous pregnancies of a female resulting in ectopic pregnancy.

Data Element Concept: Female—number of previous pregnancies

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Not stated

Unit of measure: Pregnancy

Data element attributes

Collection and usage attributes

Guide for use: A pregnancy resulting in multiple births should be counted as once pregnancy.

In multiple pregnancies with more than one type of outcome, the pregnancies should be recorded in the following order:

- all live births
- stillbirth
- spontaneous abortion
- induced abortion
- ectopic pregnancy

Where the outcome was one stillbirth and one live birth, count as stillbirth.

If a previous pregnancy was a hydatidiform mole, code as spontaneous or induced abortion (or rarely, ectopic pregnancy), depending on the outcome.

Comments: The number of previous pregnancies is an important component of the woman's reproductive history. Parity may be a risk factor for adverse maternal and perinatal outcomes.

Source and reference attributes

Submitting organisation: National Perinatal Data Development Committee

Previous specialised treatment

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Patient—previous specialised treatment, code N
METeOR identifier:	270374
Registration status:	Health, Standard 01/03/2005
Definition:	Whether a patient has had a previous **admission** or service contact for treatment in the specialty area within which treatment is now being provided, as represented by a code.
Data Element Concept:	Patient—previous specialised treatment

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Patient has no previous admission(s) or service contact(s) for the specialised treatment now being provided
	2	Patient has previous hospital admission(s) but no service contact(s) for the specialised treatment now being provided
	3	Patient has previous service contact(s) but no hospital admission(s) for the specialised treatment now being provided
	4	Patient has both previous hospital admission(s) and service contact(s) for the specialised treatment now being provided
Supplementary values:	5	Unknown/not stated

Collection and usage attributes

Guide for use:

CODE 1 Patient has no previous admission(s) or service contact(s) for the specialised treatment now being provided

Use this code for admitted patients, whose only prior specialised treatment contact was the service contact that referred the patient for admission.

CODES 2-4 These codes include patients who have been seen at any time in the past within the speciality within which the patient is currently being treated (mental health or palliative care), regardless of whether it was part of the current episode or a previous admission/service contact many years in the past. Use these codes regardless of whether the previous treatment was provided within the service in which the person is now being treated, or another equivalent specialised service (either institutional or community-based).

CODE 2 Patient has previous hospital admission(s) but no service contact(s) for the specialised treatment now being provided

CODE 3 Patient has previous service contact(s) but no hospital admission(s) for the specialised treatment now being provided

CODE 4 Patient has both previous hospital admission(s) and service contact(s) for the specialised treatment now being provided

Data element attributes

Collection and usage attributes

Comments: This metadata item was originally developed in the context of mental health institutional care data development (originally metadata item Problem status and later First admission for psychiatric treatment). More recent data development work, particularly in the area of palliative care, led to the need for this item to be re-worded in more generic terms for inclusion in other data sets.

For palliative care, the value of this data element is in its use in enabling approximate identification of the number of new palliative care patients receiving specialised treatment. The use of this data element in this way would be improved by the reporting of this data by community-based services.

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Reference documents: WHO (World Health Organization) 2003. International Classification of Functioning, Disability and Health (ICF). Geneva: WHO

Data element attributes

Collection and usage attributes

Guide for use: This data element should be used in conjunction with the data element: *Patient—additional body function or structure affected, body function or structure code N[N]* to provide information on the nature of the harm alleged to have resulted from a health-care incident.

Only one primary body function or structure may be selected.

The primary body function or structure affected should be that which has the greatest impact on the patient.

Where this impact is psychological it should be recorded as Code 1 'Mental functions or structures of the nervous system'.

Where the patient experiences pain as a result of the health-care incident, record the code for the body structure with which the pain is most closely associated. Where the pain experienced by the patient as a result of the health-care incident is deemed to be more disabling than the associated physical or mental damage to the patient, then record Code 2 'Sensory functions and pain of the eye, ear and related structures'.

In the case of cancer primarily affecting a single organ or body part, the appropriate code for that organ or body part should be recorded. Where the cancer has progressed and affects major body systems, Code 4 'Functions or structures of the cardiovascular, haematological, immunological and respiratory systems' should be recorded. This rule should also be followed for other conditions affecting major body systems.

Comments: This data element is fully aligned with the Australian Prudential Regulation Authority (2006) National Claims and Policies Database, data item 16. 'Body functions or structures affected'.

Collection and usage attributes

Guide for use:

CODE 10 Diagnosis

'Diagnosis' includes missed, delayed or incorrect diagnosis.

'Medication-related' is defined to cover the use of drugs and other medicines in the delivery of health services, including immunisations; excludes 'anaesthetic' and 'blood or blood product-related'.

CODE 20 Medication-related: type and dosage

'Medication-related: type and dosage' includes issues related to type of medication or its dosage.

CODE 21 Medication-related: method of administration

'Medication-related: method of administration' includes issues related to method of administration of medication.

CODE 22 Medication-related: other or not further defined

'Medication-related: other or not further defined' includes any medication-related issues other than type, dosage or method of administration. Examples include medication not provided and a patient's reaction to a correctly prescribed and administered medication.

CODE 30 Anaesthetic

'Anaesthetic' includes all issues related to epidural, anaesthetic substances, equipment, monitoring or resuscitation and patient awareness.

'Procedure' is defined as an invasive clinical intervention, where there is an incision and/or the body cavity is entered; procedures may be therapeutic or diagnostic. A vaginal delivery is also considered a procedure for the purposes of this metadata item.

CODE 51 Procedure—wrong procedure

'Procedure—wrong procedure' includes unnecessary procedures, for example, removal of a healthy appendix.

CODE 53 Procedure—post-operative complications

'Procedure—post-operative complications' includes incidents involving unintentionally retained objects following a procedure.

CODE 56 Procedure—post-operative infection

'Procedure—post-operative infection' includes wound infection due to a procedure; excludes hospital-acquired infections, for example, post-operative sepsis, needlestick injuries and claims involving failure to properly sterilise equipment.

CODE 57 Procedure—intra-operative complications

'Procedure—intra-operative complications' includes complications that arise during the course of a procedure, for example unintended perforations of adjacent organs.

CODE 59 Procedure—other or not further defined

'Procedure—other or not further defined' includes alleged negligent procedure (where no further information is available).

'Treatment' refers to health-care acts other than 'medication-related', 'anaesthetic', 'blood or blood product-related (includes blood transfusions)' or 'procedure'. Examples of treatment include applying a dressing to a wound, setting a broken bone, physiotherapy services and psychiatric counselling for mental health patients.

CODE 61 Treatment—not provided

'Treatment—not provided' includes, for example, where an ambulance is called to attend but does not arrive, where a patient's condition deteriorates after the patient elects to leave or is turned away from a medical facility, or where a patient is not provided with the diet required by the patient's condition.

CODE 62 Treatment—complications

'Treatment—complications' includes, for example, developing ulcers under a plaster or dressing or a bone fractured during physiotherapy treatment, or where the failure to clean a wound sustained from an injury results in infection.

CODE 63 Treatment—failure of treatment

'Treatment—failure of treatment' includes incorrectly setting a broken bone.

CODE 64 Treatment—other or not further defined

'Treatment—other or not further defined' includes any incident or allegation of treatment as defined here, which does not fall under the treatment subcategories listed above.

CODE 70 Consent (includes failure to warn)

‘Consent (includes failure to warn)’ includes no valid consent and failure to warn, cessation or continuation of treatment without consent or against patient’s stated wishes, and disposing of a fetus without the consent of the parents.

CODE 80 Infection control (includes instrument sterilisation)

‘Infection control (includes instrument sterilisation)’ includes hospital-acquired infections, for example, post-operative sepsis, needlestick injuries and claims involving failure to properly sterilise equipment, but excluding post-operative infection.

CODE 90 Device failure (includes problems with implanted devices)

‘Device failure (includes problems with implanted devices)’ includes device failure during insertion and the insertion procedure is consequently aborted. Excludes problems due to the surgical implantation procedure.

CODE 100 Other general duty of care issues

‘Other general duty of care issues’ includes falls, administrative errors, for example, placing a ‘nil by mouth’ sign on the bed of the wrong patient, and patient monitoring and follow-up issues.

CODE 888 Other

‘Other’ includes medico-legal reports, disciplinary enquiries and other legal issues, breach of confidentiality, record keeping or loss of documents, and harassment and discrimination.

CODE 999 Not stated/inadequately described

‘Not stated/inadequately described’ should be used when the information is not currently available.

Comments: The definition of ‘Procedure’ used in the Medical indemnity data set specification was agreed to by the MIDWG during the data development phase of the MINC. This definition is narrower than the definition of ‘Procedure’ used in the National Health Data Dictionary METeOR identifier 391349.

Data element attributes

Collection and usage attributes

Guide for use:

Only one code may be selected for this data element.

The code recorded as the primary incident or allegation type should be that which best reflects the main, dominant or primary cause giving rise to a medical indemnity claim.

Where a series of events contributed to the incident that gave rise to a medical indemnity claim, and it is difficult to identify the primary incident or allegation type the first event in the series should be coded.

Comments:

The coding categories for this data element have been developed with reference to a range of classifications currently in use, among which there is a high degree of commonality in terms of the categories identified. At the time of developing this data element a list of 46 categories of ‘clinical incident category alleged in claim’ was used in New South Wales to record this information. This list was also adopted for use in Tasmania. In Western Australia eight broad ‘incident type’ categories were used to collect this information on clinical incident notification forms. Two studies of the epidemiology of adverse events (one Australian and one from the United States of America) used similar, broad categories of the nature of adverse events to analyse data (Thomas et al. 2000; Wilson et al. 1995).

There is concordance between the Australian Prudential Regulation Authority (2006) National Claims and Policies Database claims data item 15 ‘Cause of loss’ and the Medical Indemnity National Collection data item (AIHW 2011).

Classification scheme:	International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition
Representation class:	Code
Data type:	String
Format:	ANN{.N[N]}
Maximum character length:	6

Collection and usage attributes

Guide for use: Report the primary site of cancer, if known, for patients who have been diagnosed with a cancer.

Source and reference attributes

Reference documents: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision (ICD-10)

Data element attributes

Collection and usage attributes

Collection methods: In a hospital setting, primary site of cancer should be recorded on the patient's medical record by the patient's attending clinician or medical practitioner, and coded by the hospital's medical records department.

Hospitals use Diagnosis codes from ICD-10-AM (7th edition). Valid codes must start with C or D.

In hospital reporting, the diagnosis code for each separate primary site cancer will be reported as a Principal diagnosis or an Additional diagnosis as defined in the current edition of the Australian Coding Standards. In death reporting, the Australian Bureau of Statistics uses ICD-10.

Some ICD-10-AM (7th edition) diagnosis codes e.g. mesothelioma and Kaposi's sarcoma, are based on morphology and not site alone, and include tumours of these types even where the primary site is unknown.

Primary site of cancer (ICD-O-3 code)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—primary site of cancer, topography code (ICD-O-3) ANN.N

METeOR identifier: 396090

Registration status: Health, Standard 07/12/2011

Definition: The site in which the tumour originated in a person with cancer, as opposed to the secondary or metastatic sites, as represented by a code.

Data Element Concept: Person with cancer—primary site of cancer

Value domain attributes

Representational attributes

Classification scheme: International Classification of Diseases for Oncology 3rd edition

Representation class: Code

Data type: String

Format: ANN.N

Maximum character length: 5

Collection and usage attributes

Guide for use: Record all four alphanumeric characters of the topography code. The number after the decimal point represents the subsite or subcategory.

Data element attributes

Collection and usage attributes

Guide for use: Record the primary site of cancer, if known, for patients who have been diagnosed with cancer. When the primary site is unknown, record C80.9.

The primary site of the tumour is the site of origin, as opposed to the secondary or metastatic site.

Record all four alphanumeric characters of the topography code. The number after the decimal point represents the subsite or subcategory.

Refer to the coding guidelines for topography in ICD-O-3, pp 23-26.

Refer to the coding guidelines for multiple tumours in ICD-O-3, pp 35-37.

If the patient is diagnosed with more than one primary tumour, record the site of each primary separately.

If the primary site differs on multiple pathology or other notification reports for the same tumour, use the most specific value. For example, one report may state the breast (C50.9) is the site of the primary while another report records the lower-inner quadrant of the breast (C50.3) as the primary site; record C50.3 here as the primary site.

Collection methods: This information should be obtained from the patient's medical record.

Comments: The information is collected so that tumours can be classified into clinically relevant groups based on their primary site and histological type. This provides a basis for staging and the determination of treatment options. The primary site of the cancer also affects the course of the disease and prognosis.

Collection and usage attributes

Guide for use:

CODE 13 Dentistry

'Dentistry' excludes oral and maxillofacial surgery.

CODE 15 Diagnostic radiology

'Diagnostic radiology' includes diagnostic ultrasound.

CODE 16 Otolaryngology

'Otolaryngology' includes ear, nose, throat, head and neck surgeons.

CODE 22 General medicine

'General medicine' includes general and internal medicine physicians and endoscopy.

CODE 25 General surgery

'General surgery' includes surgical procedures, including colorectal surgery.

CODE 27 Gynaecology only

'Gynaecology only' includes gynaecologists who only diagnose, treat and aid in the prevention of disorders of the female reproductive system (RANZCOG 2011).

CODE 31 Midwifery

'Midwifery' includes registered midwives only.

CODE 35 Nuclear medicine

'Nuclear medicine' includes radiotherapy and radiation oncology.

CODE 36 Nursing–general

'Nursing-general' includes enrolled and registered nurses.

CODE 37 Nursing–nurse practitioner

'Nursing–nurse practitioner' includes registered nurse practitioners only.

CODE 39 Obstetrics and gynaecology

'Obstetrics and gynaecology' includes specialists who carry out gynaecological examinations, diagnosis and operations on women; provide medical care before, during and after childbirth; and treat infertility by chemical or operative measures (RANZCOG 2011).

CODE 40 Obstetrics only

'Obstetrics only' includes obstetricians who only provide medical care before, during and after childbirth (RANZCOG 2011).

CODE 41 Occupational and environmental medicine

'Occupational and environmental medicine' should be used for doctors only; occupational therapists should be recorded at Code 67.

CODE 46 Paediatrics

'Paediatrics' excludes neonatal or perinatal medicine and paediatric surgery.

CODE 49 Pathology

'Pathology' includes general pathology, anatomical pathology, chemical pathology, pathological haematology, pathological immunology and clinical microbiology.

CODE 59 Respiratory and sleep medicine

'Respiratory and sleep medicine' includes thoracic medicine.

CODE 67 Other allied health (including complementary medicine)

'Other allied health (including complementary medicine)' includes: acupuncturist, allergy and asthma consultant, alternative health services, audiologist, audiometrist, Chinese medicine therapist, chiropodist, dental hygienist, dental technician, drug and alcohol counsellor, hygiene consultant, naturopath, occupational health and safety practitioner, occupational therapist, optometrist, social worker, speech pathologist, speech therapist and therapeutic masseur.

CODE 68 Other hospital-based medical practitioners

'Other hospital-based medical practitioners' includes junior doctors, resident doctors, house officers, interns, and other clinicians who do not have a specialty.

CODE 71 Anaesthesia

‘Anaesthesia’ includes general anaesthesia, paediatric anaesthesia and intensive care anaesthesia.

CODE 82 Pain medicine

‘Pain medicine’ includes specialists in managing severe pain problems in the areas of acute pain, cancer pain and chronic pain (Faculty of Pain Medicine 2003).

CODE 97 Not applicable

‘Not applicable’ should be used where no clinical or medical administration staff were involved in the incident.

CODE 99 Not stated/inadequately described

‘Not stated/inadequately described’ should be used when the information is not currently available. Not stated/inadequately described should not be used when a claim is closed.

Comments: The general aim of this list is to include all categories that might be of relevance to medical indemnity claims. The medical specialties included in this value domain are taken from the List of Australian Recognised Medical Specialties, a list approved by the Minister for Health and Ageing (AMC 2009) and from the lists of clinical specialties developed by various health authorities for use in their medical indemnity data collections.

The categories of medical specialists align well between the Australian Prudential Regulation Authority (2006) National Claims and Policies Database (NCPD) and the Medical Indemnity National Collection (MINC). The NCPD specifications have separate codes for several allied health and complementary fields which are subsumed within the MINC category ‘Other allied health (including complementary medicine)’. In the NCPD, ‘student practitioner or intern’ is a separate category. The MINC codes students based on the speciality they are training in, and classifies interns with ‘Other hospital-based medical practitioners’ (AIHW 2011).

Recording the specialty of the individual clinician at this data element does not imply that the individual was ‘at fault’. These individuals may or may not be defendants in the medical indemnity claim.

Data element attributes

Collection and usage attributes

Guide for use:

This data element should record the specialty of the clinician who played the most prominent role in the incident that gave rise to the medical indemnity claim; that is, the individual whose actions or omissions are directly implicated in 'what went wrong'. The individual may or may not be a defendant in the medical indemnity claim.

Only one code may be selected for this data element.

The principal clinician specialty should usually relate to the primary incident or allegation type.

For a particular clinician, the specialty recorded should be the main clinical area in which that clinician has formal qualifications (or, in the case of a specialist-in-training, is working towards gaining formal qualifications), and/or in which that clinician primarily practices. The specialty recorded may not be the area in which the clinician was working at the time of the incident. For example, if a clinician involved in the incident was a general surgeon, but was working in the Emergency department when the incident occurred, Code 25 'General surgery' should be recorded.

Where a private doctor was closely involved in the incident, the specialty of the private doctor should be recorded.

This data element should be completed on the basis of available information about the specialty of clinicians closely involved in the incident; specialty should not be assumed based on other information. For example, if the incident occurred in the course of repair to an aortic abdominal aneurysm, Code 66 'Vascular surgery' should only be recorded where there is information to confirm that a vascular surgeon was among the clinicians involved.

Where a registrar was closely involved in the incident, the specialty for which the registrar was training at the time of the incident should be recorded.

Where no clinical staff were involved in the incident (for example where the medical indemnity claim relates to actions of hospital administrative staff) Code 97 'Not applicable' should be recorded.

Principal diagnosis—episode of care

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—principal diagnosis, code (ICD-10-AM 7th edn) ANN{.N[N]}

METeOR identifier: 391326

Registration status: Health, Standard 22/12/2009
Tasmanian Health, Proposed 28/09/2011

Definition: The diagnosis established after study to be chiefly responsible for occasioning an episode of admitted patient care, an episode of residential care or an attendance at the health care establishment, as represented by a code.

Data Element Concept: Episode of care—principal diagnosis

Value domain attributes

Representational attributes

Classification scheme: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification 7th edition

Representation class: Code

Data type: String

Format: ANN{.N[N]}

Maximum character length: 6

Data element attributes

Collection and usage attributes

Guide for use: The principal diagnosis must be determined in accordance with the Australian Coding Standards. Each episode of admitted patient care must have a principal diagnosis and may have additional diagnoses. The diagnosis can include a disease, condition, injury, poisoning, sign, symptom, abnormal finding, complaint, or other factor influencing health status.

As a minimum requirement the Principal diagnosis code must be a valid code from the current edition of ICD-10-AM.

For episodes of admitted patient care, some diagnosis codes are too imprecise or inappropriate to be acceptable as a principal diagnosis and will group to an error DRG in the Australian Refined Diagnosis Related Groups.

Diagnosis codes starting with a V, W, X or Y, describing the circumstances that cause an injury, rather than the nature of the injury, cannot be used as principal diagnosis.
Diagnosis codes which are morphology codes cannot be used as principal diagnosis.

Collection methods: A principal diagnosis should be recorded and coded upon **separation**, for each episode of admitted patient care or episode of residential care or attendance at a health care establishment. The principal diagnosis is derived from and must be substantiated by clinical documentation.

Comments: The principal diagnosis is one of the most valuable health data elements. It is used for epidemiological research, casemix studies and planning purposes.

Principal drug of concern

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Episode of treatment for alcohol and other drugs—drug of concern (principal), (ASCDC 2011 extended) code NNNN
METeOR identifier:	467699
Registration status:	Health, Standard 07/12/2011
Definition:	The main drug, as stated by the client, that has led a person to seek treatment from the service, as represented by a code.
Context:	Required as an indicator of the client's treatment needs.
Data Element Concept:	Episode of treatment for alcohol and other drugs—drug of concern

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Classification of Drugs of Concern 2011
Representation class:	Code
Data type:	String
Format:	NNNN
Maximum character length:	4

Supplementary values:

Value	Meaning
0005	Opioid analgesics not further defined
0006	Psychostimulants not further defined

Collection and usage attributes

Guide for use:

The Australian Standard Classification of Drugs of Concern (ASCDC) provides a number of supplementary codes that have specific uses and these are detailed within the ASCDC, e.g. 0000 = inadequately described.

Other supplementary codes that are not already specified in the ASCDC may be used in National Minimum Data Sets (NMDS) when required. In the Alcohol and other drug treatment service NMDS, two additional supplementary codes have been created which enable a finer level of detail to be captured:

CODE 0005 Opioid analgesics not further defined

This code is to be used when it is known that the client's principal drug of concern is an opioid but the specific opioid used is not known. The existing code 1000 combines opioid analgesics and non-opioid analgesics together into Analgesics nfd and the finer level of detail, although known, is lost.

CODE 0006   Psychostimulants not further defined

This code is to be used when it is known that the client's principal drug of concern is a psychostimulant but not which type. The existing code 3000 combines stimulants and hallucinogens together into Stimulants and hallucinogens nfd and the finer level of detail, although known, is lost.

Psychostimulants refer to the types of drugs that would normally be coded to 3100-3199, 3300-3399 and 3400-3499 categories plus 3903 and 3905.

Data element attributes

Collection and usage attributes

Guide for use: The principal drug of concern should be the main drug of concern to the client and is the focus of the client's treatment episode. If the client has been referred into treatment and does not nominate a drug of concern, then the drug involved in the client's referral should be chosen.

Collection methods: To be collected on commencement of the treatment episode.

For clients whose treatment episode is related to the alcohol and other drug use of another person, this metadata item should not be collected.

	4	Researcher
	5	Other
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 CLINICIAN

A clinician is a person mainly involved in the area of clinical practice. That is the diagnosis, care and treatment, including recommended preventative action, to patients or clients. Clinical practice may involve direct client contact or may be practised indirectly through individual case material (as in radiology and laboratory medicine).

CODE 2 ADMINISTRATOR

An administrator in a health profession is a person whose main job is in an administrative capacity in the profession, such as directors of nursing, medical superintendents, medical advisers in government health authorities and health profession union administrators.

CODE 3 TEACHER/EDUCATOR

A teacher/educator in a health profession is a person whose main job is employment by tertiary institutions or health institutions to provide education and training in the profession.

CODE 4 RESEARCHER

A researcher in a health profession is a person whose main job is to conduct research in the field of the profession, especially in the area of clinical activity. Researchers are employed by tertiary institutions, medical research bodies, health institutions, health authorities, drug companies and other bodies.

CODE 5 OTHER

Other roles include Public health/health promotion, Occupational health, Environmental health, and all other roles not covered by codes 1-4 above.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use: This data element is applicable to health professionals who were employed in the registered profession in Australia.

The health professional may be employed or self-employed in the profession.

Registered health professionals on leave at the time of registration are asked to report their usual principal role.

Principal source of funding

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Non-admitted patient service event—principal source of funding, code NN
METeOR identifier:	400680
Registration status:	Health, Standard 01/12/2010
Definition:	The principal source of funds for a non-admitted patient service event, as represented by a code.
Data Element Concept:	Non-admitted patient service event—principal source of funding

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	NN
Maximum character length:	2

Permissible values:

Value	Meaning
01	Health service budget (not covered elsewhere)
02	Health service budget (due to eligibility for Reciprocal Health Care Agreement)
03	Health service budget (no charge raised due to hospital decision)
04	Department of Veterans' Affairs
05	Department of Defence
06	Correctional facility
07	Medicare Benefits Scheme
08	Other hospital or public authority (contracted care)
09	Private health insurance
10	Worker's compensation
11	Motor vehicle third party personal claim
12	Other compensation (e.g. public liability, common law, medical negligence)
13	Self-funded
14	Other funding source

Supplementary values: 99 Not known

Collection and usage attributes

Guide for use:

CODE 01 Health service budget (not covered elsewhere)

Health service budget (not covered elsewhere) should be recorded as the funding source for Medicare eligible patients presenting at a public hospital outpatient department for whom there is no other funding arrangement.

CODE 02 Health service budget (due to eligibility for Reciprocal Health Care Agreement)

Patients who are overseas visitors from countries covered by Reciprocal Health Care Agreements.

CODE 03 Health service budget (no charge raised due to hospital decision)

Patients who are Medicare ineligible and receive public hospital services free of charge at the discretion of the hospital or the state/territory. Also includes patients for whom a charge is raised but is subsequently waived.

CODE 07 Medicare Benefits Scheme

Medicare eligible non-admitted patients presenting at a public hospital outpatient department for whom services are billed to Medicare. Includes both bulk-billed and patients with out-of-pocket expenses.

CODE 08 Other hospital or public authority (contracted care)

Patients receiving treatment under contracted care arrangements (inter-hospital contracted patient).

CODE 09 Private health insurance

Patients who are funded by private health insurance, including travel insurance for Medicare eligible patients.

Excludes: Overseas visitors for whom travel insurance is the major funding source.

CODE 13 Self-funded

This code includes funded by the patient, by the patient's family or friends, or by other benefactors.

CODE 14 Other funding source

This code includes overseas visitors for whom travel insurance is the major funding source.

Data element attributes

Collection and usage attributes

Guide for use: The principal source of funding should be assigned based on a best estimate of where the majority of funds come from. This data element is not designed to capture information on out-of-pocket expenses to patients (e.g. fees only partly covered by the Medicare Benefits Schedule).

Permissible values:	0	Not applicable (persons under 5 years of age or who speak only English)
	1	Very well
	2	Well
	3	Not well
	4	Not at all
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 0 Not applicable (persons under 5 years of age or who speak only English)

Not applicable, is to be used for people under 5 year of age and people who speak only English.

CODE 9 Not stated/inadequately described

Not stated/inadequately described, is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Comments:

The ABS advises that the most useful information provided by this metadata item is in the distinction between the two category groups of Very well/Well and Not well/Not at all.

Source and reference attributes

Reference documents: Standards for Statistics on Cultural and Language Diversity 1999. Cat. no. 1289.0. Canberra: ABS.

Data element attributes

Collection and usage attributes

Collection methods: This metadata item is only intended to be collected if a person has a main language other than English spoken at home; and/or first language spoken is not English.

Recommended question:

How well do you speak English? (tick one)

1. Very well
2. Well
3. Not well
4. Not at all

Generally this would be a self-reported question, but in some circumstances (particularly where a person does not speak English well) assistance will be required in answering this question. It is important that the person's self-assessed proficiency in spoken English be recorded wherever possible. This metadata item does not purport to be a technical assessment of proficiency but is a self-assessment in the four broad categories outlined above.

This metadata item is not relevant to and should not be collected for persons under the age of five years.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, this standard should be used wherever practically possible.

Comments: This metadata item identifies those people who may suffer disadvantage in terms of their ability to access services due to lack of ability in the spoken English language. This information can be used to target the provision of services to people whose lack of ability in spoken English is potentially a barrier to gaining access to government programs and services.

In conjunction with Indigenous status, the main language other than English spoken at home and the country of birth, this metadata item forms the minimum core set of cultural and language indicators recommended by the

Australian Bureau of Statistics.

Supplementary values:	0	Test not done (test not ordered or not performed)
	8	Test done but results unknown
	9	Unknown

Data element attributes

Collection and usage attributes

Collection methods:

The Australian Cancer Network Working Party established to develop guidelines for the pathology reporting of breast cancer recommends that hormone receptor assays be performed on all cases of invasive breast carcinoma. The report should include:

- the percentage of nuclei staining positive and the predominant staining intensity (low, medium, high), and
- a conclusion as to whether the assay is positive or

negative.

Proteinuria status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—proteinuria status, code N{.N}
METeOR identifier:	270346
Registration status:	Health, Standard 01/03/2005
Definition:	Whether there is a presence of excessive protein in the urine of the person, as represented by a code.
Data Element Concept:	Person—proteinuria status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N{.N}
Maximum character length:	2

Permissible values:	Value	Meaning
	1	Negative for protein
	1.1	Microalbuminuria present
	1.2	Microalbuminuria not present
	1.3	Microalbuminuria not tested
	2	Proteinuria
	3	Not tested
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Negative for protein

Negative for proteinuria - less than 1 plus on dipstick-testing or excretion of 300 mg or less of protein from 24-hour urine collection.

CODE 1.1 Microalbuminuria present

Microalbuminuria present

CODE 1.2 Microalbuminuria not present

Microalbuminuria not present

CODE 1.3 Microalbuminuria not tested

Microalbuminuria not tested

CODE 2 Proteinuria

Proteinuria - one or more pluses of protein in dipstick urinalysis or for a 24-hour urine collection, where the patient excretes more than 300 mg/per day of protein.

CODE 3 Not tested

Not tested - no urinalysis for proteinuria was taken.

Collection methods: Where laboratory testing is used to determine Proteinuria status the categorisation must be substantiated by clinical documentation such as an official laboratory report.

Data element attributes

Collection and usage attributes

Collection methods: Dipstick testing can be used to test for protein in a urine specimen. Proteinuria (i.e. excessive protein in the urine) on dipstick urinalysis is described as one or more pluses of protein and for a 24-hour urine collection where the patient excretes more than 300 mg/day of protein.

Microalbuminuria can be determining using any one of the following tests: spot urine, timed urine (24-hour collection) or albumin/creatinine ratio. Although the presence of microalbuminuria does not warrant categorisation as proteinuria, it is clinically significant in the diagnosis and treatment of diabetes.

Comments: In settings where the monitoring of a person's health is ongoing and where a measure can change over time (such as general practice), the Patient—diagnosis date, DDMMYYYY should be recorded.

Guide for use: The following is a list of the more common health care occupations, however, it is not intended to represent all the possible health care occupations:

Aboriginal and Torres Strait Islander Health Worker (ANZSCO code 411511)

Acupuncturist (ANZSCO code 252211)

Aged or disabled carer (ANZSCO code 423111)

Ambulance officer (ANZSCO code 411111)

Anaesthetist (ANZSCO code 253211)

Audiologist (ANZSCO code 252711)

Chiropractor (ANZSCO code 252111)

Clinical psychologist (ANZSCO code 272311)

Complementary Health Therapists n.e.c. (ANZSCO code

252299)
Dental assistant (ANZSCO code 423211)
Dental hygienist (ANZSCO code 411211)
Dental specialist (ANZSCO code 252311)
Dental technician (ANZSCO code 411213)
Dental therapist (ANZSCO code 411214)
Dentist (ANZSCO code 252312)
Dermatologist(ANZSCO code 253911)
Dietician (ANZSCO code 251111)
Drug and Alcohol Counsellor (ANZSCO code 272112)
Enrolled nurse (ANZSCO code 411411)
General medical practitioner (ANZSCO code 253111)
Health professionals (ANZSCO code 25)
Hospital pharmacist (ANZSCO code 251511)
Intensive care ambulance paramedic (AUS) / ambulance paramedic (NZ) (ANZSCO code 411112)
Massage therapist (ANZSCO code 411611)
Medical diagnostic radiographer (ANZSCO code 251211)
Medical practitioners n.e.c. (ANZSCO code 253999)
Medical radiation therapist (ANZSCO code 251212)
Midwife (ANZSCO code 254111)
Naturopath (ANZSCO code 252213)
Nuclear medicine technologist (ANZSCO code 251213)
Nurse educator (ANZSCO code 254211)
Nurse manager (ANZSCO code 254311)
Nurse practitioner (ANZSCO code 254411)
Nurse researcher (ANZSCO code 254212)
Nursing assistant support worker (ANZSCO code 423312)
Occupational therapist (ANZSCO code 252411)
Ophthalmologist (ANZSCO code 253914)
Optometrist (ANZSCO code 251411)
Orthoptist (ANZSCO code 251412)
Orthotist or Prosthetist (ANZSCO code 251912)
Osteopath (ANZSCO code 252112)
Paediatrician (ANZSCO code 253321)
Pathologist (ANZSCO code 253915)
Physiotherapist (ANZSCO code 252511)
Podiatrist (ANZSCO code 252611)
Psychiatrist (ANZSCO code 253411)
Psychologists n.e.c. (ANZSCO code 272399)
Radiologist (ANZSCO code 253916)
Registered nurse (developmental disability)(ANZSCO code 254416)

Registered nurse (mental health)(ANZSCO code 254422)

Registered Nurses n.e.c. (ANZSCO code 254499)

Rehabilitation counsellor (ANZSCO code 272114)

Retail pharmacist (ANZSCO code 251513)

Social worker (ANZSCO code 272511)

Sonographer (ANZSCO code 251214)

Specialist physician (general medicine) (ANZSCO code 253311)

Speech pathologist (AUS) / speech language therapist (NZ) (ANZSCO code 252712)

Surgeon (general) (ANZSCO code 253511)

Therapy aide (ANZSCO code 423314)

Collection methods: Data is collected at the time a health care provider identification record is created.

Multiple instances of health care occupation may be collected where the individual provides a significant amount of services in more than one category. For example, a dentist who is also a medical practitioner may practice as both.

Record as many as apply.

Accurate data are best achieved using computer assisted coding. A computer assisted coding system is available from the ABS to assist in coding occupational data to ANZSCO codes.

Data coded at the 4-digit and 6-digit level will provide more detailed information than that collected at the higher levels and may be more useful. However, the level at which data are coded and reported will depend on the purpose of collecting this information.

Comments: ANZSCO defines ‘occupation’ as ‘a set of jobs with similar sets of tasks’. Operationally this is defined as ‘a collection of jobs which are sufficiently similar in their main tasks to be grouped together for purposes of the classification’. Job is defined as ‘a set of tasks designed to be performed by one individual for a wage or salary’.

Purchase of goods and services

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Organisation—purchase of goods and services, total Australian currency NNNNN.N

METeOR identifier: 359935

Registration status: Health, Standard 05/12/2007

Definition: Expenses of an organisation consisting mainly of purchases of goods and services, in Australian currency.

Data Element Concept: Organisation—purchase of goods and services

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: NNNNN.N

Maximum character length: 6

Unit of measure: Australian currency (AU$)

Source and reference attributes

Submitting organisation: Health Expenditure Advisory Committee

Data element attributes

Collection and usage attributes

Guide for use: Expenses relating to purchases of goods and services are to be reported in millions to the nearest 100,000 e.g. $4,064,000 should be reported as $4.1 million.

When revenue from transactions are offset against expenses from transactions, the result equates to the net operating balance in accordance with Australian Accounting Standards Board 1049 (September 2006).

Includes:

- administrative expenses (excluding workers compensation premiums and payouts)
- domestic services
- drug supplies
- food supplies
- grants
- medical and surgical supplies

- patient transport
- payments to visiting medical officers
- repairs and maintenance
- social benefits
- subsidy expenses
- other expenses (includes contracted care services purchased from private hospitals)

Collection methods: Data are collected and nationally collated for the reporting period - the financial year ending 30th June each year.

In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Expenses relating to purchases of goods and services are to be reported for the *Health industry relevant organisation type* and *Type of health and health related functions* data elements.

Health industry relevant organisation type

State and territory health authorities are **NOT** to report the following codes:

Codes 106–109; 111; 115–119; 123; 201 and 203

Type of health and health related functions

State and territory health authorities are **NOT** to report the following codes:

Codes 199; 299; 303–305; 307; 499; 503–504; 599; 601–603; 688; 699

Comments: In accounting terms, expenses are consumptions or losses of future economic benefits in the form of reductions in assets or increases in liabilities of the entity (other than those relating to distributions to owners) that result in a decrease in equity or net worth during the reporting period.

Radiation dose administered

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer treatment—radiation dose administered, total Gray N[NN.NN]

METeOR identifier: 408039

Registration status: Health, Standard 07/12/2011

Definition: The largest prescribed dose of radiation administered during the initial course of treatment for cancer, measured in Gray (Gy).

Data Element Concept: Cancer treatment—radiation dose administered

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NN.NN]

Maximum character length: 5

Supplementary values:

Value	Meaning
999.97	Not applicable-radiotherapy was not administered
999.98	Unknown whether radiotherapy was administered
999.99	Radiotherapy was administered but the dose is not stated/inadequately described

Unit of measure: Gray (Gy)

Collection and usage attributes

Guide for use: One gray is equivalent to 100 centigray (cGy). For example, a radiation dose of 5040 cGy equates to 50.40 Gy. This would be recorded as 50.40.

Data element attributes

Collection and usage attributes

Guide for use: The gray (Gy) is the SI (International System of Units) unit of absorbed radiation dose of ionizing radiation (for example, X-rays), and is defined as the absorption of one joule of ionizing radiation by one kilogram of matter (usually human tissue).

The radiation dose administered records the largest prescribed dose to the target. This means that for patients that have a boost treatment, the largest prescribed dose is the addition of the boost to the other phases of treatment.

Record the largest prescribed dose to the target site for all courses of **radiotherapy** delivered to the patient during the initial course of treatment. The initial course of treatment is treatment administered to the patient from diagnosis and before disease progression or recurrence.

The patient may receive more than one course of radiotherapy during the initial course of treatment. For example, radiotherapy may be administered to the primary site and the site of a distant metastasis. Record the radiation dose received for each course of treatment.

The radiation dose administered is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of treatment.

The International Commission on Radiation Units and Measurements (ICRU) develops internationally acceptable recommendations regarding quantities and units of radiation and radioactivity, procedures suitable for the measurement and application of these quantities in clinical radiology and radiobiology, and physical data needed in the application of these procedures to support uniformity in reporting.

The ICRU recommends recording doses at the axis point where applicable (opposed fields, four field box, wedged pairs and so on). The ICRU50 reference dose should be recorded for photon therapy if available, otherwise a description of the received dose at the centre of the planning target volume. The ICRU58 should be recorded for brachytherapy. For maximum consistency in this field, the ICRU recommendations should be followed whenever possible.

Do not include treatment with unsealed radioisotopes.

Collection methods: The radiation dose will typically be found in the radiation oncologist's summary letter for the initial course of treatment or in the radiotherapy treatment summary in the patient's medical record.

Determining the total dose may require assistance from the radiation oncologist for consistent coding.

Comments: The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome. Patient outcomes are strongly related to the radiotherapy dose delivered.

Data Element Concept:	Cancer treatment—radiotherapy completion date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

The completion date for radiotherapy is the date the last dose was administered. Record the completion date of radiotherapy for all courses administered during the initial course of treatment for cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The patient may receive more than one course of radiotherapy during the initial course of treatment. For example, radiotherapy may be administered to the primary site and the site of a distant metastasis. Record the completion date for each course of treatment.

The completion date of radiotherapy is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of treatment.

Record the completion date for radiotherapy administered as external beam radiotherapy or brachytherapy. Do not include radiotherapy with unsealed radioisotopes.

Dates of surgery, systemic agent therapies and systemic therapy procedures are collected as separate items.

Collection methods: The radiotherapy completion date will typically be found in the radiation oncologist's summary letter for the initial course of treatment or in the radiotherapy treatment summary in the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Value	Meaning
97	Not applicable-no radiotherapy was administered
98	Unknown whether radiotherapy was administered
99	Radiotherapy administered but the number of fractions not stated/inadequately described

Collection and usage attributes

Guide for use: Valid values are 1 to 96.

Data element attributes

Collection and usage attributes

Guide for use: A total dose of radiation is delivered to the patient in a number of even parts or treatment sessions (fractions). Although a treatment session may include several treatment portals delivered within a confined period of time, usually a few minutes, it is still considered one fraction.

Record the number of fractions of radiotherapy treatment for all courses delivered to the patient during the initial course of treatment for cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The patient may receive more than one course of radiotherapy during the initial course of treatment. For example, radiotherapy may be administered to the primary site and the site of a distant metastasis. Record the total radiation dose for each course of treatment.

The number of fractions administered is recorded regardless of whether the course of treatment is completed as intended and regardless of the intent or timing of treatment.

The number of radiotherapy fractions recorded should include any boost.

Brachytherapy (or implants) may be delivered more than once, each treatment is recorded as a fraction.

Do not include treatment with unsealed radioisotopes.

Collection methods: The number of radiotherapy fractions delivered will typically be found in the radiation oncologist's summary letter for the initial course of treatment or in the radiotherapy treatment summary in the patient's medical record.

Determining the number of fractions may require assistance from the radiation oncologist for consistent coding.

Comments: The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome.

Guide for use:

Record the first or earliest date radiotherapy commenced for all courses of radiotherapy administered during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The patient may receive more than one course of radiotherapy during the initial course of treatment. For example, in the treatment of cancer, radiotherapy may be administered to the primary site and the site of a distant metastasis. Record the start date for each course of treatment.

The start date of radiotherapy is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of treatment.

Record the start date for radiotherapy administered as external beam radiotherapy or brachytherapy. Do not include radiotherapy with unsealed radioisotopes.

This item should be used when collecting information about cancer patient care for safety and quality monitoring and other public health purposes. If collecting radiotherapy start date to examine service volumes for the purpose of calculating radiotherapy waiting times use *Patient—radiotherapy start date, DDMMYYYY*.

Collection methods: The radiotherapy commencement date(s) will typically be found in the radiation oncologist's summary letter for the initial course of treatment or in the radiotherapy treatment summary in the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

	99	Radiotherapy was administered but the site not stated/inadequately described

Collection and usage attributes

Guide for use:	More than one site may be targeted for radiotherapy during the initial course of treatment; select the appropriate code value.

Source and reference attributes

Submitting organisation: Cancer Australia

Data element attributes

Collection and usage attributes

Guide for use:

The target site is collected for all courses of radiotherapy administered to the patient during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The target site for radiotherapy is recorded regardless of whether the course of treatment is completed as intended, the intent or timing of the radiotherapy, and the radiation therapy treatment modality.

Record the value representing all the sites targeted for radiotherapy during the initial course of treatment. There may be more than one site targeted for treatment. For example, the primary tumour site and the site of a distant metastasis may receive radiotherapy as part of the initial course of treatment. In this case code "5" would be recorded.

The target site for surgery is collected as a separate data item.

Collection methods:

This information should be obtained from the patient’s radiotherapy records.

Determining the target site of radiotherapy may require assistance from the radiation oncologist for consistent coding.

Comments:

This is collected to identify which sites are targeted by radiotherapy and is useful in evaluating patterns of care and patient outcomes.

Collection and usage attributes

Guide for use: More than one radiotherapy treatment type may be delivered during the initial course of treatment; select the appropriate code value.

The difference between the types of radiotherapy relates to the position of the radiation source:

- External beam radiotherapy (EBRT) is delivered by directing the radiation at the tumour from outside the body.
- Brachytherapy or sealed source radiotherapy is delivered by placing the radiation source in close proximity to the tumour site.
- Unsealed radioisotopes or systemic radioisotope therapy is delivered by infusion into the bloodstream or by ingestion and is a form of targeted therapy.

Source and reference attributes

Submitting organisation: Cancer Australia

Reference documents: DeVita VT, Hellman S, Rosenberg SA 2005. Cancer: Principles and practice of oncology, 7th edition. Philadelphia: Lippincott Williams & Wilkins

Data element attributes

Collection and usage attributes

Guide for use: External beam radiotherapy (EBRT) is delivered by directing the radiation at the tumour from outside the body. Types of external beam radiotherapy include conventional EBRT, intensity modulated radiation therapy (IMRT) and 3-dimensional conformal radiotherapy (3D-CRT).

Brachytherapy is delivered by placing the radiation source in close proximity to the tumour site. The radioactive isotopes are sealed in tiny pellets or “seeds” which are placed in the body using delivery devices such as needles or catheters. Types include interstitial brachytherapy, which uses a source placed within tumour tissue, for example, within a prostate tumour; and intracavitary brachytherapy, whereby the source is placed within a surgical cavity or a body cavity. Brachytherapy can involve the temporary or permanent placement of radioactive sources.

Unsealed radioisotopes or systemic radioisotope therapy is delivered by infusion into the bloodstream or by ingestion and is a form of targeted therapy. Targeting can be due to the chemical properties of the isotope, for example, radioiodine is specifically absorbed by the thyroid gland. It can also be achieved by attaching the radioisotope to another molecule or antibody to guide it to the target tissue. Examples of treatment with unsealed radioisotopes include the infusion of metaiodobenzylguanidine (MIBG) to treat neuroblastoma and of oral iodine-131 to treat thyroid cancer.

Radiotherapy treatment type is collected for all courses of radiotherapy delivered to the patient during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The radiotherapy treatment type is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of treatment.

More than one radiotherapy treatment type may be administered during the initial course of treatment; select the appropriate code value.

If external beam radiotherapy and/or brachytherapy were administered, the radiation dose received and number of fractions should also be collected as well as the start and finish dates of the radiotherapy.

Most external beam radiotherapy is delivered on an outpatient basis.

Brachytherapy is likely to be delivered to admitted patients.

Collection methods: The radiotherapy treatment modality will typically be found in the radiation oncologist's summary letter for the initial course of treatment or in the radiotherapy treatment summary in the patient's medical record.

Determining the treatment modality may require assistance from the radiation oncologist for consistent coding.

Comments: To evaluate patterns of radiotherapy care and analyse patient outcomes, it is necessary to know which treatment modalities were employed in the delivery of treatment.

Maximum character length:	2

Permissible values:

Value	Meaning
1	Treatment completed
2	Change in main treatment type
3	Change in the delivery setting
4	Change in the principal drug of concern
5	Transferred to another service provider
6	Ceased to participate against advice
7	Ceased to participate without notice
8	Ceased to participate involuntary (non-compliance)
9	Ceased to participate at expiation
10	Ceased to participate by mutual agreement
11	Drug court and /or sanctioned by court diversion service
12	Imprisoned, other than drug court sanctioned
13	Died
98	Other

Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

To be collected on cessation of a treatment episode. Codes 1 to 12 listed above are set out as follows to enable a clearer picture of which codes are to be used for what purpose:

Treatment completed as planned:

CODE 1 Treatment completed

Client ceased to participate:

CODE 6 Ceased to participate against advice

CODE 7 Ceased to participate without notice

CODE 8 Ceased to participate involuntary (non-compliance)

CODE 9 Ceased to participate at expiation

Ceased to participate at expiation:

CODE 11 Drug court and /or sanctioned by court diversion service

CODE 12 Imprisoned, other than drug court sanctioned

Treatment not completed (other):

CODE 2 Change in main treatment type

CODE 3 Change in the delivery setting

CODE 4 Change in the principal drug of concern

CODE 5 Transferred to another service provider

Treatment ceased by mutual agreement:

CODE 10 Ceased to participate by mutual agreement

CODE 1 Treatment completed

This code is to be used when all of the immediate goals of the treatment have been completed as planned. Includes situations where the client, after completing this treatment, either does not commence any new treatment, commences a new treatment episode with a different main treatment or principal drug, or is referred to a different service provider for further treatment.

CODE 2 Change in main treatment type

A treatment episode will end if, prior to the completion of the existing treatment, there is a change in the main treatment type for alcohol and other drugs. See also Code 10.

CODE 3 Change in the delivery setting

A treatment episode may end if, prior to the completion of the existing treatment, there is a change in the treatment delivery setting for alcohol and other drugs. See also Code 10 and the Guide for use section in metadata item Episode of treatment for alcohol and other drugs.

CODE 4 Change in the principal drug of concern

A treatment episode will end if, prior to the completion of the existing treatment, there is a change in the principal drug of concern. See also Code 10.

CODE 5 Transferred to another service provider

This code includes situations where the service provider is no longer the most appropriate and the client is transferred/referred to another service. For example, transfers could occur for clients between non-residential and residential services or between residential services and a hospital. Excludes situations where the original treatment was completed before the client transferred to a different provider for other treatment (use Code 1).

CODE 6 Ceased to participate against advice

This code refers to situations where the service provider is aware of the client's intention to stop participating in treatment, and the client ceases despite advice from staff that such action is against the client's best interest.

CODE 7 Ceased to participate without notice

This code refers to situations where the client ceased to receive treatment without notifying the service provider of their intention to no longer participate.

CODE 8 Ceased to participate involuntary (non-compliance)

This code refers to situations where the client's participation has been ceased by the service provider due to non-compliance with the rules or conditions of the program.

CODE 9 Ceased to participate at expiation

This code refers to situations where the client has fulfilled their obligation to satisfy expiation requirements (e.g. participate in a treatment program to avoid having a criminal conviction being recorded against them) as part of a police or court diversion scheme and chooses not to continue with further treatment.

CODE 10 Ceased to participate by mutual agreement

This code refers to situations where the client ceases participation by mutual agreement with the service provider even though the treatment plan has not been completed. This may include situations where the client has moved out of the area. Only to be used when Code 2, 3 or 4 is not applicable.

CODE 11 Drug court and/or sanctioned by court diversion service

This code applies to drug court and/or court diversion service clients who are sanctioned back into jail for non-compliance with the program.

CODE 12 Imprisoned, other than drug court sanctioned

This code applies to clients who are imprisoned for reasons other than Code 11.

Data element attributes

Collection and usage attributes

Comments: Given the levels of attrition within alcohol and other drug treatment programs, it is important to identify the range of different reasons for ceasing treatment with a service.

17	Asthma

	18	Sensory conditions (ear and eye conditions)
	19	Neurological condition
	20	Malignancy (cancer, excluding non-melanoma skin cancer)
	21	Arthritis
	22	Women's health
	25	Other
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

More than one code may be recorded if there are multiple reasons for visiting the health clinic.

CODE 1 Health check

Record this code if the person attended the clinic for a general health check.

CODE 2 Diabetes

Record this code if the person attended the clinic for treatment of Type 1, Type 2 or gestational diabetes.

CODE 3 Mental health condition

Record this code if the person attended the clinic for treatment of a mental health condition.

CODE 4 Pathology

Record this code if the person attending the clinic was having blood or urine tested or receiving results from a blood or urine test.

CODE 5 Skin condition (excludes cancer and communicable diseases)

Record this code if the person attended the clinic for a skin condition (excludes cancer and communicable diseases).

CODE 6 Drug and alcohol issue

Record this code if the person attended the clinic for a drug and alcohol issue.

CODE 7 Medication

Record this code if the person attended the clinic for medication.

CODE 8 Vaccination

Record this code if the person attended the clinic for a vaccination.

CODE 9 Musculoskeletal injury

Record this code if the person attended the clinic for a musculoskeletal injury. Musculoskeletal conditions are recorded separately.

CODE 10 Musculoskeletal condition (excluding arthritis, injury or cancer)

Record this code if the person attended the clinic for a musculoskeletal condition. This excludes arthritis, cancer or injury.

CODE 11 Cardiovascular disease

Record this code if person attended the clinic for treatment of cardiovascular disease (includes coronary heart disease, heart failure, rheumatic fever, rheumatic heart disease, congenital heart disease, stroke and peripheral vascular disease).

CODE 12 Respiratory condition (excludes asthma, cancer or communicable diseases)

Record this code if the person attended the clinic for treatment of a respiratory condition.

CODE 13 Communicable disease

Communicable diseases are those which are capable of being transmitted between individuals and include infectious and parasitic disease (Healey 2004). Record this code if person attended the clinic for treatment of a communicable disease (includes blood-borne diseases, gastrointestinal diseases, quarantinable diseases, sexually transmitted infections, vaccine preventable diseases, vector-borne diseases, zoonoses and other bacterial infections.

CODE 14 Dental

Record this code if the person attended the clinic for dental referral, dental procedures or dental pain.

CODE 15 Digestive condition (excluding cancer)

Record this code if the person attended the clinic for treatment of a digestive condition. This excludes cancers which are recorded separately.

CODE 16 Wound care

Record this code if the person attended the clinic for wound care for example dressings or review.

CODE 17 Asthma

Record this code if the person attended the clinic for the treatment of asthma.

CODE 18 Sensory conditions (ear and eye conditions)

Record this code if the person attended the clinic for the treatment of ear or eye conditions.

CODE 19 Neurological condition

Record this code if the person attended the clinic for neurological conditions for example epilepsy, Parkinson disease, motor neurone disease.

CODE 20 Malignancy (cancer, excludes non-melanoma skin cancer)

Record this code if the reason for attending the clinic was a malignancy (cancer), excludes non-melanoma skin cancer.

CODE 21 Arthritis

Record this code if the person attended the clinic for treatment of arthritis (includes gout, rheumatism, osteoarthritis, rheumatoid arthritis, other type, arthritis type unknown).

CODE 22 Women's health

Record this code if the person attended the clinic for women's health issues for example cervical screening, contraceptives.

CODE 25 Other

Record this code if the person attended the clinic for a reason not specified above.

CODE 99 Not stated/inadequately described

Record this code when the reason is unknown.

Comments: The list of reasons for attendance at the health clinic was initially guided by the most common categories reported in a number of relevant surveys, for example the 2001 NSW Inmate Health Survey, Queensland Women Prisoners' Health Survey and the *General Practice Activity in Australia 2007-08* (Britt et al. 2008). Following the 2009 National Prisoner Health Census, the list was amended to include the reasons recorded in the 'Other' category on the National Prisoner Health Census Clinic form.

	02	Discrimination
	03	Cultural inappropriateness
	04	Indifference or unwillingness
	05	Difficulty in attending health service
	06	Waiting time too long or service not available at time required
	07	Required service not available in a specific location
	08	Too busy
	09	Legal reasons
	10	Intoxication
	20	Other reasons
Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

More than one reason may be selected.

CODE 1 Cost

Includes all cases where a health service was not sought because it was likely to be unaffordable.

CODE 2 Discrimination

Includes all cases of perceived discrimination at a health service, on the basis of factors such as age, sex, disability, religion or culture, etc.

CODE 3 Cultural inappropriateness

Includes cases where a health service was not sought because of a perceived lack of cultural consideration e.g. lack of appropriate interpreter services, or no service provider of similar cultural background available.

CODE 4 Indifference or unwillingness

Includes cases where a health service was not sought because a person either felt that seeking a health service was unnecessary, a person did not want to seek a health service, or a person lacked motivation to seek a health service.

CODE 5 Difficulty in attending health service

Includes cases where a health service was not sought either due to lack of available transport to attend the service or the distance required to attend a health service was perceived as being too great.

CODE 6 Waiting time too long or service not available at time required

Includes cases where the waiting time for a health service (either expected or actual) was too long, or the health service was not available at the required time.

CODE 7 Required service not available in a specific location

Includes cases where a health service was not available in the person's location e.g. local community area, prison etc.

CODE 8 Too busy

Includes cases where the person was too busy to seek a health service e.g. work, personal or family responsibilities.

CODE 9 Legal reasons

Includes cases where the person did not seek a health service for legal reasons e.g. likely arrest, actual arrest, appearance in court or being in custody.

CODE 10 Intoxication

Includes cases where the person did not seek a health service because they were intoxicated as a result of drug use, alcohol consumption or other causes.

CODE 20 Other reasons

Includes all reasons not elsewhere included.

Guide for use:

CODE 1 ST-segment-elevation myocardial infarction

This code is used when the reason for admission is persistent ST elevation of >=1mm in two contiguous limb leads, or ST elevation of >=2mm in two contiguous chest leads, or with new left bundle-branch block (BBB) pattern on the ECG.

CODE 2 Non-ST-segment-elevation ACS with high-risk features

This code is used when the reason for admission is clinical features consistent with an acute coronary syndrome with high-risk features which include any of the following:

- repetitive or prolonged (> 10 minutes) ongoing chest pain or discomfort;
- elevated level of at least one cardiac biomarker (troponin or creatine kinase-MB isoenzyme);
- persistent or dynamic ECG changes of ST segment depression >= 0.5mm or new T wave >= 2mm;
- transient ST-segment elevation (>= 0.5 mm) in more than 2 contiguous leads;
- haemodynamic compromise: Blood pressure < 90 mmHg systolic, cool peripheries, diaphoresis, Killip Class > 1, and/or new onset mitral regurgitation;
- sustained ventricular tachycardia;
- syncope;
- left ventricular systolic dysfunction (left ventricular ejection fraction < 0.40);
- prior percutaneous coronary intervention within 6 months or prior coronary artery bypass surgery;
- presence of known diabetes (with typical symptoms of ACS); or
- chronic kidney disease (estimated glomerular filtration rate < 60mL/minute) (with typical symptoms of ACS).

CODE 3 Non-ST-segment-elevation ACS with intermediate-risk features

This code is used when the reason for admission is clinical features consistent with an acute coronary syndrome and any of the following intermediate-risk features AND NOT meeting the criteria for high-risk ACS:

- chest pain or discomfort within the past 48 hours that occurred at rest, or was repetitive or prolonged (but currently resolved);
- age greater than 65yrs;
- known coronary heart disease: prior myocardial infarction with left ventricular ejection fraction >= 0.40, or known coronary lesion more than >50% stenosed;
- no high-risk changes on electrocardiography (see high-risk features);
- two or more of the following risk factors: of known hypertension, family history, active smoking or

hyperlipidaemia;

- presence of known diabetes (with atypical symptoms of ACS);
- chronic kidney disease (estimated glomerular filtration rate < 60mL/minute) (with atypical symptoms of ACS); or
- prior aspirin use.

CODE 4 Non-ST-segment-elevation ACS with low-risk features

This code is used when the reason for admission is clinical features consistent with an acute coronary syndrome without intermediate or high-risk features of non-ST-segment-elevation ACS. This includes onset of anginal symptoms within the last month, or worsening in severity or frequency of angina, or lowering of anginal threshold.

CODE 5 Percutaneous coronary intervention (PCI)

This code is used when the reason for admission is for a PCI, where the PCI is not immediately precipitated by a recurrent ischaemic event. If a recurrent ischaemic event precipitates a readmission with an associated PCI undertaken, one of codes 1-4 should be coded.

CODE 6 Coronary artery bypass graft (CABG)

This code is used when the reason for admission is for a CABG, where the CABG is not immediately precipitated by a recurrent ischaemic event. If a recurrent ischaemic event precipitates a readmission with an associated CABG undertaken, one of codes 1-4 should be coded.

CODE 7 Heart failure (without MI)

This code is used when the reason for admission is for the treatment of heart failure, where heart failure is not immediately precipitated by a recurrent ischaemic event. If a recurrent ischaemic event precipitates a readmission, one of codes 1-4 should be coded.

CODE 8 Arrhythmia (without MI)

This code is used when the reason for admission is for the treatment of an arrhythmia, where the arrhythmia is not immediately precipitated by a recurrent ischaemic event. If a recurrent ischaemic event precipitates a readmission, one of codes 1-4 should be coded.

Data element attributes

Collection and usage attributes

Guide for use: To determine if this item should be collected ask the person being admitted if they have been discharged from an episode of admitted patient care for acute coronary syndrome within the last 28 days.

Comments: This metadata item is designed to identify recurrent admissions following an initial presentation with acute coronary syndromes (ACS), not necessarily to the hospital responsible for the index admission.

Reason for removal from elective surgery waiting list

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—reason for removal from a waiting list, code N
METeOR identifier:	471735
Registration status:	Health, Standard 13/12/2011
Definition:	The reason why a patient is removed from the elective surgery waiting list, as represented by a code.
Data Element Concept:	Elective surgery waiting list episode—reason for removal from a waiting list

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Admitted as an elective patient for awaited procedure by or on behalf of this hospital or the state/territory
	2	Admitted as an emergency patient for awaited procedure by or on behalf of this hospital or the state/territory
	3	Could not be contacted (includes patients who have died while waiting, whether or not the cause of death was related to the condition requiring treatment)
	4	Treated elsewhere for awaited procedure, but not on behalf of this hospital or the state/territory
	5	Surgery not required or declined
	6	Transferred to another hospital's waiting list
Supplementary values:	9	Not known

Collection and usage attributes

Guide for use:

CODE 1 Admitted as an elective patient for awaited procedure by or on behalf of this hospital or the state/territory

Patients undergoing the awaited procedure whilst admitted for another reason are to be coded this code.

CODE 2 Admitted as an emergency patient for awaited procedure by or on behalf of this hospital or the state/territory

This code identifies patients who were admitted ahead of their normal position in the queue because the condition requiring treatment deteriorated whilst waiting. Admission as an emergency patient could also be due to other causes such as inappropriate urgency rating, delays in the system, or unpredicted biological variation.

CODES 3 - 5

CODE 3 Could not be contacted (includes patients who have died while waiting, whether or not the cause of death was related to the condition requiring treatment)

CODE 4 Treated elsewhere for awaited procedure, but not on behalf of this hospital or the state/territory

This code would be used where surgery was undertaken other than by or on behalf of this hospital or the state/territory; for example, the patient has accessed surgery as a private patient in a private hospital.

CODE 5 Surgery not required or declined

These codes provide an indication of the amount of clerical audit of the waiting lists. Code 4 gives an indication of patients treated other than as a patient of the hospital's waiting list. The awaited procedure may have been performed as an emergency or as an elective procedure.

CODE 6 Transferred to another hospital's waiting list

This code identifies patients who were transferred from one hospital's elective surgery waiting list to that of another hospital. The waiting time on the waiting lists at the initial hospital and subsequent hospitals should be combined for national reporting.

CODE 9 Not known

This code identifies patients removed from the waiting list for reasons unknown.

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: To be provided at the state level. Public or registered non-profit services and organisations with centralised, statewide or national public health or monitoring services. These include programs concerned primarily with preventing the occurrence of diseases and mitigating their effect, and includes such activities as mass chest X-ray campaigns, immunisation and vaccination programs, control of communicable diseases, ante-natal and post-natal clinics, preschool and school medical services, infant welfare clinics, hygiene and nutrition advisory services, food and drug inspection services, regulation of standards of sanitation, quarantine services, pest control, anti-cancer, anti-drug and anti-smoking campaigns and other programs to increase public awareness of disease symptoms and health hazards, occupational health services, Worksafe Australia, the Australian Institute of Health and Welfare and the National Health and Medical Research Council.

Included here would be child dental services comprising expenditure incurred (other than by individual establishments) or dental examinations, provision of preventive and curative dentistry, dental health education for infants and school children and expenditure incurred in the training of dental therapists.

Record values up to hundreds of millions of dollars.

Comments: Resources Working Party members were concerned about the possibility of double-counting of programs at the hospital and again at the state level and were also concerned at the lack of uniformity between states. Where possible expenditure relating to programs operated by hospitals should be at the hospital level.

Recurrent expenditure (mental health)—non-salary operating costs

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment (mental health)—recurrent expenditure (non-salary operating costs) (financial year), total Australian currency N[N(8)]

Synonymous names: Non-salary operating costs excluding depreciation

METeOR identifier: 287979

Registration status: Health, Standard 08/12/2004

Definition: Total expenditure by a mental health establishment relating to non-salary operating items.

Data Element Concept: Establishment—recurrent expenditure (non-salary operating costs)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Report all expenditure in thousands of dollars (i.e. $ 000's).

Expenditure should include both the specific costs directly associated with the service and indirect costs, for example personnel services.

Research and academic units that function as an integral part of ambulatory care should be reported against the appropriate service.

Depreciation is to be excluded from the non-salary operating costs.

Collection methods: Non-salary recurrent expenditure, excluding depreciation, is to be reported by service setting (admitted patient care, residential care, ambulatory care).

For the admitted patient care setting non-salary recurrent expenditure, excluding depreciation, is to be disaggregated by specialised mental health service program type and specialised mental health service target population, together.

The sub-components of non-salary recurrent expenditure, and depreciation, are to be reported at the organisation level for the Mental health establishments NMDS. However, if the organisation is not reporting on an accrual basis then it does not need to report depreciation.

Guide for use: Carer consultants are persons employed (or engaged via contract) on a part-time or full-time paid basis to represent the interests of carers and advocate for their needs. This implies the person received a salary or contract fee on a regular basis. It does not refer to arrangements where the carer only received reimbursements of expenses or occasional sitting fees for attendance at meetings.

Collection methods: Note: This code is only to be reported for the Mental Health Establishments NMDS.

For Public hospital establishments NMDS data are to be reported in a category according to specific state and territory arrangements.

Guide for use:	Consumer consultants are persons employed (or engaged via contract) on a part-time or full-time paid basis to represent the interests of consumers and advocate for their needs. This implies the person received a salary or contract fee on a regular basis. It does not refer to arrangements where the consumer only received reimbursements of expenses or occasional sitting fees for attendance at meetings.
Collection methods:	Note: This code is only to be reported for the Mental Health Establishments NMDS. For Public hospital establishments NMDS data are to be reported in a category according to specific state and territory arrangements.

Technical name:	Establishment—recurrent expenditure (Department of Veterans' Affairs funded), total Australian currency N[N(8)]
METeOR identifier:	377992
Registration status:	Health, Standard 02/12/2009
Definition:	Total recurrent expenditure measured in Australian dollars funded by block grants or activity payments provided by the Department of Veterans' Affairs (DVA) for provision of mental health services and payments made for mental health treatment and care of DVA clients.
Data Element Concept:	Establishment—recurrent expenditure (Department of Veterans' Affairs funded)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Currency
Format:	N[N(8)]
Maximum character length:	9
Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:

Australian dollars. Rounded to nearest whole dollar.

Collection methods:

DVA-funded expenditure to be reported only once and for the specific statistical unit level at which the expenditure is available.

Where DVA-funded expenditure could be allocated to more than one level it is important to allocate it to the single most appropriate statistical unit level to avoid the possibility of counting the expended funds more than once. For example, funding provided for service delivery expenditure should be reported at the lowest statistical unit level possible only.

Recurrent expenditure—depreciation

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—recurrent expenditure (depreciation) (financial year), total Australian currency N[N(8)]

METeOR identifier: 270279

Registration status: Health, Standard 01/03/2005

Definition: Depreciation charges measured in Australian dollars for a financial year.

Data Element Concept: Establishment—recurrent expenditure (depreciation)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Record values up to hundreds of millions of dollars. Rounded to the nearest whole dollar.

Depreciation is to be reported by service setting (admitted patient care, residential care, ambulatory care).

For admitted patient care settings, depreciation is to be disaggregated by specialised mental health service program type and specialised mental health service target population, together.

Comments: With the long-term trend towards accrual accounting in the public sector, this metadata item will ultimately become significant for public sector establishments. Public sector establishments in some states have adopted modified accrual accounting identifying depreciation only, before reaching full accrual accounting. Depreciation is now reported for most public sector establishments and should be reported as a separate recurrent expenditure.

Depreciation should be identified separately from other recurrent expenditure categories.

Collection and usage attributes

Guide for use: Record values up to hundreds of millions of dollars. Rounded to the nearest whole dollar.

Gross expenditure should be reported with no revenue offsets, except for inter-hospital transfers.

Comments: The possibility of separating fuel, light and power from domestic services which would bring the overall non-salary recurrent expenditure categories closer to the old Hospitals and Allied Services Advisory Council categories was briefly considered by the Resources Working Party but members did not hold strong views in this area.

Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:	Record values up to hundreds of millions of dollars. Rounded to nearest whole dollar.
Comments:	The item would not have been retained if the data set was restricted to the public sector. In some States, public hospitals may not be permitted to borrow funds or it may be entirely a State treasury matter, not identifiable by the health authority. Even where public sector establishment borrowings might be identified, this appears to be a sensitive area and also of less overall significance than in the private sector.

Recurrent expenditure—non-salary operating costs (excluding depreciation)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment (community mental health)—recurrent expenditure (non-salary operating costs) (financial year), total Australian currency N[N(8)]

METeOR identifier: 270297

Registration status: Health, Standard 01/03/2005

Definition: Total expenditure relating to non-salary operating items, for a financial year.

Data Element Concept: Establishment—recurrent expenditure (non-salary operating costs)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Record values up to hundreds of millions of dollars. Rounded to the nearest whole dollar.

Total is calculated from expenditure including:

- Payments to visiting medical officers
- Superannuation employer contributions (including funding basis)
- Drug supplies
- Medical and surgical supplies
- Food supplies
- Domestic services
- Repairs and maintenance
- Patient transport
- Administrative expenses
- Interest payments

- Depreciation
- Other recurrent expenditure.

Expenditure should include both the specific costs directly associated with the service and indirect costs for example personnel services.

Research and academic units that function as an integral part of ambulatory care should be reported against the appropriate service.

Format:	N[N(8)]
Maximum character length:	9
Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:

Australian dollars. Rounded to nearest whole dollar.

Includes expenditure where the funding is from nursing home and hostel subsidies for the care of patients in specialised mental health services, and any other special purpose grants including rural health support, education and training funds and incentive package funds made available under the Australian Health Care Agreements.

Excludes expenditure funded by the Commonwealth under grants from the Department of Veterans' Affairs or from the National Mental Health Strategy.

Collection methods:

Other Commonwealth Government-funded expenditure to be reported only once and for the specific statistical unit level at which the expenditure actually occurred e.g. at the state, regional or organisational level.

Where other Commonwealth Government-funded expenditure could be allocated to more than one level it is important to allocate it to the single most appropriate statistical unit level to avoid the possible of counting the expended funds more than once. For example, funding provided for service delivery expenditure should be reported at the lowest statistical unit level possible only.

Guide for use:	Australian dollars. Rounded to nearest whole dollar.
Collection methods:	Expenditure funded from recoveries to be reported only once and for the specific statistical unit level at which the expenditure actually occurred e.g. at the state, regional or organisational level. Where expenditure funded from recoveries could be allocated to more than one level it is important to allocate it to the single most appropriate statistical unit level to avoid the possible of counting the expended funds more than once. For example, recoveries received through service delivery expenditure should be reported at the lowest statistical unit level possible only.

Recurrent expenditure—repairs and maintenance

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—recurrent expenditure (repairs and maintenance) (financial year), total Australian currency N[N(8)]

METeOR identifier: 269970

Registration status: Health, Standard 01/03/2005

Definition: The costs in Australian dollars incurred in maintaining, repairing, replacing and providing additional equipment, maintaining and renovating building and minor additional works, for a financial year.

Data Element Concept: Establishment—recurrent expenditure (repairs and maintenance)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Record values up to hundreds of millions of dollars. Rounded to nearest whole dollar.

Expenditure of a capital nature should not be included here.

Do not include salaries and wages of repair and maintenance staff. Gross expenditure should be reported with no revenue offsets (except for inter-hospital transfers).

Recurrent expenditure—superannuation employer contributions

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Establishment—recurrent expenditure (superannuation employer contributions) (financial year), total Australian currency N[N(8)]

METeOR identifier: 270371

Registration status: Health, Standard 01/03/2005

Definition: Contributions paid in Australian dollars or (for an emerging cost scheme) that should be paid (as determined by an actuary) on behalf of establishment employees either by the establishment or a central administration such as a state health authority, to a superannuation fund providing retirement and related benefits to establishment employees, for a financial year.

Data Element Concept: Establishment—recurrent expenditure (superannuation employer contributions)

Value domain attributes

Representational attributes

Representation class: Total

Data type: Currency

Format: N[N(8)]

Maximum character length: 9

Unit of measure: Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use: Record as currency up to hundreds of millions of dollars. Rounded to nearest whole dollar.

Comments: The definition specifically excludes employee superannuation contributions (not a cost to the establishment) and superannuation final benefit payments.

In private enterprise some superannuation schemes are partially funded but this is considered too complex a distinction for national minimum data sets.

It is noted that the emergence of salary sacrifice schemes allows employees to forego salary for higher superannuation contributions. If these become significant, national minimum data sets may have to take them into account at a future stage.

Recurrent expenditure—total

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—recurrent expenditure (financial year), total Australian currency N[N(8)]
METeOR identifier:	288993
Registration status:	Health, Standard 08/12/2004
Definition:	Expenditure relating to salaries and wages, non-salary recurrent expenditure and depreciation for a financial year.
Data Element Concept:	Establishment—recurrent expenditure

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Currency
Format:	N[N(8)]
Maximum character length:	9
Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:

Australian dollars. Rounded to nearest whole dollar.

Total is calculated from expenditure including: salaries and wages; depreciation; and non-salary recurrent expenditure comprising: payments to visiting medical officers; superannuation employer contributions (including funding basis); drug supplies; medical and surgical supplies; food supplies; domestic services; repairs and maintenance; patient transport; administrative expenses; interest payments; and other recurrent expenditure.

Collection methods:

The total grant made to non-government residential mental health services and specialised mental health services provided by private hospitals that receive state or territory government funding. Can be reported as the total recurrent expenditure if detailed expenditure data are not available.

METeOR identifier: 407187

Registration status: Health, Standard 07/12/2011

Definition: The appellation by which an administrative region is known or called, as represented by text.

Data Element Concept: Establishment—region name

Value domain attributes

Representational attributes

Representation class: Text

Data type: String

Format: XXX[X(57)]

Maximum character length: 60

Data element attributes

Collection and usage attributes

Guide for use: The name of regions are determined by the relevant state or territory. The region refers to an administrative concept, not a geographical one, because the intent is to capture expenditure and other related data. States and territories may have one or more regions into which the state or territory is divided and to which its service organisations belong. In those cases, region should be reported using the Region identifier data element. In the smaller states or territories there may only be one or no region. In these cases, the region name would repeat the name of the state or territory.

Region of first recurrence as distant metastasis

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—region of first recurrence as distant metastasis, topography code (ICD-O-3) ANN.N

METeOR identifier: 393854

Registration status: Health, Standard 07/12/2011

Definition: The region of first recurrence as a distant metastasis in a person with cancer, after a disease-free period, as represented by a code.

Data Element Concept: Person with cancer—region of first recurrence as distant metastasis

Value domain attributes

Representational attributes

Classification scheme: International Classification of Diseases for Oncology 3rd edition

Representation class: Code

Data type: String

Format: ANN.N

Maximum character length: 5

Collection and usage attributes

Guide for use: Record all four alphanumeric characters of the topography code. The number after the decimal point represents the subsite or subcategory.

Data element attributes

Collection and usage attributes

Guide for use: This information is collected for the site or region of first recurrence as distant metastasis.

The term recurrence refers to the return, reappearance or metastasis of cancer of the same histology after a disease-free period.

Distant metastasis refers to the spread of cancer of the same histology as the original (primary) tumour to distant organs or distant lymph nodes.

Site or region refers to the anatomical location that the cancer has spread to.

Distant metastasis may occur in more than one site; record all relevant distant metastatic sites.

The region of locoregional recurrence is collected as a separate item.

The record should not be updated with subsequent recurrences.

Collection methods: The information should be obtained from the patient's medical record.

Comments: This is collected to identify in which anatomical structures recurrence occurs, and is useful for evaluating patterns of care and patient outcomes.

Collection and usage attributes

Guide for use:

Record all four alphanumeric characters of the topography code. The number after the decimal point represents the subsite or subcategory.

Data element attributes

Collection and usage attributes

Guide for use:

This information is collected for the site or region of the first recurrence as locoregional cancer.

The term recurrence refers to the return, reappearance or metastasis of cancer of the same histology after a disease-free period.

Locoregional recurrence refers to the appearance of cancer cells at the same site as the original (primary) tumour or the regional lymph nodes. A list of those lymph nodes defined as regional lymph nodes for each cancer site can be found in the TNM Classification of Malignant Tumours International Union Against Cancer (UICC) and the

American Joint Committee on Cancer (AJCC) Cancer Staging Manual; the latest editions are recommended.

Site or region refers to the anatomical position that the cancer has reappeared, record all relevant locoregional sites.

The region of recurrence of distant metastasis is collected as a separate item.

The record should not be updated with subsequent recurrences.

Collection methods: The information should be obtained from the patient's medical record.

Comments: This is collected to identify in which anatomical structures recurrence occurs, and is useful for evaluating patterns of care and patient outcomes.

Regional lymph nodes positive

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person with cancer—number of positive regional lymph nodes, total N[N]

METeOR identifier: 415959

Registration status: Health, Standard 07/12/2011

Definition: The total number of regional lymph nodes reported to contain tumour in a person with cancer.

Data Element Concept: Person with cancer—number of positive regional lymph nodes

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: A list of which lymph nodes are defined as regional lymph nodes for each cancer site may be found in the current edition of the TNM Classification of Tumours, UICC (International Union Against Cancer) and the AJCC (American Joint Committee on Cancer) Cancer Staging Manual.

The number includes all positive nodes regardless of whether they were removed and examined at a single or multiple procedures. For example, for breast cancer, record the sum of positive nodes detected in node sampling/sentinel node biopsy and those removed at axillary clearance.

Collection methods: The information should be obtained from the patient's medical record.

For cancer registries, collection of this data item should only be from notification and pathology reports relating to initial diagnosis and not for recurrent or metastatic disease.

Regular client indicator

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—regular client indicator, yes/no code N

METeOR identifier: 436639

Registration status: Community Services, Standard 06/02/2012
Health, Standard 07/12/2011

Definition: An indicator of whether a person is a regular client of an organisation or agency, as represented by a code.

Data Element Concept: Person—regular client indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Boolean

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Yes

A person is a regular client of the organisation or agency.

CODE 2 No

A person is not a regular client of the organisation or agency.

Collection methods: The definition of a regular client can vary depending on the context and/or collection in which the term is being applied, but generally involves a minimum number of visits to an organisation or agency or uses of a facility, occurring over a specific period of time. For example, in the primary health care context a regular client may be someone who has visited a particular primary health care provider 3 or more times in the last 2 years.

In some cases, a visit may be further defined as an attendance at the organisation or agency that leads to either the creation of a new client record or the updating of an existing client record in the client management system of the organisation or agency.

The applicable number of visits to the organisation or agency and the period of time over which those visits need to take place in order for a person to be identified as a regular client should be specified in an appropriate data set specific instruction.

Renal disease therapy

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—renal disease therapy, code N
METeOR identifier:	270264
Registration status:	Health, Standard 01/03/2005
Definition:	The therapy the person is receiving for renal disease, as represented by a code.
Data Element Concept:	Person—renal disease therapy

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Drugs for modification of renal disease
2	Drugs for treatment of complications of renal disease
3	Peritoneal dialysis
4	Haemodialysis
5	Functioning renal transplant

Collection and usage attributes

Guide for use:

CODE 1 Drugs for modification of renal disease

This code is used to indicate drugs for modification of renal disease, includes drugs intended to slow progression of renal failure. Examples include antiproteinurics such as angiotensin converting enzyme inhibitors (ACEI), angiotensin II receptor antagonists (ATRA) and immunosuppressants.

CODE 2 Drugs for treatment of complications of renal disease

This code is used to indicate drugs for the treatment of the complications of renal disease. Examples include antihypertensive agents and drugs that are intended to correct biochemical imbalances caused by renal disease (e.g. loop diuretics, ACEI, erythropoietin, calcitriol, etc).

CODE 3 Peritoneal dialysis

This code is used to indicate peritoneal dialysis, chronic peritoneal dialysis, delivered at home, at a dialysis satellite centre or in hospital.

CODE 4 Haemodialysis

This code is used to indicate haemodialysis, chronic haemodialysis delivered at home, at a dialysis satellite centre or in hospital.

CODE 5 Functioning renal transplant

This code is used to indicate functioning renal transplant, the presence of a functioning renal transplant.

Data element attributes

Collection and usage attributes

Guide for use: More than one code can be recorded.

Collection methods: To be collected on commencement of treatment and regularly reviewed.

Reserve placement date

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Medical indemnity claim management episode—reserve placement date, DDMMYYYY
METeOR identifier:	329690
Registration status:	Health, Standard 07/12/2011
Definition:	The date on which the **reserve** was first placed against a medical indemnity claim, expressed as DDMMYYYY.
Data Element Concept:	Medical indemnity claim management episode—reserve placement date

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	DDMMYYYY
Maximum character length:	8

Data element attributes

Collection and usage attributes

Guide for use:

The reserve placement date must be the same as or after the date the health-care incident occurred.

The reserve may be adjusted during the lifetime of a claim. However, the date(s) when the reserve was adjusted should not be reported.

This data element should be used in conjunction with the data element: *Date—accuracy indicator, code AAA* to flag whether each component in the date is accurate, estimated or unknown.

Comments:

This date is of particular significance in the context of the Medical Indemnity National Collection (MINC) as the placing of a reserve against a matter indicates when it was considered likely to materialise in a medical indemnity claim and so is required to have occurred for a claim to be reported to the MINC.

Residential service unit identifier

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Specialised mental health service—residential service unit identifier, XXXXXX

METeOR identifier: 404837

Registration status: Health, Standard 07/12/2011

Definition: A unique identifier for a specialised mental health residential service unit, as represented by a combination of numeric and/or alphabetic characters.

Data Element Concept: Specialised mental health service—residential service unit identifier

Value domain attributes

Representational attributes

Representation class: Identifier

Data type: String

Format: XXXXXX

Maximum character length: 6

Data element attributes

Collection and usage attributes

Guide for use: For the residential service setting, as a minimum, 24-hour staffed residential services that employ mental health trained staff on-site 24 hours per day and other services with less intensive staffing (but the trained staff on-site for a minimum of 6 hours a day and at least 50 hours per week) should be defined as separate service units. This applies to both government-operated residential services and government-funded residential services operated by non-government organisations. In addition, residential service units should be differentiated by target population. Residential services would be separately identifiable as service units using the *Specialised mental health service—target population group, code N* data element. For additional information, please refer to the glossary item **Residential mental health care service**.

The complete identifier string, including State/Territory identifier, Region identifier, Organisation identifier, Service unit cluster identifier and Residential service unit identifier, should be a unique code for the service unit in that state/territory. Service unit reporting structures should be identical between all mental health collections (e.g., Mental Health National Minimum Data Sets and the Mental Health National Outcomes and Casemix Collection (NOCC)).

Residual expenditure (mental health service)—academic positions

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Specialised mental health service—residual expenditure (academic positions), total Australian currency N[N(8)]
METeOR identifier:	290151
Registration status:	Health, Standard 08/12/2004
Definition:	Expenditure in Australian dollars by specialised mental health services that cannot be directly related to programs operated by a particular organisation or service unit (that is, can only be indirectly related to a particular organisation or service unit). Academic positions refer to grants from the organisation, region or state/territory administration to academic institutions for the establishment and maintenance of academic positions in psychiatry or related disciplines. This item also includes the costs of the other academic positions associated with the professional position where these are financed from within the organisation, region or central administration's recurrent budget.
Data Element Concept:	Specialised mental health service—residual expenditure (academic positions)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Currency
Format:	N[N(8)]
Maximum character length:	9
Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:	Excludes grants to non-government organisations for services that are to be reported separately. These are grants for accommodation services, advocacy services, community awareness services, counselling services, independent living skills support services, pre-vocational training services, psychosocial support services, recreational services, respite

services, self-help support group services and other unspecified services grants.

This item also includes the costs of the other academic positions associated with the professional position where these are financed from within the organisation, region or central administration's recurrent budget.

Collection methods:

Residual mental health expenditure is to be reported only at the level at which the expenditure occurred (state/territory, region or organisational), and should not be counted at more than one level. Expenditure should be reported for these categories, where applicable:

- Report academic expenditure in this section only where the academic unit operates independently. Where the academic unit or position operates as an integral part of the service (e.g. an acute inpatient unit), the expenditure should be reported for the relevant organisation.
- Where academic grants are paid directly by organisation, region or state/territory administration, these should be reported at that level.

Registration status: Health, Standard 08/12/2004

Definition: Expenditure in Australian dollars by specialised mental health services that cannot be directly related to programs operated by a particular organisation or service unit (that is, can only be indirectly related to a particular organisation or service unit). It refers to costs of administration and other support services (such as program management, admissions reception office, medical records etc.) at the mental health program-level (i.e. at state or territory, region or organisation level). Generally, these are resources that are specifically dedicated to the mental health program, are under the direct management control of the program and are funded by the program.

Data Element Concept: Specialised mental health service—residual expenditure (program administration)

Data element attributes

Collection and usage attributes

Guide for use: Generally, these are resources that are specifically dedicated to the mental health program, are under the direct management control of the program and are funded by the program.

Excludes grants to non-government organisations for services that are to be reported separately. These include grants for accommodation services, advocacy services, community awareness services, counselling services, independent living skills support services, pre-vocational training services, psychosocial support services, recreational services, respite services, self-help support group services and other unspecified services grants.

Collection methods: Residual mental health expenditure is to be reported only at the level at which the expenditure occurred (state/territory, region or organisational), and should not be counted at more than one level. Expenditure should be reported for these categories, where applicable:

Do not count these costs if they have been included in the expenditure reported by service delivery organisations within the region.

Guide for use:

CODE 1 RETIRED

This category includes persons who have retired from working or looking for work in the registered profession, and who do not intend to look for or take up work in the registered profession in the future. This definition is based on the ABS definition of 'retired from the labour force', as used in the ABS Retirement and Retirement Intentions survey.

CODE 2 NOT RETIRED

All persons who are not 'retired' as defined above.

Data is self-reported based on the retirement status in the registered profession in the week before registration.

The data element is only applicable to health professionals who are not employed in the registered profession in Australia.

Unit of measure:	Australian currency (AU$)

Data element attributes

Collection and usage attributes

Guide for use:

Record as currency up to hundreds of millions of dollars. Rounded to nearest whole dollar.

This metadata item relates to all revenue received by establishments except for general revenue payments received from state or territory governments.

Comments:

The Resources Working Party had considered splitting recoveries into staff meals and accommodation, and use of hospital facilities (private practice) and other recoveries.

Some states had felt that use of facilities was too sensitive as a separate identifiable item in a national minimum data set. Additionally, it was considered that total recoveries was an adequate category for health financing analysis purposes at the national level.

Data element attributes

Collection and usage attributes

Guide for use:

Within a road name it is possible to find what appears to be a Road type (e.g. The Boulevard). It is also possible to have a null Road type. This data element relates to the road name only.

Usage Examples:

BROWNS ROAD WEST
In this case the Road name is BROWNS, the Road type is RD and the Road suffix is W

THE AVENUE WEST
In this case the Road name is THE AVENUE, the Road type is null and the Road suffix is W

COTSWOLD BRETT
In this case the Road Name is COTSWOLD BRETT and the Road type is null

HIGH STREET ROAD
In this case the Road Name is HIGH STREET and the Road type is RD.

This data element is one of a number of items that can be used to create a primary address, as recommended by the

AS 4590-2006 *Interchange of client information* standard.
Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)
- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable).

Satisfaction with participation

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—level of satisfaction with participation in a life area, code N

METeOR identifier: 320216

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: The degree to which a person is satisfied with their involvement in a specified life area, as represented by a code.

Context: Human functioning and disability

Data Element Concept: Person—level of satisfaction with participation in a life area

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

	Value	Meaning
Permissible values:	0	High satisfaction with participation
	1	Moderate satisfaction with participation
	2	Neither satisfied nor dissatisfied with participation
	3	Moderate dissatisfaction with participation
	4	Extreme dissatisfaction with participation
	5	Complete restriction and dissatisfaction
Supplementary values:	8	Not specified
	9	Not applicable

Collection and usage attributes

Guide for use: This metadata item contributes to the definition of the concept '**Disability**' and gives an indication of the experience of disability for a person.

In the context of health, participation is involvement in a life situation. Participation restrictions are problems an individual may experience in involvement in life situations.

This metadata item gives a rating of the person's degree of satisfaction with participation in a domain of life, in relation to their current life goals. Satisfaction with participation corresponds to the person's own perspective on their participation, and reflects their attitude to their participation in the various life areas. It is essentially a summary measure in which are embedded the concepts of choice, opportunity and importance.

CODE 0 High satisfaction with participation

Used if a person is involved in the specified life situation as he or she wishes to fulfil his or her current life goals in terms of duration, frequency, manner and outcome.

CODE 1 Moderate satisfaction with participation

Used if the person is reasonably satisfied with their participation in this life situation, in terms of duration, frequency, manner and outcome. This could occur if one of the criteria (duration, frequency, manner or outcome) is not fulfilled and that criterion is not critical to the person's goals. For example, the person does not participate in the specified life situation as frequently as wished, but the other criteria are met and the frequency is not so affected that it is critical to the person's satisfaction.

CODE 2 Neither satisfied nor dissatisfied with participation

Used if the person is neither satisfied nor dissatisfied with their participation in this life situation, in terms of duration, frequency, manner and outcome.

CODE 3 Moderate dissatisfaction with participation

Used if two or three criteria (duration, frequency, manner or outcome) are not fulfilled, but are not so badly affected, in relation to the person's goals in that life area, that the person is extremely dissatisfied. For example, a person is able to participate in work, but is placed in supported employment rather than employment in the open labour market. This is not in line with the person's goals, so that the manner and outcome of the participation are not fulfilled.

CODE 4 Extreme dissatisfaction with participation

Used when all criteria (duration, frequency, manner and outcome) are not fulfilled for the specified life situation, or where any of the criteria are so badly affected in relation to the person's goals that they consider themselves to be extremely dissatisfied with this life area. An example of the latter would arise when a person is extremely dissatisfied with participation in interpersonal activities because his/her goal in terms of duration of social visits is never fulfilled, although other criteria (frequency and manner) may be fulfilled.

CODE 5 Complete restriction and dissatisfaction

Used when the person does not participate in this life situation in line with his or her own goals, i.e. in an area where they wish to participate and is completely dissatisfied with not participating in this life situation.

CODE 9 Not applicable

Used when participation in a life situation is not relevant, such as employment of an infant or where there is no participation and the person has no desire to participate in this area. For example, a personal preference not to participate in specific areas of community, social and civic life such as sport or hobbies. The area may not be applicable to the person's current life goals.

Data element attributes

Collection and usage attributes

Guide for use: Satisfaction with participation should be coded from the perspective of the person. This data element should be coded in conjunction with the Person—activities and participation life area, code (ICF 2001) AN[NNN] data element. For example, a person's 'moderate satisfaction with participation in exchange of information'.

Scheduled admission date

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Admitted patient care waiting list episode—scheduled admission date, DDMMYYYY

METeOR identifier: 269978

Registration status: Health, Standard 01/03/2005

Definition: The date on which it is proposed that a patient on the waiting list will be admitted for an episode of care.

Data Element Concept: Admitted patient care waiting list episode—scheduled admission date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Comments: If this metadata item were to be used to compare different hospitals or geographical locations, it would be necessary to specify when the scheduled date is to be allocated (for example, on addition to the waiting list).

This metadata item is required for the purposes of hospital management - allocation of beds, operating theatre time and other resources.

Separation date

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of admitted patient care—separation date, DDMMYYYY

METeOR identifier: 270025

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: Date on which an admitted patient completes an episode of care.

Data Element Concept: Episode of admitted patient care—separation date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Comments: There may be variations amongst jurisdictions with respect to the recording of separation date. This most often occurs for patients who are statistically separated after a period of leave (and who do not return for further hospital care). In this case, some jurisdictions may record the separation date as the date of statistical **separation** (and record intervening days as leave days) while other jurisdictions may retrospectively separate patients on the first day of leave. Despite the variations in recording of separation date for this group of patients, the current practices provide for the accurate recording of length of stay.

Maximum character length:	1

Permissible values:

Value	Meaning
1	In person
2	Telephone
3	Videoconference
4	Electronic mail
5	Postal/courier service
8	Other

Collection and usage attributes

Guide for use:

CODE 1 In person

The healthcare provider delivers the service in the physical presence of the patient (i.e., in the same room). Codes 1 and 3 provide a measure of 'face-to-face' service delivery.

CODE 2 Telephone

The healthcare provider delivers the service using a telephone. This includes teleconference.

CODE 3 Videoconference

The healthcare provider delivers the service using videoconference equipment. Codes 1 and 3 provide a measure of 'face-to-face' service delivery.

CODE 4 Electronic mail

The healthcare provider delivers the service via electronic mail.

CODE 5 Postal/courier service

The healthcare provider delivers the service via postal (including courier) services.

Comments: Guide for use sourced from Queensland Health (data element QHLTH 040780).

Data element attributes

Collection and usage attributes

Collection methods: The mode is from the point of view of the patient in relation to the healthcare provider who records the service event in the patient's medical record.

Service request source

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Non-admitted patient service request—service request source, code N.N

METeOR identifier: 400747

Registration status: Health, Standard 06/10/2010

Definition: The person or organisation that requests a service for a non-admitted patient from a healthcare provider, as represented by a code.

Data Element Concept: Non-admitted patient service request—service request source

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: N.N

Maximum character length: 3

Permissible values:

Value	Meaning
	THIS HOSPITAL
1.1	Other outpatient clinic
1.2	Emergency department
1.3	Elsewhere in this hospital
2.0	Other hospital
	NON-HOSPITAL
3.1	General practice
3.2	Specialist practice
3.3	Other non-hospital
4.0	Self

Collection and usage attributes

Guide for use: Service requests include both referral (e.g. a written referral from a general practitioner), and other informal requests for service (e.g. self-referral for an unplanned 'walk-in' service).

The service request should not be from another provider within the same outpatient clinic but from an organisation external to the outpatient clinic.

A client/patient may be referred (by Unit A) for services to an organisation that has multiple registered health service units. That client/patient may then be referred from one health service unit (Unit B) within the organisation to another (Unit C). In these circumstances the 'source of referral' for Unit C is Unit B (not Unit A). For example if a patient is referred by his/her GP to a general medical clinic, such as an aged care clinic, then after assessment at this clinic the physician refers the patient to an allied health clinic, the service request source for the allied health outpatient clinic is 'Other outpatient clinic', whereas the service request source for the general medical clinic is 'General Practice'.

THIS HOSPITAL

The service request has come from some other part of the hospital with the same establishment ID.

CODE 2.0 Other hospital

The service request has come from a hospital with a different establishment ID.

Data type:	Number
Format:	N[N]
Maximum character length:	2

Permissible values:

Value	Meaning
1	Allied health and/or clinical nurse specialist
2	Dental
3	Imaging
4	Medical
5	Obstetrics and gynaecology
6	Paediatrics
7	Pathology
8	Pharmacy
9	Psychiatric
10	Surgical
11	Emergency department

Collection and usage attributes

Guide for use:

The following provides a guide to types of clinical services that are included in each of the categories in the data domain. Clinical services that are not specifically identified in this Guide for use should be classified as one of the groups in the data domain on the basis of the type of clinical professional staff involved in providing the service event.

In paediatric hospitals, the full range of service types should be used. That is, paediatric medical should be reported as medical and paediatric surgical should be reported as surgical.

Clinical service type	**Clinical service examples**
Allied health and/or clinical nurse specialist	Audiology Clinical pharmacy Diabetes education Neuropsychology Nutrition/dietetics Occupational therapy Optometry Orthoptics Orthotics Physiotherapy Podiatry Prosthetics Psychology Social work Speech pathology Stomal therapy Wound management
Dental	Dental
Imaging	Medical imaging
Medical	Aged care Alcohol and other drug Allergy Anti-coagulant Asthma Cardiology Clinical measurement Dermatology Dementia Developmental disabilities Diabetes Endocrine Epilepsy Falls Gastroenterology General internal medicine Genetic Haematology

	Hepatobiliary Hypertension Hyperbaric medicine Immunology Infectious diseases Medical oncology Metabolic bone Nephrology Neurology Occupational medicine Palliative care Pain management Pulmonary Radiation oncology Rehabilitation Respiratory Rheumatology Spinal Transplants
Obstetrics and gynaecology	Family planning Gynaecology Gynaecology oncology Obstetrics
Pathology	Pathology
Paediatrics	Adolescent health Neonatal Paediatric medicine Paediatric surgery
Pharmacy	Dispensing pharmacy
Psychiatric	Psychiatry
Surgical	Breast Burns Cardiac surgery Colorectal Craniofacial Ear, nose and throat Fracture General surgery Neurosurgery Ophthalmology Orthopaedics Plastic surgery Pre-admission Pre-anaesthesia Thoracic surgery Urology Vascular surgery

Emergency department	Emergency department

An emergency department provides triage, assessment, care and/or treatment for patients suffering from medical condition/s and/or injury.

Service unit cluster identifier

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—service unit cluster identifier, XXXXX
METeOR identifier:	404858
Registration status:	Health, Standard 07/12/2011
Definition:	A unique identifier for a service unit cluster, which groups specialised mental health ambulatory and residential service units, as represented by a combination of numeric and/or alphabetic characters.
Data Element Concept:	Establishment—service unit cluster identifier

Value domain attributes

Representational attributes

Representation class:	Identifier
Data type:	String
Format:	XXXXX
Maximum character length:	5

Data element attributes

Collection and usage attributes

Guide for use:

A *Specialised mental health service organisation* may consist of one or more clusters of service units providing services in admitted patient, residential and ambulatory settings. For example, a *Specialised mental health service organisation* may consist of several hospitals (clusters of admitted patient service units) and/or ambulatory or residential service unit clusters (for example, a cluster of child and adolescent ambulatory service units, and a cluster of aged residential service units).

To allow service units to be individually identified, but still also to be identified as part of a hospital (for the admitted patient service setting), or as part of another type of cluster (e.g. other cluster types for ambulatory or residential service setting), a separate reporting level called *Hospital* for admitted patient service units and *Service unit cluster* for ambulatory service units and residential service units is necessary.

The concept of *Service unit cluster* only applies to ambulatory and residential service units. The equivalent entity for the grouping of admitted patient service units is the *Hospital*.

However, for some ambulatory service units, the service unit may 'belong' to a hospital that contains both admitted patient and ambulatory service units. In this instance, the service unit cluster identifier for the ambulatory service unit would be the 'hospital identifier'. Other groups of ambulatory and residential service units could also be usefully identified as clusters. For example, clusters may exist of groups of residential services for aged persons, or groups of ambulatory service units in particular geographical areas.

The complete identifier string, including State/Territory identifier, Region identifier, Organisation identifier and Service unit cluster identifier, should be a unique code for the cluster in that state/territory. Service unit reporting structures should be identical between all mental health collections (e.g., Mental Health National Minimum Data Sets and the Mental Health National Outcomes and Casemix Collection (NOCC)). If no cluster applies, set to 00000.

Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

Diagnosis and procedure codes should be checked against the national ICD-10-AM sex edits, unless the person is undergoing, or has undergone a sex change or has a genetic condition resulting in a conflict between sex and ICD-10-AM code.

CODE 3 Intersex or indeterminate

Intersex or indeterminate, refers to a person, who because of a genetic condition, was born with reproductive organs or sex chromosomes that are not exclusively male or female or whose sex has not yet been determined for whatever reason.

Intersex or indeterminate, should be confirmed if reported for people aged 90 days or greater.

Comments: The definition for Intersex in Guide for use is sourced from the ACT Legislation (Gay, Lesbian and Transgender) Amendment Act 2003.

Data element attributes

Collection and usage attributes

Collection methods: Operationally, sex is the distinction between male and female, as reported by a person or as determined by an interviewer.

When collecting data on sex by personal interview, asking the sex of the respondent is usually unnecessary and may be inappropriate, or even offensive. It is usually a simple matter to infer the sex of the respondent through observation, or from other cues such as the relationship of the person(s) accompanying the respondent, or first name. The interviewer may ask whether persons not present at the interview are male or female.

A person's sex may change during their lifetime as a result of procedures known alternatively as sex change, gender reassignment, transsexual surgery, transgender reassignment or sexual reassignment. Throughout this process, which may be over a considerable period of time, the person's sex could be recorded as either Male or Female.

In data collections that use the ICD-10-AM classification, where sex change is the reason for admission, diagnoses should include the appropriate ICD-10-AM code(s) that clearly identify that the person is undergoing such a process. This code(s) would also be applicable after the person has completed such a process, if they have a procedure involving an organ(s) specific to their previous sex (e.g. where the patient has prostate or ovarian cancer).

CODE 3 Intersex or indeterminate

Is normally used for babies for whom sex has not been determined for whatever reason.

Should not generally be used on data collection forms completed by the respondent.

Should only be used if the person or respondent volunteers that the person is intersex or where it otherwise becomes clear during the collection process that the individual is neither male nor female.

CODE 9 Not stated/inadequately described

Is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Guide for use: Public sector

CODE 101 Australian Health Care Agreements

This item is not currently required to be reported by state or territory health authorities.

Revenue received from the Australian Government Department of Health and Ageing under the Australian Health Care Agreements to assist in the cost of providing public patients with free access to public hospital services within a clinically appropriate time irrespective of where patients live.

CODE 102 Other Special Purpose Payments

This item is not currently required to be reported by state or territory health authorities.

Includes Specific Purpose Payments provided by the Australian Government to the states and territories such as:

- Public Health Outcomes Funding Agreement grants
- Highly Specialised Drugs grants
- National Radiotherapy grants
- National Mental Health Information Development grant
- Magnetic Resonance Imaging grants
- Postgraduate Medical Training grants
- Hepatitis C Education and Prevention grant
- Royal Flying Doctor Service grants

Excludes AHCA grants, Medicare or PBS/RPBS payments.

CODE 103 Medicare

This item is not currently required to be reported by state or territory health authorities.

Includes revenue received for services listed in the Medical Benefits Schedule that are provided by registered medical practitioners. Many medical services in Australia are provided on a fee-for-service basis and attract benefits or revenue from the Australian Government under Medicare.

Includes revenue received for medical services provided to private admitted patients in hospitals as well as some revenue that is not based on fee-for-service (i.e. alternative funding arrangements).

CODE 104 Pharmaceutical Benefits Scheme (PBS) and Repatriation Pharmaceuticals Benefits Scheme (RPBS)

Includes pharmaceuticals in the PBS and RPBS for which the

Australian Government paid a benefit.

Excludes:

- revenue received for pharmaceuticals for which no PBS or RPBS benefit was paid;
- revenue received for other non-pharmaceutical medications;
- pharmaceuticals listed in the PBS or RPBS, the total costs of which are equal to, or less than, the statutory patient contribution for the class of patient concerned;
- medicines dispensed through private prescriptions that do not fulfil the criteria for payment under the PBS or RPBS; and
- over-the-counter medicines such as pharmacy-only medicines, aspirin, cough and cold medicines, vitamins and minerals, herbal and other complementary medicines, and a range of medical non-durables, such as bandages, band aids and condoms.

CODE 105 National Health and Medical Research Council

Includes health research funded by the National Health and Medical Research Council that is not reported elsewhere.

CODE 106 Department of Veterans' Affairs

Includes revenues received for health services provided to veterans, war widows and widowers with gold or white DVA cards. Types of services include public and private hospitals, local medical officers and specialists, residential aged care subsidy, allied health, rehabilitation appliances, dental services, community nursing, Veterans' Home Care and travel for treatment.

Excludes revenues received for pharmaceuticals provided to veterans, war widows and widowers with gold, white or orange DVA cards which are reported under code 104.

CODE 107 Other Australian Government Departments

Includes other revenues received for health services from, for example, the Department of Immigration and Citizenship and Department of Defence. Excludes Medicare payments from Medicare Australia (part of Department of Human Services) reported under code 103.

CODE 108 State/Territory non-health Departments

Includes correctional facilities, and departments that have contributed funding for the provision of a health service e.g. public health, emergency services, NSW Food Authority, NSW Health Care Complaints Commission, South Australia Ambulance Service, National Blood Authority, Red Cross, and prison health services such as WA Health services directorate and St Vincent's Correctional Health Service Victoria.

CODE 188 Other public sector revenue

Includes all public sector revenue other than those reported under codes 101 to 108. May include revenue from Local governments.

Private sector

CODE 201 Private health insurance

Includes revenue from businesses mainly engaged in providing insurance cover for hospital, medical, dental or pharmaceutical expenses or costs.

Excludes:

3. accident and sickness insurance
4. liability insurance
5. life insurance
6. general insurance
7. other insurance business excluded by the Private Health Insurance (Health Insurance Business) Rules
8. overseas visitors for whom travel insurance is the major funding source.

State and territory health authorities may report revenues for admitted patients, from private health insurance funds and private households, as a combined total if these revenues are not able to be reported separately.

CODE 202 Workers compensation insurance

Includes benefits paid under workers compensation insurance to the health industry relevant organisation for health care provided to workers, including trainees and apprentices, who have experienced a work-related injury. Type of benefits includes fees for medical or related treatment.

Excludes benefits paid under public liability, common law or medical negligence.

CODE 203 Motor vehicle third party insurance

Includes personal injury claims arising from motor accidents and compensation for accident victims and their families for injuries or death. Excludes benefits paid under workers compensation insurance, public liability, common law or medical negligence.

CODE 204 Other compensation (e.g. Public liability, common law, medical negligence).

This item is not currently required to be reported by state or territory health authorities.

Includes revenues received from:

- public liability insurance for injury arising from an incident related to the organisation's normal activities;
- a court-ordered settlement for damages because of negligence under specific conditions a duty of care exists and was breached and material damage resulted as a consequence;
- health professionals employed by health authorities or otherwise covered by health authority professional indemnity arrangements; and
- a common law settlement cancels all other entitlements to workers compensation benefits. If a common law claim is not successful, the worker will continue to receive workers

compensation under the statutory scheme.

Excludes benefits paid under motor vehicle third party insurance.

CODE 205 Private households (self-funded and out-of-pocket expenditure)

Includes payments received from the patient, the patient's family or friends, or other benefactors (i.e. patient revenue).

Includes cost-sharing and informal payments to health care providers. Cost-sharing is a provision of health insurance or third-party payment that requires the individual who is covered to pay part of the cost of health care received. This is distinct from the payment of a health insurance premium, contribution or tax which is paid whether health care is received or not.

Cost-sharing can be in the form of co-payments, co-insurance or deductibles:

- co-payment: cost-sharing in the form of a fixed amount to be paid for a service;
- co-insurance: cost-sharing in the form of a set proportion of the cost of a service; and
- deductibles: cost-sharing in the form of a fixed amount which must be paid for a service before any payment of benefits can take place.

CODE 206 Non-profit institutions serving households

Non-profit institutions serving households (NPISHs) (i.e. non-profit NGOs) consist of non-profit institutions which provide goods or services to households free or at prices that are not economically significant. Such NPISHs may provide health care goods or services on a non-market basis to households in need, including households affected by natural disasters or war.

The revenues received from such NPISHs are provided mainly by donations in cash or in kind from the general public, corporations or governments. These include organisations such as the National Heart Foundation, Diabetes Australia or the Cancer Council etc. Excludes non-profit institutions that are market producers of goods and services.

NOTE: This item is to be used for the reporting of revenues received from trusts or charities.

CODE 207 Corporations (other than health insurance)

This item is not currently required to be reported by state or territory health authorities.

Include revenues received from all corporations or quasi-corporations, whose principal activity is the production of market goods or services (other than health insurance). Included are all resident non-profit institutions that are market producers of goods or non-financial services. These include health or health-related organisations such as hospitals, pharmacies, medical and diagnostic laboratories, residential aged care facilities and providers of medical specialist services, and non-health organisations such as research organisations.

CODE 288 Other private sector revenue

Includes all private sector revenue other than those reported under codes 201 to 207.

CODE 301 Overseas

This item is not currently required to be reported by state or territory health authorities.

Includes funds provided from overseas countries for areas of health care such as research. Funds may be channelled through government or non-government organisations or private institutions. Also includes overseas visitors receiving health care for whom travel insurance is the major funding source.

CODE 999 Not further defined

Includes all revenue that could be a combination of categories 101 to 108, 188, 201 to 207 and 288 but which could not be further disaggregated.

Guide for use: If there is an expected source of revenue followed by a finalised actual source of revenue (for example, in relation to compensation claims), then the actual revenue source known at the end of the reporting period should be recorded.

The expected revenue source should be reported if the fee has not been paid but is not to be waived.

Supplementary values:	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 03 Medical practitioner

Includes medical specialists, vocationally registered general practitioners, vocationally registered general practitioner trainees and other primary-care medical practitioners in private practice.

CODE 04 Hospital

Includes public and private hospitals, hospitals specialising in dental, ophthalmic aids and other specialised medical or surgical care, satellite units managed and staffed by a hospital, emergency departments of hospitals, and mothercraft hospitals. Excludes psychiatric hospitals, psychiatric units and drug and alcohol units located within or operating from hospitals, and outpatient clinics (see codes 05-07).

CODE 05 Mental health care service

Includes both residential and non-residential services. Includes psychiatric hospitals and psychiatric units within and outside of hospitals.

CODE 06 Alcohol and other drug treatment service

Includes both residential and non-residential services. Includes drug and alcohol units within and outside of hospitals.

CODE 07 Other community/health care service

Includes outpatient clinics and aged care facilities.

CODE 09 Police diversion

This code should be used when a person detained for a minor drug offence is formally referred to treatment by the police in order to divert the offender from the criminal justice pathway.

CODE 10 Court diversion

This code refers to the diversion of an offender into drug education, assessment and treatment at the discretion of a magistrate. This may occur at the point of bail or prior to sentencing.

CODE 98 Other

Includes persons referred under a legislative act (other than Drug *Diversion Act*) e.g. *Mental Health Act*.

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Acute care
2	Other

Collection and usage attributes

Guide for use:

The categorisation of the admitted patient program is based on the principal purpose(s) of the program rather than the classification of the individual patients.

CODE 1 Acute care

Programs primarily providing specialist psychiatric care for people with acute episodes of mental disorder. These episodes are characterised by recent onset of severe clinical symptoms of mental disorder that have potential for prolonged dysfunction or risk to self and/or others. The key characteristic of acute services is that this treatment effort is focused on short-term treatment. Acute services may be focused on assisting people who have had no prior contact or previous psychiatric history, or individuals with a continuing mental disorder for whom there has been an acute exacerbation of symptoms. This category applies only to services with a mental health service setting of overnight admitted patient care or residential care.

CODE 2 Other

Refers to all other programs primarily providing admitted patient care.

Includes programs providing rehabilitation services that have a primary focus on intervention to reduce functional impairments that limit the independence of patients. Rehabilitation services are focused on disability and the promotion of personal recovery.

They are characterised by an expectation of substantial improvement over the short to mid-term. Patients treated by rehabilitation services usually have a relatively stable pattern of clinical symptoms.

Also includes programs providing extended care services that primarily provide care over an indefinite period for patients who have a stable but severe level of functional impairment and an inability to function independently, thus requiring extensive care and support. Patients of extended care services present a stable pattern of clinical symptoms, which may include high levels of severe unremitting symptoms of mental disorder. Treatment is focused on preventing deterioration and reducing impairment; improvement is expected to occur slowly.

Data element attributes

Collection and usage attributes

Guide for use: This data element is used to disaggregate data on beds, activity, expenditure and staffing for admitted patient settings in mental health service units (see Specialised mental health service—service setting, code N data element).

Permissible values:	Value	Meaning
	1	Admitted patient care setting
	2	Residential care setting
	3	Ambulatory care setting
Supplementary values:	9	Unknown/not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Admitted patient care setting

The component of specialised mental health services that provides admitted patient care. These are specialised psychiatric hospitals and specialist psychiatric units located within hospitals that are not specialised psychiatric hospitals. Excludes hospital outpatient clinics.

CODE 2 Residential care setting

The component of specialised mental health services that provides residential care within **residential mental health services**. Excludes components that provide ambulatory care to patients or clients who are not residents.

CODE 3 Ambulatory care setting

The component of specialised mental health services that provides ambulatory care (service contacts). They include hospital outpatient clinics and non-hospital community mental health services, such as crisis or mobile assessment and treatment services, day programs, outreach services and consultation/liaison services.

Data element attributes

Collection and usage attributes

Guide for use: A single mental health service unit may provide care in more than one setting. This data element is intended to allow staffing, resource and expenditure data related to these settings to be identified and reported separately.

1	Child and adolescent
2	Older person
3	Forensic
4	General
5	Youth

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use:

This data element is used to disaggregate data on beds, activity, expenditure and staffing for patients in mental health service units (see the *Specialised mental health service – service setting, code N* data element).

CODE 1 Child and adolescent

These services principally target children and young people under the age of 18 years. The classification of a service into this category requires recognition by the regional or central funding authority of the special focus of the service. These services may include a forensic component.

CODE 2 Older person

These services principally target people in the age group of 65 years and over. The classification of a service into this category requires recognition by the regional or central funding authority of the special focus of the service. These services may include a forensic component.

CODE 3 Forensic

Health services that provide services primarily for people whose health condition has led them to commit, or be suspected of, a criminal offence or make it likely that they will reoffend without adequate treatment or containment. This includes prison-based services, but excludes services that are primarily for children and adolescents and for older people even where they include a forensic component.

CODE 4 General

These services principally target the general adult population (aged 18–64 years) but may also provide services to children, adolescents or older people. These services are those services that cannot be described as specialist child and adolescent services, youth services or services for older people. It excludes forensic services.

CODE 5 Youth

These services principally target children and young people generally aged 16-24 years. The classification of a service into this category requires recognition by the regional or central funding authority of the special focus of the service. These services may include a forensic component.

The order of priority for coding is:

- where the forensic services are for children/adolescents, youth or older persons these services should be coded to the category for that age group; and
- where the forensic services are for adults these services should be coded to forensic.

Specialised mental health service—hours staffed

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Specialised mental health service—number of hours staffed, average hours NN
METeOR identifier:	288877
Registration status:	Health, Standard 08/12/2004
Definition:	The average number of hours per day during which a residential mental health service has appropriately trained staff employed on-site. Training may include formal qualifications and/or on the job training.
Data Element Concept:	Specialised mental health service—number of hours staffed

Value domain attributes

Representational attributes

Representation class:	Average	
Data type:	Number	
Format:	NN	
Maximum character length:	2	
Supplementary values:	Value	Meaning
	99	Unknown/not stated/inadequately described
Unit of measure:	Hour (h)	

Data element attributes

Collection and usage attributes

Guide for use:

Whole numbers of hours staffed (no decimals or fractions).

Valid numbers are 1 to 24.

The hours staffed provides a measure of service intensity for the reporting and analysis of staff, financial and activity data.

For residential mental health services, this refers to the number of hours per day during which appropriately trained staff (either with formal qualifications and/or on the job training) are employed on site, as their normal place of employment, within the service unit. It excludes periods where the service unit is only staffed by a resident sleepover staff member or any period where staff are present but not employed on site at the service unit.

Excludes ambulatory and admitted patient services.

Round to nearest whole hour.

Where the number of hours staffed varies by day, average the number of hours staffed over a week, including the weekend.

Specialist private sector rehabilitation care indicator

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—specialist private sector rehabilitation care indicator, code N

METeOR identifier: 270397

Registration status: Health, Standard 01/03/2005

Definition: Whether the rehabilitation care that a patient receives from a private hospital meets the criteria for 'Specialist private sector rehabilitation care', as represented by a code.

Data Element Concept: Episode of care—specialist private sector rehabilitation care indicator

Value domain attributes

Representational attributes

Representation class: Code

Data type: Boolean

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: This metadata item is a qualifier of the three 'Rehabilitation' care types for admitted patients in private hospitals. When an admitted patient in a private hospital is receiving rehabilitation care (as defined in Hospital service—care type, code N[N].N), this metadata item should be recorded to denote whether or not that care meets the criteria for 'specialist rehabilitation'.

These are the criteria determined by The Commonwealth Department of Health and Ageing in respect of patients treated in the private sector, specialist rehabilitation is:

- Provided by a specialist rehabilitation unit (a separate physical space and a specialist rehabilitation team providing admitted patient and/or ambulatory care) meeting guidelines issued by the Commonwealth Department of Health and Ageing, and
- provided by a multi-disciplinary team which is under the

clinical management of a consultant in rehabilitation medicine or equivalent, and

- provided for a person with limited functioning (impairments, activity limitations and participation restrictions) and for whom there is a reasonable expectation of functional gain, and
- for whom the primary treatment goal is improvement in functioning status which is evidenced in the medical record by:

  an individualised and documented initial and periodic assessment of functional ability, or

  an individualised multi-disciplinary rehabilitation plan which includes agreed rehabilitation goals and indicative timeframes.

Comments: This metadata item has been developed by the Private Rehabilitation Working Group, and agreed by the private rehabilitation hospital sector, the private health insurance sector and the Commonwealth Department of Health and Ageing. Whilst most patients will be treated by a consultant in rehabilitation medicine (a Fellow of the Australasian Faculty of Rehabilitation Medicine) there are circumstances in which the treating doctor will not be a Fellow of the Faculty. These include, but are not limited to, care provided in geographic areas where there is a shortage of Fellows of the Australasian Faculty of Rehabilitation Medicine.

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer staging—staging basis of cancer, code A

METeOR identifier: 422604

Registration status: Health, Standard 07/12/2011

Definition: The timing and evidence for cancer stage values, as represented by a code.

Data Element Concept: Cancer staging—staging basis of cancer

Value domain attributes

Representational attributes

Representation class: Code

Data type: String

Format: A

Maximum character length: 1

Permissible values:

Value	Meaning
P	Pathological
C	Clinical

Collection and usage attributes

Guide for use: CODE P Pathological

Pathological stage is based on histological evidence acquired before treatment, supplemented or modified by additional evidence acquired from surgery and from pathological examination.

CODE C Clinical

Clinical stage is based on evidence obtained prior to treatment from physical examination, imaging, endoscopy, biopsy, surgical exploration or other relevant examinations.

Refer to the latest edition of the manual containing the appropriate classification system for the cancer. For example, refer to the latest edition of the International Union Against Cancer (UICC) reference manual TNM Classification of Malignant Tumours or the American Joint Committee on Cancer (AJCC) Cancer Staging Manual for coding rules for those tumours classified using the TNM system.

Data element attributes

Collection and usage attributes

Guide for use: It is recommended that the TNM Classification of Malignant Tumours (International Union Against Cancer (UICC)) or the American Joint Committee on Cancer (AJCC) Cancer Staging Manual be used whenever it is applicable. The classifications published in the AJCC Cancer Staging Manual are identical to the TNM classifications of the UICC.

TNM is not applicable to all tumour sites. Staging is of limited use in some cancers, for example, haematological malignancies. In these cases use the most appropriate classification system.

The Cancer Council Australia and Australian Cancer Network *Guidelines for the prevention, early detection and*

	management of colorectal cancer (2005, pp. 159-162) support the use of the Australian Clinico-Pathological Staging (ACPS) System. They recommend that both TNM and ACPS staging data be recorded to enable national and international comparisons. A table of correspondences between ACPS and TNM classifications is available. The current edition of each staging scheme should be used.
Comments:	Collected to identify which classification system is used to determine the extent of cancer at the time of diagnosis. Cancer stage is an important determinant of treatment and prognosis, and is used to evaluate new treatments and analyse outcomes. Survival analysis is adjusted by stage at diagnosis and distribution of cancer cases by type and stage.

Representation class: Code

Data type: Boolean

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use: Formal assessment against the relevant standards may occur via self-assessment or external assessment methods. A 'formal' self-assessment should involve a number of aspects, including the planning and development of a clear structure for the assessment process; the use of an accepted evaluation method such as a peer review; and the use of validated tools where these are available. A 'formal' assessment also includes a formal in-depth review against the relevant standards by an independent external reviewer. This may take place in the context of an accreditation process for the service provider organisation or the organisation of which the service provider organisation is a sub-unit.

CODE 1 Yes

The service provider organisation routinely undertakes or undergoes formal assessment against the specified healthcare standards.

CODE 2 No
The service provider organisation does not routinely undertake or undergo formal assessment against the specified healthcare standards.

Collection methods: Record only one code.

Statistical area level 2 (SA2)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Address—statistical area, level 2 (SA2) code (ASGS 2011) N(9)

Synonymous names: SA2

METeOR identifier: 457289

Registration status: Community Services, Standard 06/12/2011
Health, Standard 07/12/2011

Definition: A designated region describing location and contact details that represents a medium-sized area built from a number of Statistical Area 1, as represented by a code. The aim is to represent a community that interacts together socially and economically.

Data Element Concept: Address—statistical area

Value domain attributes

Representational attributes

Classification scheme: Australian Statistical Geography Standard 2011

Representation class: Code

Data type: String

Format: N(9)

Maximum character length: 9

Collection and usage attributes

Guide for use: SA2 coding structure:

An SA2 is identifiable by a 9-digit fully hierarchical code. The SA2 identifier is a 4-digit code, assigned in alphabetical order within an SA3. An SA2 code is only unique within a state/territory if it is preceded by the state/territory identifier.

For example:

State/territory	SA4	SA3	SA2
N	NN	NN	NNNN

Comments: There are 2,196 SA2 spatial units. In aggregate, they cover the whole of Australia without gaps or overlaps. Jervis Bay Territory, the Territory of the Cocos (Keeling) Islands and the Territory of Christmas Island are each represented by an SA2.

Statistical linkage key 581

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Record—linkage key, code 581 XXXXXDDMMYYYYN
METeOR identifier:	349895
Registration status:	Community Services, Standard 21/05/2010 Housing assistance, Standard 23/08/2010 Health, Standard 07/12/2011 Early Childhood, Standard 21/05/2010 Homelessness, Standard 23/08/2010
Definition:	A key that enables two or more records belonging to the same individual to be brought together. It is represented by a code consisting of the second, third and fifth characters of a person's family name, the second and third letters of the person's given name, the day, month and year when the person was born and the sex of the person, concatenated in that order.
Data Element Concept:	Record—linkage key

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	String
Format:	XXXXXDDMMYYYYN
Maximum character length:	14

Data element attributes

Collection and usage attributes

Collection methods:	Information about whether or not the person's date of birth is accurate should be noted. By knowing that date of birth is accurate it is possible to reduce underestimation of total service user numbers and overestimation of service users' ages.
Comments:	The linkage key is designed to make it possible to count number of clients and services they received, without counting the same client more than once. It can also be used for linking to other related data collections. It is for statistical linkage purposes only, not for case management or the tracking of individual persons. This may be done using a range of identifiers and/or keys.

Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Live birth
	2	Stillbirth (fetal death)
Supplementary values:	9	Not stated

Collection and usage attributes

Guide for use:

Live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of the pregnancy which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached; each product of such a birth is considered liveborn (WHO, 1992 definition).

Stillbirth is a fetal death prior to the complete expulsion or extraction from its mother of a product of conception of 20 or more completed weeks of gestation or of 400 g or more **birthweight**; the death is indicated by the fact that after such separation the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. (This is the same as the WHO definition of fetal death, except that there are no limits of gestational age or birthweight for the WHO definition.)

Value domain attributes

Representational attributes

Representation class: Text

Data type: String

Format: X[46]

Maximum character length: 46

Data element attributes

Collection and usage attributes

Guide for use: The suburb/town/locality name may be a town, city, suburb or commonly used location name such as a large agricultural property or Aboriginal community.

This metadata item may be used to describe the location of an organisation or person. It can be a component of a street or postal address.

If used for mailing purposes, the format of this data element should be upper case. Refer to Australia Post Address Presentation Standard. Any forced abbreviations shall be done by truncation from the right.

This data element is one of a number of items that can be used to create a primary address, as recommended by the AS 4590-2006 *Interchange of client information* standard. Components of the primary address are:

- Address site (or Primary complex) name
- Address number or number range
- Road name (name/type/suffix)

- Locality
- State/Territory
- Postcode (optional)
- Country (if applicable).

Comments: Official locality names and their associated boundary extents are assigned by relevant state naming committees/protocols. Their correct usage is encouraged.

Supported mental health housing places

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Specialised mental health service—supported mental health housing places, total NNNNNN

METeOR identifier: 390929

Registration status: Health, Standard 07/12/2011

Definition: The total number of housing places supported by specialised mental health services available at 30 June, targeted to people affected by mental illness or psychiatric disability.

Data Element Concept: Specialised mental health service—supported mental health housing places

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: NNNNNN

Maximum character length: 6

Source and reference attributes

Steward: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Guide for use: These are places made available by public housing authorities, health departments or non-government organisations (NGOs) under an agreement with the relevant State or Territory government authority responsible for funding mental health services. Such agreements commit the State or Territory funding authority to ensure provision of assistance to people within their homes through ongoing clinical and/or psychosocial rehabilitation support for their mental illness, including outreach services.

To be counted as a supported mental health housing place there must be a clear link between the housing place and the provision of clinical or psychosocial support by trained staff.

'Place' refers to number of supported places (beds) available for mental health consumers as at 30 June. It is not a count of consumers supported through the year nor a count of physical residences.

Excludes residential mental health services defined as specialised mental health services.

Surgery target site

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer treatment—surgery target site, topography code (ICD-O-3) ANN.N

METeOR identifier: 393415

Registration status: Health, Standard 07/12/2011

Definition: The target site of cancer-directed surgery performed during the initial course of treatment for cancer, as represented by an ICD-O-3 code.

Data Element Concept: Cancer treatment—surgery target site

Value domain attributes

Representational attributes

Classification scheme: International Classification of Diseases for Oncology 3rd edition

Representation class: Code

Data type: String

Format: ANN.N

Maximum character length: 5

Collection and usage attributes

Guide for use: Record all four alphanumeric characters of the topography code. The number after the decimal point represents the subsite or subcategory.

Data element attributes

Collection and usage attributes

Guide for use: The target site is collected for all cancer-directed surgery performed during the initial course of treatment. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

Cancer-directed surgery refers to all surgery that destroys or modifies cancer tissue anywhere in the body.

Cancer-directed surgery may be palliative, (to control symptoms, alleviate pain, or make the patient more comfortable), or curative.

Target sites for biopsies that remove the entire tumour and/or leave only microscopic margins are to be recorded here.

All sites or regions targeted for cancer-directed surgery during the initial course of treatment should be recorded. There may be more than one site targeted for treatment. For example, the primary tumour site and the site of a distant metastasis may receive cancer-directed surgery as part of the initial course of treatment.

The target site for radiotherapy is collected as a separate item.

Collection methods: This information should be obtained from the patient's medical record.

Comments: This is collected to identify which anatomical structures are targeted by surgery and is useful in evaluating patterns of care and patient outcomes.

Source and reference attributes

Submitting organisation: Cancer Australia

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer treatment—surgical procedure date, DDMMYYYY

METeOR identifier: 393424

Registration status: Health, Standard 07/12/2011

Definition: The date on which a cancer-directed surgical procedure was performed during the initial course of treatment for cancer, expressed as DDMMYYYY.

Data Element Concept: Cancer treatment—surgical procedure date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: The surgical procedure date is collected for all cancer-directed surgery delivered to the patient during initial treatment for cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease recurrence or progression.

Cancer-directed surgery refers to all surgery that destroys or modifies cancer tissue anywhere in the body.

Cancer-directed surgery may be palliative (to control symptoms, alleviate pain, or make the patient more comfortable), or curative.

The date of each surgical treatment episode should be entered separately.

Procedure dates for biopsies that remove all of the tumour and/or leave only microscopic margins are to be recorded here.

Dates for radiotherapy and systemic treatments are collected as separate items.

Collection methods: This information should be obtained from the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Systemic therapy agent or protocol

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Cancer treatment—systemic therapy agent or protocol, text X[(149)]
METeOR identifier:	393623
Registration status:	Health, Standard 07/12/2011
Definition:	The systemic therapy agent or protocol administered during the initial course of treatment for cancer, as represented by text.
Data Element Concept:	Cancer treatment—systemic therapy agent or protocol

Value domain attributes

Representational attributes

Representation class:	Text
Data type:	String
Format:	X[(149)]
Maximum character length:	150

Data element attributes

Collection and usage attributes

Guide for use:

Systemic therapy agents are drugs that travel through the bloodstream and reach and effect cells all over the body. They are administered orally or intravenously.

Each systemic therapy agent or protocol used during the initial treatment of the cancer should be recorded. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The name of each systemic therapy agent or protocol given as initial treatment is recorded regardless of whether the course of treatment is completed as intended, and regardless of the intent or timing of the treatment.

Oral systemic therapy agents normally given on an outpatient basis should also be included.

Systemic therapy agents may be administered as single-agent treatments or as a combination of drugs administered according to a prespecified regimen or protocol. A protocol is a precise and detailed plan for therapy that includes the type, quantity, method and length of time of taking the drugs required for any treatment cycle.

A combination of drugs may be known by acronyms but since details of drugs and acronyms may vary it is recommended that the name of each agent be recorded.

When recording systemic therapy protocol names, eviQ should be used wherever possible. eviQ Cancer Treatments Online is a point of care clinical information resource that provides health professionals with current evidence based, peer maintained, best practice cancer treatment protocols and information. It was developed and is maintained by the Cancer Institute NSW.

If a single agent is being used or a protocol is not included in eviQ, then the full, generic name of any agent should be recorded preferably using the Australian Medicines Terminology (AMT), or if necessary, the Australian Medicines Handbook (AMH) or MIMS. If a generic name is not available because the drug is experimental or under patent protection, record the brand name.

The eviQ protocol identifier number should be recorded separately in the data element *Cancer treatment—systemic therapy agent(s) or protocol, eviQ protocol identifier, NNNNNN*.

Systemic therapy agents are encompassed in the treatment modalities **chemotherapy**, **immunotherapy** and **hormone therapy** administered for the treatment of cancer.

A patient may receive treatment with a protocol that includes different types of systemic therapy agents, for example, a chemotherapy agent and an immunotherapy agent.

Targeted therapies (treatments that use drugs or other substances to identify and attack specific cancer cells) using a chemotherapy agent are included. Other targeted therapies, such as monoclonal antibody therapy, are recorded in the data element *Cancer treatment—other cancer treatment, text [X(150)]*.

Do not code prednisone as hormone therapy when it is administered for reasons other than chemotherapeutic treatment. Only record prednisone as hormone therapy when administered in combination with chemotherapy such as MOPP (mechlorethamine, vincristine, procarbazine, prednisone) or COPP (cyclophosphamide, vincristine, procarbazine, prednisone).

Tumour involvement or cancer treatment may destroy hormone-producing tissue. Hormone replacement therapy will be given if the hormone is necessary to maintain normal metabolism and body function. Do not code hormone replacement therapy as part of the initial course of treatment.

Collection methods: This information should be collected from the patient's medical record.

Comments: Note the distinction between the administration of systemic agents or drugs and systemic therapy procedures that affect the hormonal or immunologic balance of the patient.

The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome.

	99	Systemic therapy procedures were administered but were not stated/inadequately described

Collection and usage attributes

Guide for use: Systemic therapy procedures are medical, surgical or radiation procedures that have an effect on the hormonal or immunological balance of the patient, and refers to haematologic transplant and endocrine procedures.

Source and reference attributes

Submitting organisation: Cancer Australia.

Reference documents: American College of Surgeons 2002. Facility Oncology Registry Data Standards (FORDS), 2009 revision. Commission on Cancer, 28D-28E, 182-183.

Data element attributes

Collection and usage attributes

Guide for use: Systemic therapy procedures refers to haematologic transplant and endocrine procedures. Haematologic transplants are bone marrow or stem cell transplants performed to protect patients from myelosuppression or bone marrow ablation associated with the administration of high-dose chemotherapy or radiotherapy.

Endocrine therapy is cancer therapy that achieves its antitumour effect through the use of radiation or surgical procedures that suppress the naturally occurring hormonal activity of the patient (when the cancer occurs at another site) and, therefore, alter or affect the long-term control of the cancer's growth.

Haematologic transplant or endocrine procedures may be provided to prolong a patient's life by controlling symptoms, to alleviate pain, or make the patient more comfortable.

Each systemic therapy procedure delivered to the patient during the initial treatment for cancer should be recorded. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease recurrence or progression.

The procedure code for each treatment episode should be entered separately.

Bone marrow transplants should be coded as either autologous (bone marrow originally taken from the patient) or allogeneic (bone marrow donated by a person other than the patient). For cases in which the marrow transplant was syngeneic (transplanted marrow from an identical twin), the item is coded as allogeneic.

Stem cell harvests involve the collection of immature blood cells from the patient and the reintroduction by transfusion of the harvested cells following chemotherapy or radiation therapy.

Endocrine procedures must be bilateral to qualify as endocrine surgery or endocrine radiation. If only one gland is intact at the start of treatment, surgery and/or radiation to that remaining gland qualifies as endocrine surgery or endocrine radiation.

Collection methods: This information should be obtained from the patient's medical record.

Comments: The collection of specific treatment information is useful to evaluate patterns of care, the effectiveness of different treatment modalities, and treatment by patient outcome.

Note the distinction between the administration of systemic agents or drugs and systemic therapy procedures that affect the hormonal or immunologic balance of the patient.

Systemic therapy procedure date

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Cancer treatment—systemic therapy procedure date, DDMMYYYY

Synonymous names: Haematologic transplant, endocrine procedures

METeOR identifier: 394581

Registration status: Health, Standard 07/12/2011

Definition: The date on which a **systemic therapy procedure** was administered during the initial course of treatment for cancer, expressed as DDMMYYYY.

Data Element Concept: Cancer treatment—systemic therapy procedure date

Value domain attributes

Representational attributes

Representation class: Date

Data type: Date/Time

Format: DDMMYYYY

Maximum character length: 8

Data element attributes

Collection and usage attributes

Guide for use: The date is collected for all systemic therapy procedures administered to the patient during the initial treatment for cancer. The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease recurrence or progression.

A systemic therapy procedure is a medical, surgical or radiation procedure that has an effect on the hormonal or immunologic balance of the patient, and refers to haematologic transplant and endocrine procedures. Haematologic transplants are bone marrow or stem cell transplants performed to protect patients from myelosuppression or bone marrow ablation associated with the administration of high-dose chemotherapy or radiotherapy.

Endocrine therapy is cancer therapy that achieves its antitumour effect through the use of radiation or surgical procedures that suppress the naturally occurring hormonal activity of the patient (when the cancer occurs at another site) and, therefore, alter or affect the long-term control of the cancer's growth.

Haematologic transplant or endocrine procedures may be provided to prolong a patient's life by controlling symptoms, to alleviate pain, or make the patient more comfortable.

The date of each treatment episode should be entered separately.

The date of cancer-directed surgery, radiotherapy and treatment with systemic agents are collected as separate items.

Collection methods: This information should be obtained from the patient's medical record.

Comments: Collecting the start and finish dates for treatment modalities will enable an estimate of treatment duration.

Note the distinction between the administration of systemic agents or drugs and systemic therapy procedures that affect the hormonal or immunologic balance of the patient.

Teaching status

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Establishment—teaching status (university affiliation), code N
METeOR identifier:	270148
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator to identify the non-direct patient care activity of teaching for a particular establishment, as represented by a code.
Data Element Concept:	Establishment—teaching status (university affiliation)

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Yes
	2	No
Supplementary values:	9	Unknown

Data element attributes

Collection and usage attributes

Guide for use:

In this context, teaching relates to teaching hospitals affiliated with universities providing undergraduate medical education as advised by the relevant state health authority.

Comments:

The initial intention based on the Taskforce on National Hospital Statistics approach had been to have non-direct care activity indicators for all of the following non-direct patient care activities:

- teaching
- research
- group or community contacts
- public health activities
- mobile centre and/or part-time service.

However, the Resources Working Party decided to delete 2, 3, 4 and 5 and place the emphasis on teaching where teaching (associated with a university) was a major program activity of the hospital. The working party took the view that it was extremely difficult to identify research activities in health institutions because many staff consider that they do research as part of their usual duties. The research indicator was thus deleted and the teaching indicator was agreed to relate to teaching hospitals affiliated with universities providing undergraduate medical education, as advised by the relevant state health authority. If a teaching hospital is identified by a Yes/no indicator then it is not necessary to worry about research (based on the assumption that if you have teaching, you have research).

CODE 1 Yes

A person has received a Team Care Arrangement.

CODE 2 No

A person has not received a Team Care Arrangement.

Comments:

The Chronic Disease Management Medicare items on the Medicare Benefits Schedule (MBS) enable GPs to plan and coordinate the health care of patients with chronic or terminal medical conditions, including patients with these conditions who require multidisciplinary, team-based care from a GP and at least two other health or care providers. The items are designed for patients who require a structured approach to their care. A ‘chronic medical condition’ is one that has been or is likely to be present for at least six months, including but not limited to asthma, cancer, cardiovascular disease, diabetes mellitus and musculoskeletal conditions (Department of Health and Ageing 2011a).

Team Care Arrangements (TCAs) are required by legislation to include a document that describes:

- treatment and service goals for the patient
- treatment and services that collaborating providers will provide to the patient
- actions to be taken by the patient
- a date to review these matters (Department of Health and Ageing 2011b).

This chronic disease management service is for a patient who:

(a) has at least one medical condition that:

i. has been (or is likely to be) present for at least six months; or

ii. is terminal; and

(b) requires ongoing care from at least three collaborating health or care providers, each of whom provides a different kind of treatment or service to the patient, and at least one of whom is a medical practitioner (Department of Health and Ageing 2011c).

Representational attributes

Representation class: Text

Data type: String

Format: [X(40)]

Maximum character length: 40

Data element attributes

Collection and usage attributes

Guide for use: More than one phone number may be recorded as required. Each phone number should have an appropriate telephone number type code assigned. Record the full phone number (including any prefixes) with no punctuation (hyphens or brackets).

Collection methods: Prefix plus telephone number:

Record the prefix plus telephone number. The default should be the local prefix with an ability to overtype with a different prefix.

For example, 08 8226 6000 or 0417 123456.

Punctuation:

Do not record punctuation.

For example, (08) 8226 6000 or 08-8226 6000 would not be correct.

Unknown:

Leave the field blank.

Comments: Concerned with the use of person identification data. For organisations that create, use or maintain records on people. Organisations should use this standard, where appropriate, for collecting data when registering people. The positive and unique identification of people is a critical event in service delivery, with direct implications for the safety and quality of care delivered by health and community services.

Source and reference attributes

Reference documents:	ISO 8601:2000 : Data elements and interchange formats - Information interchange - Representation of dates and times

Data element attributes

Collection and usage attributes

Guide for use:

Acute coronary syndrome symptoms may include:

- tightness, pressure, heaviness, fullness or squeezing in the chest which may spread to the neck and throat, jaw, shoulders, the back, upper abdomen, either or both arms and even into the wrists and hands
- dyspnoea, nausea/vomiting, cold sweat or syncope.

Seeking medical attention could include the person presenting to their GP who then refers them to hospital or the person presenting directly to hospital (via ambulance or own form of transport).

If the person is already a patient at the hospital for another reason then the time recorded would be when they advised hospital staff of their symptoms.

Collection methods: Record the time of onset of the most significant acute coronary syndrome symptom/s that prompted the person to seek medical attention (from the person's perspective).

Reference documents: ISO 8601:2000 : Data elements and interchange formats - Information interchange - Representation of dates and times

Data element attributes

Collection and usage attributes

Guide for use: For community health care, outreach services and services provided via telephone or telehealth, this may be the time at which the service provider presents to the patient or the telephone/telehealth session commences.

The time of patient presentation at the **emergency department** is the earliest occasion of being registered clerically or triaged.

The time that the patient presents is not necessarily:

- the listing time for care (see listing date for care for an analogous concept), nor
- the time at which care is scheduled to be provided, nor
- the time at which commencement of care actually occurs (for admitted patients see admission time, for hospital non-admitted patient care and community health care see service commencement time).

Conditional obligation:
If prescribed, provide a phase for each time angiotensin II receptor blocker therapy is prescribed.

Timing of antithrombin therapy prescription

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—timing of antithrombin therapy prescription, code N
METeOR identifier:	350510
Registration status:	Health, Standard 01/10/2008
Definition:	The timing of care when antithrombin therapy is prescribed to a person, as represented by a code.
Data Element Concept:	Person—timing of antithrombin therapy prescription

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Initial medical management: preceding reperfusion therapy
	2	During reperfusion therapy
	3	Following reperfusion therapy
Supplementary values:	9	Not stated/inadequately described

Source and reference attributes

Reference documents: National Heart Foundation of Australia and Cardiac Society of Australia and New Zealand, Guidelines for the management of acute coronary syndromes 2006, Med J Aust; 184; S1-S32. © MJA2006.

Data element attributes

Collection and usage attributes

Guide for use: Reperfusion therapy includes percutaneous coronary intervention and fibrinolytic therapy.

CODE 1 Initial medical management: preceding reperfusion therapy

Use this code when antithrombin therapy is prescribed before reperfusion therapy is to be performed.

CODE 2 During reperfusion therapy

Use this code when antithrombin therapy is prescribed while reperfusion therapy is being performed.

CODE 3 Following reperfusion therapy

Use this code when antithrombin therapy is prescribed after reperfusion therapy has been performed.

Collection methods: Record for each time antithrombin therapy is prescribed for the person.

Relational attributes

Implementation in Data Set Specifications: Acute coronary syndrome pharmacotherapy data cluster Health, Standard 01/10/2008

Conditional obligation:

If prescribed, provide a phase for each time antithrombin therapy is prescribed

Timing of aspirin prescription

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—timing of aspirin prescription, code N
METeOR identifier:	347829
Registration status:	Health, Standard 01/10/2008
Definition:	The timing of care when aspirin is prescribed to a person, as represented by a code.
Data Element Concept:	Person—timing of aspirin prescription

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Prior to presentation at hospital

Use this code when the person has been previously prescribed clopidogrel prior to presentation at the hospital and the person is still following the prescription.

CODE 2 First 24 hours of presentation

Use this code when clopidogrel is prescribed within the first 24 hours following presentation to the hospital.

CODE 3 After 24 hours and before discharge

Use this code when clopidogrel is prescribed following the first 24 hours after presentation to the hospital and before discharge from the hospital.

CODE 4 At discharge

Use this code when clopidogrel is prescribed at discharge from the hospital.

Collection methods: Record each time clopidogrel is prescribed for the person.

Relational attributes

Implementation in Data Set Specifications: Acute coronary syndrome pharmacotherapy data cluster Health, Standard 01/10/2008

Conditional obligation:
If prescribed, provide a phase for each time clopidogrel therapy is prescribed.

Timing of glycoprotein IIb/IIIa inhibitor prescription

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—timing of glycoprotein IIb/IIIa inhibitor prescription, code N
METeOR identifier:	349367
Registration status:	Health, Standard 01/10/2008
Definition:	The timing of care when a glycoprotein IIb/IIIa inhibitor is prescribed to a person, as represented by a code.
Data Element Concept:	Person—timing of glycoprotein IIb/IIIa inhibitor prescription

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Initial medical management: preceding invasive management
	2	During invasive management
	3	Following invasive management
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

Invasive management includes angiography, percutaneous coronary intervention and coronary artery bypass graft.

CODE 1 Initial medical management: preceding invasive management

Use this code when a glycoprotein IIb/IIIa inhibitor is prescribed before invasive management is to be performed.

CODE 2 During invasive management

Use this code when a glycoprotein IIb/IIIa inhibitor is prescribed while invasive management is being performed.

CODE 3 Following invasive management

Use this code when a glycoprotein IIb/IIIa inhibitor is prescribed after invasive management has been performed.

Collection methods:	Record each time a glycoprotein IIb/IIIa inhibitor is prescribed for a person.

Relational attributes

Implementation in Data Set Specifications:	Acute coronary syndrome pharmacotherapy data cluster Health, Standard 01/10/2008 *Conditional obligation:* If prescribed, provide a phase for each time glycoprotein IIb/IIIa inhibitor therapy is prescribed.

Timing of statin prescription

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—timing of statin prescription, code N
METeOR identifier:	350445
Registration status:	Health, Standard 01/10/2008
Definition:	The timing of care when a statin is prescribed to a person, as represented by a code.
Data Element Concept:	Person—timing of statin prescription

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	1	Prior to presentation at hospital
	2	First 24 hours of presentation

Conditional on the person indicating that they currently smoke.

Tobacco smoking indicator, after 20 weeks of pregnancy

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Female (pregnant)—tobacco smoking indicator (after twenty weeks of pregnancy), yes/no code N
METeOR identifier:	365417
Registration status:	Health, Standard 03/12/2008
Definition:	A self-reported indicator of whether a pregnant woman smoked tobacco at any time after the first 20 weeks of her pregnancy until the birth, as represented by a code
Context:	Perinatal Statistics
Data Element Concept:	Female (pregnant)—tobacco smoking indicator (after twenty weeks of pregnancy)

Value domain attributes

Representational attributes

Representation class:	Code	
Data type:	Number	
Format:	N	
Maximum character length:	1	
Permissible values:	Value	Meaning
	1	Yes
	2	No
Supplementary values:	9	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 9 Not stated/ inadequately described

This code is not for use in primary data collections.

Data element attributes

Collection and usage attributes

Guide for use:

CODE 1 Yes

Record if a woman smoked tobacco at any time after the first 20 weeks of pregnancy.

CODE 2 No

Record if a woman did not smoke tobacco at any time after the first 20 weeks of pregnancy.

Collection methods: Recommended question: 'Did the woman smoke at all after 20 weeks of pregnancy?', where after 20 weeks of pregnancy is defined as greater than or equal to 20 weeks + 0 days.

To ensure consistency of results, data should be collected after delivery.

Registration status:	Health, Standard 01/03/2005
Definition:	A person's current and past smoking behaviour, as represented by a code.
Context:	Public health and health care
Data Element Concept:	Person—tobacco smoking status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Daily smoker
2	Weekly smoker
3	Irregular smoker
4	Ex-smoker
5	Never smoked

Collection and usage attributes

Guide for use:

CODE 1 Daily smoker

A person who smokes daily

CODE 2 Weekly smoker

A person who smokes at least weekly but not daily

CODE 3 Irregular smoker

A person who smokes less than weekly

CODE 4 Ex-smoker

A person who does not smoke at all now, but has smoked at least 100 cigarettes or a similar amount of other tobacco products in his/her lifetime.

CODE 5 Never-smoker

A person who does not smoke now and has smoked fewer than 100 cigarettes or similar amount of other tobacco products in his/her lifetime.

Source and reference attributes

Reference documents: Standard Questions on the Use of Tobacco Among Adults (1998)

Data element attributes

Collection and usage attributes

Collection methods: The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults - interviewer administered (Questions 1 and 4) and self-administered (Questions 1 and 1a) versions. The questionnaires are designed to cover persons aged 18 years and over.

Comments: There are two other ways of categorising this information:

- Regular and irregular smokers where a regular smoker includes someone who is a daily smoker or a weekly smoker. 'Regular' smoker is the preferred category to be reported in prevalence estimates.
- Daily and occasional smokers where an occasional smoker includes someone who is a weekly or irregular smoker. The category of 'occasional' smoker can be used when the aim of the study is to draw contrast between daily smokers and other smokers.

  Where this information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

Smoker type is used to define subpopulations of adults (age 18+ years) based on their smoking behaviour.

Smoking has long been known as a health risk factor. Population studies indicate a relationship between smoking and increased mortality/morbidity.

This data element can be used to estimate smoking prevalence. Other uses are:

- To evaluate health promotion and disease prevention programs (assessment of interventions)
- To monitor health risk factors and progress towards National Health Goals and Targets

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Tobacco smoking—consumption/quantity (cigarettes)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—number of cigarettes smoked (per day), total N[N]
METeOR identifier:	270332
Registration status:	Health, Standard 01/03/2005
Definition:	The total number of cigarettes (manufactured or roll-your-own) smoked per day by a person.
Context:	Public health and health care
Data Element Concept:	Person—number of cigarettes smoked

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[N]
Maximum character length:	2

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use:

This metadata item is relevant only for persons who currently smoke cigarettes daily or at least weekly. Daily consumption should be reported, rather than weekly consumption. Weekly consumption is converted to daily consumption by dividing by 7 and rounding to the nearest whole number.

Quantities greater than 98 (extremely rare) should be recorded as 98.

Collection methods:

The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Questions 3a and 3b) and self-administered (Questions 2a and 2b) versions.

The questions cover persons aged 18 and over.

Comments:

The number of cigarettes smoked is an important measure of the magnitude of the tobacco problem for an individual.

Research shows that of Australians who smoke, the overwhelming majority smoke cigarettes (manufactured or roll-your-own) rather than other tobacco products.

From a public health point of view, consumption level is relevant only for regular smokers (those who smoke daily or at least weekly).

Data on quantity smoked can be used to:

- evaluate health promotion and disease prevention programs
(assessment of interventions)
- monitor health risk factors and progress towards National Health
Goals and Targets
- ascertain determinants and consequences of smoking
- assess a person’s exposure to tobacco smoke.

Where this information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Relational attributes

Tobacco smoking—duration (daily smoking)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—tobacco smoking duration (daily smoking), total years N[N]

METeOR identifier: 270330

Registration status: Health, Standard 01/03/2005

Definition: The total duration in years, of daily smoking for a person who is now a daily smoker or has been a daily smoker in the past.

Context: Public health and health care

Data Element Concept: Person—tobacco smoking duration

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N]

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Unit of measure: Year

Data element attributes

Collection and usage attributes

Guide for use: In order to estimate duration of smoking the person's date of birth or current age should also be collected. If a person reports that they smoke daily now then duration is the difference between the start-age and the person's current age. If a person reports that they smoked daily in the past but do not smoke daily now then duration is the difference between the quit age and the start age. Record duration of less than one year as 0.

Collection methods: The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Question 1, 5, 6, 7) and self-administered (Question 1, 3, 3a, 4) versions. The questions cover persons aged 18 years and over.

Comments: Duration of daily smoking is an indicator of exposure to increased risk to health. In this data element, duration is measured as the years elapsed from the time the person first started smoking daily and when they most recently quit smoking daily (or the present for those persons who still smoke daily). There may have been intervening periods when the person did not smoke daily. However, as the negative health effects of smoking accumulate over time, the information on duration of daily smoking, as measured in this data element, remains useful, despite any intervening periods of non-daily smoking.

Where this information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Tobacco smoking—ever daily use

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—tobacco smoking daily use status, code N
METeOR identifier:	270329
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of whether a person has ever smoked tobacco in any form on a daily basis in their lifetime, as represented by a code.
Data Element Concept:	Person—tobacco smoking daily use status

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Ever-daily
2	Never-daily

Collection and usage attributes

Guide for use:

CODE 1 Ever-daily

If a person reports that they now smoke cigarettes, cigars, pipes or any other tobacco products daily OR if they report that in the past they have been a daily smoker, they are coded to 1 (ever-daily).

CODE 2 Never-daily

If a person reports that they have never smoked cigarettes, cigars, pipes or any other tobacco products daily AND they have never in the past been a daily smoker then they are coded to 2 (never-daily).

Data element attributes

Collection and usage attributes

Collection methods:

The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Question 1 and 5) and self-administered (Question 1 and 3) versions. The questions cover persons aged 18 years and over.

Comments:

Whether a person has ever smoked on a daily basis can be used to assess an individual's health risk from smoking and to monitor population trends in smoking behaviour.

It can also be used to:

- evaluate health promotion and disease prevention programs (assessment of interventions);
- monitor health risk factors;
- ascertain determinants and consequences of smoking.

Where the information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Tobacco smoking—frequency

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—tobacco smoking frequency, code N
METeOR identifier:	270328
Registration status:	Health, Standard 01/03/2005
Definition:	How often a person now smokes a tobacco product, as represented by a code.
Data Element Concept:	Person—tobacco smoking frequency

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Smokes daily
2	Smokes at least weekly, but not daily
3	Smokes less often than weekly
4	Does not smoke at all

Data element attributes

Collection and usage attributes

Guide for use: To record multiple use data, repeat the data field as many times as necessary, viz: product1, product2 etc. In most instances, data on both product and frequency are needed. In such situations, repeat both fields as many times as necessary, viz: product1, frequency1, product2, frequency2 etc.

Collection methods: The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Question 1) and self-administered (Question 1) versions. The questions relate to smoking of manufactured cigarettes, roll-your-own cigarettes, cigars, pipes and other tobacco products and are designed to cover persons aged 18 years and over.

Comments: The frequency of smoking helps to assess a person's exposure to tobacco smoke which is a known risk factor for cardiovascular disease and cancer. From a public health point of view, the level of consumption of tobacco as measured by frequency of smoking tobacco products is only relevant for regular smokers (persons who smoke daily or at least weekly).

Where this information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Technical name:	Person—tobacco product smoked, code N
METeOR identifier:	270327
Registration status:	Health, Standard 01/03/2005
Definition:	The type of tobacco product smoked by a person, as represented by a code.
Data Element Concept:	Person—tobacco product smoked

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Cigarettes - manufactured
2	Cigarettes - roll-your-own
3	Cigars
4	Pipes
5	Other tobacco product
6	None

Data element attributes

Collection and usage attributes

Guide for use: To record multiple use data, repeat the data field as many times as necessary, viz: product1, product2 etc. In most instances, data on both product and frequency are needed. In such situations, repeat both fields as many times as necessary, viz: product1, frequency1, product2, frequency2 etc.

Collection methods: The recommended standard for collecting information about smoking the above tobacco products is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer or self-administered versions.

Comments: Tobacco smoking is a known risk factor for cardiovascular disease and cancer. The type of tobacco product smoked by a person in conjunction with information about the frequency of smoking assists with establishing a profile of smoking behaviour at the individual or population level and with monitoring shifts from cigarette smoking to other types of tobacco products and vice versa.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Tobacco smoking—quit age (daily smoking)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—tobacco smoking quit age (daily smoking), total years NN

METeOR identifier: 270323

Registration status: Health, Standard 01/03/2005

Definition: The age in years at which a person who has smoked daily in the past and is no longer a daily smoker most recently stopped smoking daily.

Context: Public health and health care

Data Element Concept: Person—tobacco smoking quit age

Value domain attributes

Representational attributes

Representation class: Total

Data type: String

Format: NN

Maximum character length: 2

Supplementary values:

Value	Meaning
99	Not stated/inadequately described

Unit of measure: Year

Data element attributes

Collection and usage attributes

Guide for use: In order to estimate quit-age, the person's date of birth or current age should also be collected. Quit-age may be directly reported, or derived from the date the person quit smoking or the length of time since quitting, once the person's date of birth (or current age) is known.

Quit-age is relevant only to persons who have been daily smokers in the past and are not current daily smokers.

Collection methods: The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults - interviewer administered (Question 6) and self-administered (Question 3a) versions. The questions cover persons aged 18 years and over.

The relevant question in each version of the questionnaires refers to when the person finally stopped smoking daily, whereas the definition for this metadata item refers to when the person most recently stopped smoking daily. However, in order to provide information on when the person most recently stopped smoking daily, the most appropriate question to ask at the time of collecting the information is when the person finally stopped smoking daily.

Comments:

Quit-age and start-age provide information on the duration of daily smoking and exposure to increased risk to health.

Where the information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Data element attributes

Collection and usage attributes

Guide for use:

Record age in completed years.

This information is relevant only if a person currently smokes daily or has smoked daily in the past.

Collection methods:

The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Question 7) and self-administered (Question 4) versions. The questions cover persons aged 18 years and over.

Comments:

Start-age may be used to derive duration of smoking, which is a much stronger predictor of the risks associated with smoking than is the total amount of tobacco smoked over time.

Where the information is collected by survey and the sample permits, population estimates should be presented by sex and age groups. The recommended age groups are:

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

90	10 months
91	11 months
92	months, not specified

	93	years, not specified
Supplementary values:	99	not stated

Data element attributes

Collection and usage attributes

Guide for use:

In order to estimate time since quitting for all respondents, the person’s date of birth or current age should also be collected.

For optimal flexibility of use, the time since quitting is coded as months or years. However, people may report the time that they quit smoking in various ways (e.g. age, a date, or a number of days or weeks ago). When the information is reported in weeks and is less than 4, or in days and is less than 28, then code 80.

When the person reports the time since quitting as weeks ago, convert into months by dividing by 4 (rounded down to the nearest month).

If days reported are between 28 and 59, then code 81.

Where the information is about age only, time since quitting (daily use) is the difference between quit-age and age at survey.

Collection methods:

The recommended standard for collecting this information is the Standard Questions on the Use of Tobacco Among Adults (1998) - interviewer administered (Question 6) and self-administered (Question 3) versions.

Comments:

Time since quitting daily smoking may give an indication of improvement in the health risk profile of a person. It is also useful in evaluating health promotion campaigns.

Where this information is collected by survey and the sample permits, population estimates should be presented by sex and 5-year age groups. Summary statistics may need to be adjusted for age and other relevant variables.

It is recommended that in surveys of smoking, data on age, sex and other socio-demographic variables should be collected. It is also recommended that when smoking is investigated in relation to health, data on other risk factors including pregnancy status, physical activity, overweight and obesity, and alcohol consumption should be collected.

Total contract patient days

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Admitted patient hospital stay—number of patient days (of contracted care), total N[NN]
METeOR identifier:	270301
Registration status:	Health, Standard 01/03/2005
Definition:	Sum of the number of contract patient days for all periods within the hospital stay.
Data Element Concept:	Admitted patient hospital stay—number of patient days (of contracted care)

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NN]
Maximum character length:	3
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

Count number of days.

A day is measured from midnight to 2359 hours.

Contract patient days are included in the total count of patient days. If necessary, contract patient days can be distinguished from other patient days by using the following rules:

- The day the contract commences is counted as a contract patient day.
- If the patient is on contract from midnight to 2359 count as a contract patient day.
- The day a contract is completed is not counted as a contract patient day.
- If the patient is admitted and commences a contract on the same day, this is not counted as a contract patient day.
- If a contract is completed and the patient is separated on the same day, the day should not be counted as a

contract or other patient day.

Relational attributes

Total leave days

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of admitted patient care—number of leave days, total N[NN]

METeOR identifier: 270251

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: Sum of the length of leave (date returned from leave minus date went on leave) for all periods within the hospital stay.

Data Element Concept: Episode of admitted patient care—number of leave days

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NN]

Maximum character length: 3

Unit of measure: Day

Data element attributes

Collection and usage attributes

Guide for use: A day is measured from midnight to midnight.

The following rules apply in the calculation of leave days for both overnight and **same-day patients**:

- The day the patient goes on leave is counted as a leave day.
- The day the patient is on leave is counted as a leave day.
- The day the patient returns from leave is counted as a patient day.
- If the patient is admitted and goes on leave on the same day, this is counted as a patient day, not a leave day.
- If the patient returns from leave and then goes on leave again on the same day, this is counted as a leave day.
- If the patient returns from leave and is separated on the same day, the day should not be counted as either a patient day or a leave day.

Comments: It should be noted that for private patients in public and private hospitals, s.3 (12) of the Health Insurance Act 1973 (Cwlth) currently applies a different leave day count, Commonwealth Department of Human Services and Health HBF Circular 354 (31 March 1994). This metadata item was modified in July 1996 to exclude the previous differentiation between the psychiatric and other patients.

Total psychiatric care days

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Episode of care—number of psychiatric care days, total N[NNNN]

METeOR identifier: 270300

Registration status: Health, Standard 01/03/2005

Definition: The sum of the number of days or part days of stay that the person received care as an admitted patient or **resident** within a designated psychiatric unit, minus the sum of leave days occurring during the stay within the designated unit.

Data Element Concept: Episode of care—number of psychiatric care days

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[NNNN]

Maximum character length: 5

Unit of measure: Day

Data element attributes

Collection and usage attributes

Guide for use: Designated psychiatric units are staffed by health professionals with specialist mental health qualifications or training and have as their principal function the treatment and care of patients affected by mental disorder. The unit may or may not be recognised under relevant State and Territory legislation to treat patients on an involuntary basis. Patients are admitted patients in the acute and psychiatric hospitals and residents in community based residences.

Public acute care hospitals:

Designated psychiatric units in public acute care hospitals are normally recognised by the State/Territory health authority in the funding arrangements applying to those hospitals.

Private acute care hospitals:

Designated psychiatric units in private acute care hospitals normally require license or approval by the State/Territory health authority in order to receive benefits from health funds for the provision of psychiatric care.

Psychiatric hospitals:

Total psychiatric care days in stand-alone psychiatric hospitals are calculated by counting those days the patient received specialist psychiatric care. Leave days and days on which the patient was receiving other care (e.g. specialised intellectual ability or drug and alcohol care) should be excluded.

Psychiatric hospitals are establishments devoted primarily to the treatment and care of admitted patients with psychiatric, mental or behavioural disorders. Private hospitals formerly approved by the Commonwealth Department of Health under the Health Insurance Act 1973 (Commonwealth) (now licensed/approved by each State/Territory health authority), catering primarily for patients with psychiatric or behavioural disorders are included in this category.

Community-based residential services:

Designated psychiatric units refers to 24-hour staffed community-based residential units established in community settings that provide specialised treatment, rehabilitation or care for people affected by a mental illness or psychiatric disability. Special psychiatric units for the elderly are covered by this category, including psychogeriatric hostels or psychogeriatric nursing homes. Note that residences occupied by admitted patients located on hospital grounds, whether on the campus of a general or stand-alone psychiatric hospital, should be counted in the category of admitted patient services and not as community-based residential services.

Counting of patient days and leave days in designated psychiatric units should follow the standard definitions applying to these items.

For each period of care in a designated psychiatric unit, total days is calculated by subtracting the date on which care commenced within the unit from the date on which the specialist unit care was completed, less any leave days that occurred during the period.

Total psychiatric care days in 24-hour community-based residential care are calculated by counting those days the patient received specialist psychiatric care. Leave days and days on which the patient was receiving other care (e.g. specialised intellectual ability or drug and alcohol care) should be excluded.

Admitted patients in acute care:

Commencement of care within a designated psychiatric unit may be the same as the date the patient was admitted to the hospital, or occur subsequently, following transfer of the patient from another hospital ward. Where commencement of psychiatric care occurs by transfer from another ward, a new episode of care may be recorded, depending on whether the care type has changed (see metadata item Care type). Completion of care within a designated psychiatric unit may be the same as the date the patient was discharged from the hospital, or occur prior to this on transfer of the patient to another hospital ward. Where completion of psychiatric care is followed by transfer to another hospital ward, a new episode of care may be recorded, depending on whether the care type has changed (see metadata item Care type. Total psychiatric care days may cover one or more periods in a designated psychiatric unit within the overall hospital stay.

Collection methods: Accurate counting of total days in psychiatric care requires periods in designated psychiatric units to be identified in the person-level data collected by state or territory health authorities. Several mechanisms exist for this data field to be implemented:

- Ideally, the new data field should be collected locally by hospitals and added to the unit record data provided to the relevant state/territory health authority.
- Acute care hospitals in most states and territories include details of the wards in which the patient was accommodated in the unit record data provided to the health authority. Local knowledge should be used to identify designated psychiatric units within each hospital's ward codes, to allow total psychiatric care days to be calculated for each episode of care.
- Acute care hospitals and 24-hour staffed community-based residential services should be identified separately at the level of the establishment.

Comments: This metadata item was originally designed to monitor trends in the delivery of psychiatric admitted patient care in acute care hospitals. It has been modified to enable collection of data in the community-based residential care sector. The metadata item is intended to improve understanding in this area and contribute to the ongoing evaluation of changes occurring in mental health services.

Permissible values:

Value	Meaning
1	Non-residential treatment facility
2	Residential treatment facility
3	Home
4	Outreach setting
8	Other

Collection and usage attributes

Guide for use:

Only one code to be selected at the end of the alcohol and other drug treatment episode. Agencies should report the setting in which most of the main type of treatment was received by the client during the treatment episode.

CODE 1 Non-residential treatment facility

This code refers to any non-residential centre that provides alcohol and other drug treatment services, including hospital outpatient services and community health centres.

CODE 2 Residential treatment facility

This code refers to community-based settings in which clients reside either temporarily or long-term in a facility that is not their home or usual place of residence to receive alcohol and other drug treatment. This does not include ambulatory situations, but does include therapeutic community settings.

CODE 3 Home

This code refers to the client's own home or usual place of residence.

CODE 4 Outreach setting

This code refers to an outreach environment, excluding a client's home or usual place of residence, where treatment is provided. An outreach environment may be any public or private location that is not covered by Codes 1-3. Mobile/outreach alcohol and other drug treatment service providers would usually provide treatment within this setting.

Triage category

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Non-admitted patient emergency department service episode—triage category, code N

METeOR identifier: 474185

Registration status: Health, Standard 30/01/2012

Definition: The urgency of the patient's need for medical and nursing care as assessed at **triage**, as represented by a code.

Context: Emergency department care.

Data Element Concept: Non-admitted patient emergency department service episode—triage category

Value domain attributes

Representational attributes

Representation class: Code

Data type: Number

Format: N

Maximum character length: 1

Permissible values:

Value	Meaning
1	Resuscitation: immediate (within seconds)
2	Emergency: within 10 minutes
3	Urgent: within 30 minutes
4	Semi-urgent: within 60 minutes
5	Non-urgent: within 120 minutes

Data element attributes

Collection and usage attributes

Collection methods: This triage classification is to be used in the emergency departments of hospitals. Patients will be triaged into one of five categories on the National Triage Scale according to the triageur's response to the question: 'This patient should wait for medical care no longer than ...?'.

The triage category is allocated by an experienced **registered nurse** or medical practitioner. If the triage category changes, both triage categories can be captured, but the original category must be reported in this data element.

A triage category should not be assigned for patients who have a Type of visit of 'Dead on arrival, emergency department clinician certified the death of the patient'.

Source and reference attributes

Conditional obligation:

This data item is to be recorded for patients who have one of the following Type of visit values recorded:

- Emergency department presentation;
- Return visit, planned;
- Pre-arranged admission;
- Patient in transit.

Triglyceride level (measured)

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—triglyceride level (measured), total millimoles per litre N[N].N

METeOR identifier: 359411

Registration status: Health, Standard 01/10/2008

Definition: A person's triglyceride level measured in millimoles per litre.

Data Element Concept: Person—triglyceride level

Value domain attributes

Representational attributes

Representation class: Total

Data type: Number

Format: N[N].N

Maximum character length: 3

Supplementary values:

Value	Meaning
99.9	Not stated/inadequately described.

Unit of measure: Millimole per litre (mmol/L)

Data element attributes

Collection and usage attributes

Guide for use: Record the absolute result of the total triglyceride measurement.

Collection methods: Measurement of lipid levels should be carried out by laboratories, or practices, which have been accredited to perform these tests by the National Association of Testing Authorities.

- To be collected as a single venous blood sample, preferably following a 12-hour fast where only water and medications have been consumed.

Note that to calculate the low-density lipoprotein - cholesterol (LDL-C) from the Friedwald Equation (Friedwald et al, 1972):

- a fasting level of plasma triglyceride and knowledge of the levels of plasma total cholesterol and high-density lipoprotein - cholesterol (HDL-C) is required,
- the Friedwald equation becomes unreliable when the

plasma triglyceride exceeds 4.5 mmol/L, and

- that while levels are reliable for the first 24 hours after the onset of acute coronary syndromes, they may be unreliable for the subsequent 8 weeks after an event.

Tumour size at diagnosis (solid tumours)

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person with cancer—solid tumour size (at diagnosis), total millimetres NNN
METeOR identifier:	422642
Registration status:	Health, Standard 07/12/2011
Definition:	The largest dimension of a solid tumour, measured in millimetres.
Data Element Concept:	Person with cancer—solid tumour size

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	String
Format:	NNN
Maximum character length:	3

Supplementary values:

Value	Meaning
999	Unknown

Unit of measure: Millimetre (mm)

Collection and usage attributes

Guide for use: Size in millimetres with valid values 001 to 997.

Data element attributes

Collection and usage attributes

Guide for use: The reporting standard for the size of solid tumours is:

- Breast cancer or other solid neoplasms - the largest tumour dimension, measured to a precision of 1mm
- Round to the nearest millimetre, rounding up if size is ≥ .5 mm (e.g. 1.50mm, 1.54mm recorded as 2mm, 1.47mm recorded as 1mm).

General coding rules:

Recorded size:

- Only record measured size if stated, otherwise record size as unknown. Do not attempt to estimate size from descriptions of the tumour, such as ‘tumour occupying three quarters of tissue’
- Do not take values for size from sources other than

histopathology (such as imaging, mammography or clinical examination).

Size reported for multiple specimens:

- If tumour is removed in more than one procedure (e.g. biopsy and excision, local excision and re-excision) do not sum the sizes across multiple pathology reports but rather use the larger of the measured sizes from the separate pathology reports
- If tumour is divided into several parts (in the same pathology report), do not sum sizes together but rather use the larger of the measured sizes. However, if the pathologist states an aggregate or composite size, record that size.

Multifocal tumour:

- If the tumour is multifocal, record the size of the largest measured focus. Do not attempt to sum sizes of different foci.

Macroscopic size:

- If only macroscopic size is given, record this value
- If the macroscopic and microscopic measurements differ, the microscopic measurement should be recorded.

Exclusions:

- Size is not recorded for Phyllodes tumours, sarcomas, or lymphomas.

Invasive breast cancer coding rules:

Note: These rules are to be used only when the record pertains to an invasive breast cancer (as per Person with cancer-primary site of cancer, topography code (ICD-O-3) ANN.N.

Invasive tumours with an in situ component:

- When an invasive tumour contains an in situ component, only record the size of the invasive component as stated
- If the size of the invasive tumour is not recorded separately to the in situ component, then record the total size of the tumour without any attempt to estimate the invasive component using percentage or size of the in situ component.

Microinvasive tumour:

- For microinvasive tumours, record size in millimetres if stated. If microinvasion is stated but no size is recorded, enter 990 in size field to enable these very small tumours to be differentiated from other tumours without measured sizes.

Bilateral breasts tumours:

- Bilateral tumours are recorded as two separate primary tumours each having their own size (and other data elements).

Multifocal tumours with different morphology:

- Foci with different morphology should be considered to be separate primary tumours each having their own size (and other data elements). The coder needs to ascertain whether two foci with differing morphology are separate primaries with different morphology or a single multifocal primary with a mixed histology. In the latter case the rule of taking the size from the larger focus would apply as stated.

Collection methods: This information should be obtained from the patient's pathology reports.

Comments: The diameter of the largest dimension of solid neoplasms is collected for patient management, population cancer statistics and research.

Collection and usage attributes

Guide for use: CODE 3 Residential aged care service

Includes nursing home beds in acute care hospitals.

CODE 4 Specialised alcohol/other drug treatment residence

Includes alcohol/other drug treatment units in psychiatric hospitals.

CODE 5 Specialised mental health community-based residential support service

Specialised mental health community-based residential support services are defined as community-based residential supported accommodation specifically targeted at people with psychiatric disabilities which provides 24-hour support/rehabilitation on a residential basis.

CODE 6 Domestic-scale supported living facility (e.g. group home for people with disability)

Domestic-scale supported living facilities include group homes for people with disability, cluster apartments where a support worker lives on-site, community residential apartments (except mental health), congregate care arrangements. Support is provided by staff on either a live-in or rostered basis, and they may or may not have 24-hour supervision and care.

CODE 10 Other supported accommodation

Includes other supported accommodation facilities such as hostels for people with disability and Residential Services/Facilities (Victoria and South Australia only). These facilities provide board and lodging and rostered care workers provide client support services.

Data element attributes

Collection and usage attributes

Guide for use: 'Usual' is defined as the type of accommodation the person has lived in for the most amount of time over the past three months prior to admission to institutional health care or first contact with a community service setting. If a person stays in a particular place of accommodation for four or more days a week over the period, that place of accommodation would be the person's type of usual accommodation. In practice, receiving an answer to questioning about a person's usual accommodation setting may be difficult to achieve. The place the person perceives as their usual accommodation will often prove to be the best approximation of their type of usual accommodation.

Comments: The changes made to this metadata item are in accordance with the requirements of the National Mental Health Information Strategy Committee and take into consideration corresponding definitions in other data dictionaries (e.g. Home and Community Care Data Dictionary Version 1 and National Community Services Data Dictionary Version 1).

Type of augmentation of labour

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Birth event—labour augmentation type, code N
METeOR identifier:	270036
Registration status:	Health, Standard 01/03/2005
Definition:	Methods used to assist progress of labour, as represented by a code.
Data Element Concept:	Birth event—labour augmentation type

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

	Value	Meaning
Permissible values:	0	None
	1	Oxytocin
	2	Prostaglandins
	3	Artificial rupture of membranes (ARM)
	4	Other
Supplementary values:	5	Not stated

Collection and usage attributes

Comments:

Prostaglandin is listed as a method of augmentation in the data domain. Advice from the Royal Australian and New Zealand College of Obstetricians and Gynaecologists and the manufacturer indicates that vaginal prostaglandin use is not recommended or supported as a method of augmentation of labour as it may significantly increase the risk of uterine hyperstimulation. In spite of this, the method is being used and it is considered important to monitor its use for augmentation.

Data element attributes

Collection and usage attributes

Guide for use:

More than one method of augmentation can be recorded, except where 0=none applies.

Collection units need to edit carefully the use of prostaglandins as an augmentation method. Results from checking records have shown that either the onset of labour was incorrect or that the augmentation method was incorrectly selected.

Comments: Type of augmentation determines the progress and duration of labour and may influence the method of delivery and the health status of the baby at birth.

Source and reference attributes

Technical name:	Person—type of chronic condition, code N
METeOR identifier:	399218
Registration status:	Health, Standard 25/08/2011
Definition:	The type of chronic condition from which a person suffers, as represented by a code.
Data Element Concept:	Person—type of chronic condition

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Asthma
2	Cancer
3	Cardiovascular disease
4	Arthritis
5	Diabetes

Collection and usage attributes

Guide for use: CODE 1 Asthma

A chronic inflammatory disorder of the airways. In susceptible individuals, this inflammation causes recurrent episodes of wheezing, breathlessness, chest tightness, and coughing, particularly at night or in the early morning. These episodes are usually associated with widespread but variable airflow obstruction that is often reversible either spontaneously or with treatment. The inflammation also causes an associated increase in the existing bronchial hyperresponsiveness to a variety of stimuli.

CODE 2 Cancer

Cancer, also called malignancy, is a term for diseases in which abnormal cells divide without control and can invade nearby tissues. Cancer cells can also spread to other parts of the body through the blood and lymph systems. Cancer includes carcinoma, sarcoma, leukemia, lymphoma and multiple myeloma and central nervous system cancers. Excludes non-melanoma skin cancer.

CODE 3 Cardiovascular disease

A disease affecting the heart or blood vessels. Cardiovascular diseases include arteriosclerosis, coronary artery disease, heart valve disease, arrhythmia, heart failure, hypertension, orthostatic hypotension, shock, endocarditis, diseases of the aorta and its branches, disorders of the peripheral vascular system, and congenital heart disease.

CODE 4 Arthritis

An umbrella term for more than 100 medical conditions that affect the musculoskeletal system, specifically joints. The three most common forms of arthritis are osteoarthritis, rheumatoid arthritis and gout.

CODE 5 Diabetes

A disease marked by high blood glucose levels resulting from defective insulin production, insulin action or both. The three main types of diabetes are type 1 diabetes, type 2 diabetes and gestational diabetes.

Data element attributes

Collection and usage attributes

Guide for use: This data element should be used in conjunction with the data elements: *Person – specific chronic condition indicator, yes/no code N* and *Person – chronic condition indicator, yes/no code N* to obtain information on a person's current and past chronic conditions.

For code 3 Cardiovascular disease instruct the respondent to include conditions which can be controlled by medication.

Comments: Arthritis, asthma, cancer, diabetes and cardiovascular disease contribute significantly to the burden of illness and injury in Australia. Consequently these chronic conditions have been identified as National Health Priority Areas. Targeting these areas can potentially reduce the burden of disease experienced by people with these conditions and reduce health care required and associated costs.

Conditional obligation:
Conditional on the person being told they have a chronic condition.

Type of compensatory payment to other party

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Medical indemnity claim—type of compensatory payment to other party, code N[N]
METeOR identifier:	329798
Registration status:	Health, Standard 07/12/2011
Definition:	A description of the categories of loss for which an other party is compensated as a basis for a medical indemnity claim, as represented by a code.
Data Element Concept:	Medical indemnity claim—type of compensatory payment to other party

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Number
Format:	N[N]
Maximum character length:	2

	Value	Meaning
Permissible values:	1	Care costs
	2	Other economic loss
	3	Nervous shock
	4	Other pain and suffering (excluding nervous shock)
	5	Loss of consortium
	9	Medical costs
	12	No payment to an other party
	88	Other loss
Supplementary values:	97	Not applicable—patient is the only claimant
	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Care costs

‘Care costs’ include long-term care costs, and covers both past and future care costs, whether provided gratuitously or otherwise.

CODE 2 Other economic loss

‘Other economic loss’ includes past and future economic loss and past and future out-of-pocket expenses. It also includes dependency claims following the death of the patient, that is loss of the economic benefits provided by the patient. Care and medical costs are excluded.

CODE 3 Nervous shock

'Nervous shock' applies to psychiatric damage severe enough to amount to a recognised mental illness, such as anxiety neurosis or reactive depression, extending beyond grief or emotional distress.

CODE 4 Other pain and suffering (excluding nervous shock)

'Other pain and suffering (excluding nervous shock)' includes general damages, but excludes nervous shock.

CODE 5 Loss of consortium

'Loss of consortium' refers to damages awarded to a family member (usually a spouse) for loss of companionship.

CODE 9 Medical costs

'Medical costs' include costs associated with medical treatment (both past and future), for example, doctor's fees or hospital expenses.

CODE 12 No payment to an other party

'No payment to an other party' should be recorded where a medical indemnity claim is closed and no compensatory payment has been made to another party.

CODE 88 Other loss

'Other loss' includes any other loss not covered by the other codes for which an other party is compensated.

CODE 97 Not applicable—patient is the only claimant

'Not applicable—patient is the only claimant' should be recorded where a medical indemnity claim is based on an allegation of loss to the patient, not to an other party.

CODE 99 Not stated/inadequately described

'Not stated/inadequately described' should be recorded when the information is not currently available.

More than one code (excluding Code 99) may be recorded.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Data element attributes

Collection and usage attributes

Comments: During development of the Medical Indemnity National Collection it was decided that an item for recording broad categories of loss was needed. Where the medical indemnity claim relates to loss suffered by an other party or parties, whether solely or in combination with loss suffered by the patient, it is relevant to record the nature of this loss separately to the loss suffered by the patient.

Permissible values:	Value	Meaning
	1	Care costs
	2	Other economic loss
	3	Pain and suffering (including nervous shock)
	7	Medical costs
	8	Other loss
	9	No payment to patient
Supplementary values:	97	Not applicable—patient is not a claimant
	99	Not stated/inadequately described

Collection and usage attributes

Guide for use:

CODE 1 Care costs

'Care costs' include long-term care costs, and covers both past and future care costs, whether provided gratuitously or otherwise.

CODE 2 Other economic loss

'Other economic loss' includes past and future economic loss and past and future out-of-pocket expenses; excluding care and medical costs.

CODE 3 Pain and suffering (including nervous shock)

'Pain and suffering (including nervous shock)' includes temporary or ongoing disability and general damages. 'Nervous shock' applies to psychiatric damage severe enough to amount to a recognised mental illness, such as anxiety neurosis or reactive depression, extending beyond grief or emotional distress.

CODE 7 Medical costs

'Medical costs' includes costs associated with medical treatment (both past and future), for example, doctor's fees or hospital expenses.

CODE 8 Other loss

'Other loss' includes any other loss, not covered by the other codes for which the patient is compensated.

CODE 9 No payment to patient

'No payment to patient' should be recorded where a medical indemnity claim is closed and no compensatory payment has been made to the patient.

CODE 97 Not applicable—patient is not a claimant

'Not applicable—patient is not a claimant' should be recorded where a medical indemnity claim is based on an allegation of loss to an other party, not the patient. For example, where the claimant ('other party') is a spouse claiming for nervous shock allegedly suffered as a result of the injuries to the patient.

CODE 99 Not stated/inadequately described

'Not stated/inadequately described' should be recorded when the information is not currently available.

More than one code (excluding Code 99) may be recorded.

2	Juvenile detention centre

Collection and usage attributes

Guide for use:

CODE 1 Adult prison

A place which is the responsibility of a corrective services department, and may be operated by that department or by a private company, where individuals are detained while under the supervision on remand (pre–sentence) or a sentence of imprisonment.

CODE 2 Juvenile detention centre

A place administered and operated by a juvenile justice agency, where young people are detained while under the supervision of the relevant juvenile justice agency. Young people usually refers to people aged 10-17 years, however, it is possible for young people who are 18 years or older to be under juvenile justice supervision.

Collection and usage attributes

Guide for use:

CODE 101 Admitted patient care – Mental health program

An **admission** to a mental health program includes:

The component of the mental health program that provides admitted patient care. These services are delivered through specialised psychiatric hospitals and designated psychiatric units located within hospitals that are not specialised psychiatric hospitals.

NOTE: This is the admitted patient component of the mental health care program reported to the Mental Health Establishments NMDS.

Excludes residential care mental health programs, **ambulatory care** mental health programs which are provided as **outpatient** and **emergency department** care to non-admitted patients, and community-based (non-hospital) mental health programs.

CODE 102 Admitted patient care – Non-mental health program

An admitted patient non-mental health program includes:

All services, excluding mental health services, provided to admitted patients, including acute care, rehabilitative care, palliative care, geriatric evaluation and management, psychogeriatric care, maintenance care, newborn care and any other admitted patient care e.g. organ procurement – posthumous. Also includes admitted patient services where service delivery is contracted to private hospitals or treatment facilities and **hospital in the home** services.

Excludes emergency department and outpatient care provided to non-admitted patients, and community-based (non hospital) care.

CODE 199 Admitted patient care – Not further defined

Comprises admitted patient care services that could be a combination of categories 101 and 102 but which could not be further disaggregated.

State and territory health authorities are only to report admitted patient care under codes 101 or 102.

CODE 201 Residential care – Mental health program

A residential mental health care program includes:

The component of the specialised mental health program that provides residential care. A **resident** in one **residential mental health service** cannot be concurrently a resident in another residential mental health service. A resident in a residential mental health service can be concurrently a patient admitted to a hospital.

Comprises the residential component of the mental health care program reported to the Mental Health Establishments NMDS.

Excludes residential aged care services, residential disability, alcohol and other drug treatment health care services and residential type care provided to admitted patients in hospitals. Also excludes mental health programs provided to admitted patients, emergency and outpatient care patients, and community health (non-hospital) and other ambulatory care patients.

CODE 202 Residential care – Non-mental health program

A residential non-mental health care program includes alcohol and other drug treatment health care services.

Excludes residential mental health care program services, residential aged care services, residential disability services and residential type care provided to admitted patients in hospitals. Also excludes services provided to admitted patients and patients receiving ambulatory care.

CODE 299 Residential care – Not further defined

Comprises residential care services that could be a combination of categories 201 and 202 but which could not be further disaggregated.

State and territory health authorities are only to report residential care under codes 201 or 202.

CODE 301 Ambulatory care – Mental health program

The component of a specialised mental health program supplied by a specialised mental health service that provides **ambulatory health care**.

Comprises the ambulatory component of the mental health care program reported to the Mental Health Establishments NMDS, i.e. specialised mental health program services provided by emergency departments, outpatient clinics and community-based (non-hospital) services.

Excludes specialised mental health care provided to admitted and residential patients.

CODE 302 Ambulatory care – Emergency department

Comprises emergency department services provided in an **emergency department**.

Excludes specialised mental health services provided by emergency departments, outpatient clinics and community-based (non-hospital) services. Also excludes residential and admitted patient services.

CODE 303 Ambulatory care – General practitioner

This item is not currently required to be reported by state and territory health authorities.

The definition relates to the broad type of non-referred general practitioner services as specified on the Medicare Benefits Schedule website. These services comprise general practitioner attendances, including General Practitioner, Vocationally Registered General Practitioner (GP/VRGP) and other non-referred attendances, to non-admitted patients, and services provided by a practice nurse or registered Aboriginal Health Worker on behalf of a general practitioner.

This category is not limited to services funded by Medicare Australia. It also includes services funded from other sources such as Motor Vehicle Third Party Insurance and Workers Compensation Insurance, among others. Therefore, general or nurse practitioner services such as vaccinations for overseas travel are included regardless of their funding source. These non-referred general practitioner services are provided in private or group practices in medical clinics, community health care centres or hospital outpatient clinics.

Excludes mental health care services reported under code 301 and services provided to non-admitted patients in an emergency department.

CODE 304 Ambulatory care – Medical specialist

This item is not currently required to be reported by state and territory health authorities.

Specialist attendances, obstetrics, anaesthetics, radiotherapy, operations and assistance at operations care. These services are defined in the current Medicare Benefits Schedule. Includes services funded by Medicare Benefits Scheme, Motor Vehicle Third Party Insurance, Workers Compensation Insurance and from patient out-of-pocket payments. These services are provided in private or group practices in medical clinics, community health care centres or hospital outpatient clinics.

Includes salaried medical officers.

Excludes mental health care services reported under code 301 and services provided to non-admitted patients in an emergency department.

CODE 305 Ambulatory care – Imaging/pathology service.

This item is not currently required to be reported by state and territory health authorities.

Pathology and diagnostic imaging services as defined in the current Medicare Benefits Schedule. Includes services funded by Medicare Benefits Scheme, Motor Vehicle Third Party Insurance, Workers Compensation Insurance and from patient out-of-pocket payments. These services are provided in private or group practices in medical clinics, community health care centres or hospital outpatient clinics.

Excludes services provided to admitted or residential care patients and non-admitted patients in an emergency department.

CODE 306 Ambulatory care – Dental service

Includes any non-admitted patient and community dental services, including dental assessments, preventative services and treatments, regardless of funding source. Oral and maxillofacial services and cleft lip and palate services, as defined in the current Medicare Benefits Schedule, are also included in this category.

Includes dental services funded from a range of sources such as Medicare Benefits Scheme, Motor Vehicle Third Party Insurance and dental services funded by vouchers for dental care.

These dental services are provided in private or group practices in dental clinics, community health care centres or hospital outpatient clinics.

Excludes dental care provided to admitted patients in hospitals (same day or overnight) or to non-admitted patients in an emergency department.

CODE 307 Ambulatory care – Optometry service

This item is not currently required to be reported by state and territory health authorities.

Optometry services as defined in the current Medicare Benefits Schedule. Includes services funded by Medicare Benefits Scheme, Motor Vehicle Third Party Insurance, Workers Compensation Insurance and from patient out-of-pocket payments. These services are mainly provided in private or group practices, but may be provided in hospital outpatient centres.

Excludes optometry services provided to admitted or residential care patients or to non-admitted patients in an emergency department.

CODE 308 Ambulatory care – Allied health service

Includes services provided by the following allied health items. Aboriginal health worker, diabetes educator, audiologists, exercise physiologist, dietician, mental health worker, occupational therapist, physiotherapist, podiatrist or chiropodist, chiropractor, osteopath, psychologist and speech pathologist. These services are defined in the current Medicare Benefits Schedule. Includes services funded by Medicare Benefits Scheme, Motor Vehicle Third Party Insurance, Workers Compensation Insurance and from patient out-of-pocket payments.

Excludes allied health services provided to admitted or residential care patients or to non-admitted patients in an emergency department.

CODE 309 Ambulatory care – Community health services

Includes community health services such as family, maternal, child and youth health (including well baby clinics) as well as Aboriginal and Torres Strait Islander and migrant health services. Also includes health care for people with acute, post-acute, chronic and end of life illnesses, alcohol and drug treatment services, child psychology services, community midwifery, community nursing, school and district nursing, community rehabilitation, continence services, telehealth, dietetics, family planning and correctional health services.

Excludes mental health services reported under code 301 and services provided to admitted and residential care patients and non-admitted patients in an emergency department. Also excludes services already reported under codes 303 to 308.

CODE 388 Ambulatory care – Other

Comprises ambulatory care services other than those reported under codes 301 to 309.

CODE 399 Ambulatory care – Not further defined

Comprises ambulatory care services that could be a combination of categories 301 to 309 and 388, but which could not be further disaggregated, such as public outpatient services.

CODE 401 Public health – Communicable disease control

This category includes all activities associated with the development and implementation of programs to prevent the spread of communicable diseases.

Communicable disease control is recorded using three sub-categories:

HIV/AIDS, hepatitis C and sexually transmitted infections

Needle and syringe programs

Other communicable disease control.

The **public health** component of the HIV/AIDS, hepatitis C and STI strategies includes all activities associated with the development and implementation of prevention and education programs to prevent the spread of HIV/AIDS, hepatitis C and sexually transmitted infections.

CODE 402 Public health – Selected health promotion

This category includes those activities fostering healthy lifestyle and a healthy social environment overall, and health promotion activities targeted at health risk factors which lead to injuries, skin cancer and cardiovascular disease (for example diet, inactivity) that are delivered on a population-wide basis. The underlying criterion for the inclusion of health promotion programs within this category was that they are population health programs promoting health and wellbeing.

The Selected health promotion programs are:

Healthy settings (for example municipal health planning)

Public health nutrition

Exercise and physical activity

Personal hygiene

Mental health awareness promotion

Sun exposure and protection

Injury prevention including suicide prevention and female genital mutilation.

CODE 403 Public health – Organised immunisation

This category includes immunisation clinics, school immunisation programs, immunisation education, public awareness, immunisation databases and information systems.

Organised immunisation is recorded using three sub-categories:

Organised childhood immunisation (as defined by the National Health and Medical Research Council Schedule/Australian Standard Vaccination Schedule)

Organised pneumococcal and influenza immunisation—the target groups for pneumococcal immunisation are Indigenous people over 50 years and high-risk Indigenous younger people aged 15–49 years. Influenza vaccine is available free to all Australians 65 years of age and over, Indigenous people over 50 years and high-risk Indigenous younger people aged 15–19 years.

All other organised immunisation (for example tetanus)—as opposed to ad hoc or opportunistic immunisation.

CODE 404 Public health – Environmental health

This category relates to health protection education (for example safe chemical storage, water pollutants), expert advice on specific issues, development of standards, risk management and public health aspects of environmental health protection. The costs of monitoring and regulating are to be included where costs are borne by a regulatory agency and principally have a public health focus (for example radiation safety, and pharmaceutical regulation and safety).

CODE 405 Public health – Food standards and hygiene

This category includes the development, review and implementation of food standards, regulations and legislation as well as the testing of food by the regulatory agency.

CODE 406 Public health – Breast cancer screening

This category relates to Breast cancer screening and includes the complete breast cancer screening pathway through organised programs.

The breast cancer screening pathway includes such activities as recruitment, screen taking, screen reading, assessment (this includes fine needle biopsy), core biopsy, open biopsy, service management and program management.

CODE 407 Public health – Cervical screening

This category relates to organised cervical screening programs such as the state cervical screening programs and rural access programs, including coordination, provision of screens and assessment services.

Cervical screening, funded through Medicare, for both screening and diagnostic services is also included. The methodology used in deriving the estimates is set out in the Jurisdictions' technical notes (section 11.2 of NPHER 2004-05).

CODE 408 Public health – Bowel screening

This category relates to organised bowel screening programs, such as the National Bowel Cancer Screening Program (NBCSP) and the Bowel Cancer Screening Pilot program. The screening pathway includes self administered home based tests by persons turning 55 years or 65 years of age across Australia who mail results in for analysis, the assessment/diagnostic service and program management.

CODE 409 Public health – Prevention of hazardous and harmful drug use

This category includes activities targeted at the general population with the aim of reducing the overuse or abuse of alcohol, tobacco, illicit and other drugs of dependence, and mixed drugs. The Australian Standard Classification of Drugs of Concern includes analgesics, sedatives and hypnotics, stimulants and hallucinogens, anabolic agents and selected hormones, antidepressants and anti-psychotics, and also miscellaneous drugs of concern.

Report for each sub-category as below, the aggregate of which will be total expenditure on Prevention of hazardous and harmful drug use:

Alcohol

Tobacco

Illicit and other drugs of dependence

Mixed.

CODE 410 Public health – Public health research

The basic criterion for distinguishing public health research and development from other public health activities is the presence in research and development of an appreciable element of novelty and resolution of scientific and/or technical uncertainty.

Includes mainly new or one-off research in the 8 core public health functions listed under codes 401 to 409.

General research and development work relating to the running of ongoing public health programs is included under the other relevant public health activities in codes 401 to 409.

CODE 488 Public health – Other public health

Comprises public health functions not reported to the National Public Health Expenditure Project.

CODE 499 Public health – Not further defined

Comprises public health services that could be a combination of categories 401 to 410 but which could not be further disaggregated.

State and territory health authorities are only to report public health services under codes 401 to 409.

CODE 501 Health related care – Patient transport

This item comprises transportation in a specially-equipped surface vehicle or in a designated air ambulance to and from facilities for the purposes of receiving medical and surgical care.

Includes all government ambulance services and transport provided by the Royal Flying Doctors Service, care flight and similar services, emergency transport services of public fire rescue departments or defence that operate on a regular basis for civilian emergency services (not only for catastrophe medicine).

Includes transport between hospitals or other medical facilities and transport to or from a hospital or other medical facility and a private residence or other non-hospital/medical services location.

The provider of this service could be a public or private hospital or an ambulance service.

CODE 502 Health related care – Patient transport subsidies

Government subsidies to private ambulance services e.g. patient transport vouchers, support programs to assist isolated patients with travel to obtain specialised health care.

It also includes transportation in conventional vehicles, such as taxi, when the latter is authorised and the costs are reimbursed to the patient (e.g. for patients undergoing renal dialysis or chemotherapy).

CODE 503 Health related care – Medications

This item is not currently required to be reported by state and territory health authorities.

Includes pharmaceuticals and other medical non-durables, prescribed medicines and over-the-counter pharmaceuticals. Included within these categories are: medicinal preparations, branded and generic medicines, drugs, patent medicines, serums and vaccines, vitamins and minerals and oral contraceptives, prescribed medicines exclusively sold to customers with a medical voucher, irrespective of whether it is covered by public or private funding. Includes branded and generic products, private households' non-prescription medicines and a wide range of medical non-durables such as bandages, condoms and other mechanical contraceptive devices, elastic stockings, incontinence articles and toothbrushes, toothpastes and therapeutic mouth washes.

CODE 504 Health related care – Aids and appliances

This item is not currently required to be reported by state and territory health authorities.

This item comprises glasses and other vision products, orthopaedic appliances & other prosthetics, hearing aids, medico-technical devices including wheelchairs and all other miscellaneous medical durables not elsewhere classified such as blood pressure instruments.

CODE 505 Health related care – Health administration

Administrative services which cannot be allocated to a specific health good and service. Those unallocatable services might include, for example, maintaining an office of the Chief Medical Officer; a Departmental liaison officer in the office of the Minister; or a number of other agency-wide items for which it is not possible to derive appropriate or meaningful allocations to particular health programs.

CODE 506 Health related care – Health research

Includes all research on health topics that is not included in public health research (code 410). That is, it includes all research classified under ABS Australian Standard Research Classification code 320000, excluding code 321200.

Excludes public health research and non-health related research.

CODE 588 Health related care – Other

Includes for example, services provided by health and health-related call centres and e-health information services.

Excludes health related care reported under codes 501 to 506 and health assessments provided under the Aged Care Assessment Program which are reported under code 602.

CODE 599 Health related care – Not further defined

Comprises health related care that could be a combination of categories 501 to 506 but which could not be further disaggregated.

State and territory health authorities are only to report health related care under codes 501 to 506.

CODE 601 Other function – Home and community care

This item is not currently required to be reported by state and territory health authorities.

Comprises Home and Community Care services reported under the HACC NMDS.

Information on these service categories is available in the following report:

National classifications of community services. Version 2.0. AIHW Cat. No. HWI 40. Canberra: Australian Institute of Health and Welfare, 2003.

Excludes services reported under codes 602 to 604.

CODE 602 Other function – Aged care

This item is not currently required to be reported by state and territory health authorities.

Includes residential care aged care programs, aged care assessment programs and other non-health aged care programs, such as respite care and day care activities.

Excludes services provided under the HACC program.

CODE 603 Other function – Other welfare

This item is not currently required to be reported by state and territory health authorities.

Includes services delivered to clients, or groups of clients with special needs such as the young or the disabled. Excludes aged care services reported under code 602.

CODE 688 Other function – Other

This item is not currently required to be reported by state and territory health authorities. Includes for example, car parking, accommodation for staff or for patients' relatives, or non-health related research.

CODE 699 Other function – Not further defined

This item is not currently required to be reported by state and territory health authorities.

Comprises other functions that could be a combination of categories 601 to 603 but which could not be further disaggregated.

Type of substance used illicitly

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—type of substance used illicitly, drug of concern (ASCDC 2000 extended) code NNNN
METeOR identifier:	365401
Registration status:	Community Services, Standard 06/02/2012 Health, Standard 25/08/2011
Definition:	The type of substance used illicitly by a person, as represented by a code.
Data Element Concept:	Person—type of substance used illicitly

Value domain attributes

Representational attributes

Classification scheme:	Australian Standard Classification of Drugs of Concern 2011
Representation class:	Code
Data type:	String
Format:	NNNN
Maximum character length:	4

Supplementary values:

Value	Meaning
0005	Opioid analgesics not further defined
0006	Psychostimulants not further defined

Collection and usage attributes

Guide for use:

The Australian Standard Classification of Drugs of Concern (ASCDC) provides a number of supplementary codes that have specific uses and these are detailed within the ASCDC, e.g. 0000 = inadequately described.

Other supplementary codes that are not already specified in the ASCDC may be used in National Minimum Data Sets (NMDS) when required. In the Alcohol and other drug treatment service NMDS, two additional supplementary codes have been created which enable a finer level of detail to be captured:

CODE 0005 Opioid analgesics not further defined

This code is to be used when it is known that the client's principal drug of concern is an opioid but the specific opioid used is not known. The existing code 1000 combines opioid analgesics and non-opioid analgesics together into Analgesics nfd and the finer level of detail, although known, is lost.

CODE 0006 Psychostimulants not further defined

This code is to be used when it is known that the client's principal drug of concern is a psychostimulant but not which type. The existing code 3000 combines stimulants and hallucinogens together into Stimulants and hallucinogens nfd and the finer level of detail, although known, is lost.

Psychostimulants refer to the types of drugs that would normally be coded to 3100-3199, 3300-3399 and 3400-3499 categories plus 3903 and 3905.

Data element attributes

Collection and usage attributes

Guide for use: This data element is used in conjunction with the data element: *Person—substance used illicitly indicator, yes/no/not stated/inadequately described code N* to provide information on the type of substances a person has used illicitly.

Underlying cause of death

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Person—underlying cause of death, code (ICD-10 2nd edn) ANN-ANN

Synonymous names: UCOD code

METeOR identifier: 307931

Registration status: Health, Standard 01/10/2008

Definition: The disease or injury which initiated the train of morbid events leading directly to a person's death or the circumstances of the accident or violence which produced the fatal injury, as represented by a code. (WHO 2004)

Data Element Concept: Person—underlying cause of death

Value domain attributes

Representational attributes

Classification scheme: International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, (2nd edition)

Representation class: Code

Data type: String

Format: ANN-ANN

Maximum character length: 6

Data element attributes

Collection and usage attributes

Guide for use: Underlying cause of death is central to mortality coding and comparable international mortality reporting.

Comments: The Australian Bureau of Statistics (ABS) codes and classifies the underlying cause of death (UCOD) according to the rules and guidelines for mortality coding adopted by the World Health Assembly and set out in the World Health Organisation's International Classification of Diseases and Related Health Problems (ICD).

The ABS uses the Mortality Medical Data System (MMDS) to process and code cause-of-death information reported on death certificates.

	Value	Meaning
Permissible values:	1	Urgency status assigned - emergency
	2	Urgency status assigned - elective
	3	Urgency status not assigned
Supplementary values:	9	Not known/not reported

Data element attributes

Collection and usage attributes

Guide for use: CODE 1 Urgency status assigned - emergency

Emergency admission:

The following guidelines may be used by health professionals, hospitals and health insurers in determining whether an emergency admission has occurred. These guidelines should not be considered definitive.

An emergency admission occurs if one or more of the following clinical conditions are applicable such that the patient required admission within 24 hours.

Such a patient would be:

- at risk of serious morbidity or mortality and requiring urgent assessment and/or resuscitation; or

- suffering from suspected acute organ or system failure; or
- suffering from an illness or injury where the viability or function of a body part or organ is acutely threatened; or
- suffering from a drug overdoes, toxic substance or toxin effect; or
- experiencing severe psychiatric disturbance whereby the health of the patient or other people is at immediate risk; or
- suffering severe pain where the viability or function of a body part or organ is suspected to be acutely threatened; or
- suffering acute significant haemorrhage and requiring urgent assessment and treatment; or
- suffering gynaecological or obstetric complications; or
- suffering an acute condition which represents a significant threat to the patient's physical or psychological wellbeing; or
- suffering a condition which represents a significant threat to public health.

If an admission meets the definition of emergency above, it is categorised as emergency, regardless of whether the admission occurred within 24 hours of such a categorisation being made, or after 24 hours or more.

CODE 2 Urgency status assigned - Elective

Elective admissions:

If an admission meets the definition of elective above, it is categorised as elective, regardless of whether the admission actually occurred after 24 hours or more, or it occurred within 24 hours. The distinguishing characteristic is that the admission could be delayed by at least 24 hours.

Scheduled admissions:

A patient who expects to have an elective admission will often have that admission scheduled in advance. Whether or not the admission has been scheduled does not affect the categorisation of the admission as emergency or elective, which depends only on whether it meets the definitions above. That is, patients both with and without a scheduled admission can be admitted on either an emergency or elective basis.

Admissions from elective surgery waiting lists:

Patients on waiting lists for elective surgery are assigned a Clinical urgency status which indicates the clinical assessment of the urgency with which a patient requires elective hospital care. On admission, they will also be assigned an urgency of admission category, which may or may not be elective:

- Patients who are removed from elective surgery waiting lists on admission as an elective patient for the procedure for which they were waiting (see code 1 in metadata item Reason for removal from an elective surgery waiting list code N) will be assigned an Admission urgency status code N code of 2. In that case, their clinical urgency category could be regarded as further detail on how urgent their admission was.
- Patients who are removed from elective surgery waiting lists on admission as an emergency patient for the procedure for which they were waiting (see code 2 in metadata item Reason for removal from an elective surgery waiting list code N), will be assigned an Admission urgency status code N code of 1.

CODE 3 Urgency status not assigned

Admissions for which an urgency status is usually not assigned are:

- admissions for normal delivery (obstetric)
- admissions which begin with the birth of the patient, or when it was intended that the birth occur in the hospital, commence shortly after the birth of the patient
- statistical admissions
- planned readmissions for the patient to receive limited care or treatment for a current condition, for example dialysis or chemotherapy.

An urgency status can be assigned for admissions of the types listed above for which an urgency status is not usually assigned. For example, a patient who is to have an obstetric admission may have one or more of the clinical conditions listed above and be admitted on an emergency basis.

CODE 9 Not known/not reported

This code is used when it is not known whether or not an urgency status has been assigned, or when an urgency status has been assigned but is not known.

Collection and usage attributes

Collection methods: Ideally, Vascular procedure information is derived from and substantiated by clinical documentation.

Comments: In settings where the monitoring of a person's health is ongoing and where a history can change over time (such as general practice), the Service contact—service contact date, DDMMYYYY should be recorded.

	05	6/18
	06	6/24
	07	6/36
	08	6/60
	09	CF (count fingers)
	10	HM (hand movement)
	11	PL (perceive light)
	12	BL (blind)
	13	6/7.5
Supplementary values:	99	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: Record actual result for both right and left eyes:

- 1st field: Right eye
- 2nd field: Left eye.

Test wearing distance glasses if prescribed.

Use pinhole if vision less than 6/6.

Collection methods:

One of the most often utilised tests for visual acuity uses the Snellen chart.

- At a distance of 6 metres all subjects should be able to read the 6/6 line with each eye using the proper refractive correction.
- Both eyes are to be opened and then cover one eye with the ocular occluder.
- The observer has to read out the smallest line of letters that he/she can see from the chart.
- This is to be repeated with the other eye.

Eye examination should be performed by an ophthalmologist or a suitably trained clinician:

- within five years of **diagnosis** and then every 1-2 years for patients whose diabetes onset was at age under 30 years
- at diagnosis and then every 1-2 years for patients whose diabetes onset was at age 30 years or more.

Format: NN[N].N

Maximum character length: 4

Supplementary values:

Value	Meaning
999.9	Not measured

Unit of measure: Centimetre (cm)

Data element attributes

Collection and usage attributes

Collection methods: The collection of anthropometric measurements, particularly in those who are overweight or obese or who are concerned about their weight, should be performed with great sensitivity, and without drawing attention to an individual's weight.

The measurement protocol described below is that recommended by the World Health Organization (WHO Expert Committee 1995) which was adapted from Lohman et al. (1988) and the International Society for the Advancement of Kinanthropometry as described by Norton et al. (1996).

In order to ensure consistency in measurement, the following measurement protocol should be used.

Measurement protocol:

The measurement of waist circumference requires a narrow (7 mm wide), flexible, inelastic tape measure. The kind of tape used should be described and reported. The graduations on the tape measure should be at 0.1 cm intervals and the tape should have the capacity to measure up to 200 cm. Measurement intervals and labels should be clearly readable under all conditions of use of the tape measure.

The subject should remove any belts and heavy outer clothing. Measurement of waist circumference should be taken over at most one layer of light clothing. Ideally the measure is made directly over the skin.

The subject stands comfortably with weight evenly distributed on both feet, and the feet separated about 25-30 cm. The arms should hang loosely at the sides. Posture can affect waist circumference. The measurement is taken midway between the inferior margin of the last rib and the crest of the ilium, in the mid-axillary plane. Each landmark should be palpated and marked, and the midpoint determined with a tape measure and marked.

The circumference is measured with an inelastic tape maintained in a horizontal plane, at the end of normal expiration. The tape is snug, but does not compress underlying soft tissues. The measurer is positioned by the side of the subject to read the tape. To ensure contiguity of the two parts of the tape from which the circumference is to be determined, the cross-handed technique of measurement, as described by Norton et al. (1996), should be used. Ideally an assistant will check the position of the tape on the opposite side of the subject's body.

The measurement is recorded at the end of a normal expiration to the nearest 0.1 cm. Take a repeat measurement and record it to the nearest 0.1 cm. If the two measurements disagree by more than 1 cm, take a third measurement. All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject's measured waist circumference is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 cm. If so, rounding should be to the nearest even digit to reduce systematic over-reporting (Armitage & Berry 1994). For example, a mean value of 72.25 cm would be rounded to 72.2 cm, while a mean value of 72.35 cm would be rounded to 72.4 cm.

Validation and quality control measures:

Steel tapes should be checked against a 1 metre engineer's rule every 12 months. If tapes other than steel are used they should be checked daily against a steel rule.

Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within -) or different (between-) observers repeating the measurement, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement (Pederson & Gore 1996) between observers should not exceed 2% and be less than 1.5% within observers.

Extreme values at the lower and upper end of the distribution of measured waist circumference should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference.

Last-digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

Comments:

This metadata item is recommended for use in population surveys and health care settings.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For reporting purposes, it may be desirable to present waist circumference in categories. It is recommended that 5-cm groupings are used for this purpose. Waist circumference should not be rounded before categorisation. The following categories may be appropriate for describing the waist circumferences of Australian men, women children and adolescents, although the range will depend on the population.

Waist

35 cm = Waist

40 cm = Waist

... in 5 cm categories

105 cm = Waist

Waist => 110 cm

	3	Substantially increased (male waist circumference ≥ 102 cm, female waist circumference ≥ 88 cm)
Supplementary values:	9	Not stated/inadequately described

Data element attributes

Collection and usage attributes

Guide for use: This metadata item cannot be determined if waist circumference measured has not been collected (i.e. is coded to 999.9) and/or sex is not stated (i.e. coded to 9).

This metadata item applies to persons aged 18 years or older.

Collection methods: This metadata item should be derived after the data entry of waist circumference measured. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.

Comments: This metadata item is recommended for use in population surveys and health care settings.

Recent evidence suggests that waist circumference may provide a more practical correlate of abdominal fat distribution and associated ill health.

The identification of risk using waist circumference is population-specific and will depend on levels of obesity and other risk factors for cardiovascular disease and non-insulin dependent diabetes mellitus.

Populations differ in the level of risk associated with a particular waist circumference, so that globally applicable cut-off points cannot be developed. For example, complications associated with abdominal fat in black women and those of South Asian descent are markedly higher for a given level of BMI than in Europeans. Also, although women have almost the same absolute risk of coronary heart disease as men at the same WHR, they show increases in relative risk of coronary heart disease at lower waist circumferences than men. Thus, there is a need to develop sex-specific waist circumference cut-off points appropriate for different populations. Hence, the cut-off points used for this metadata item are associated with obesity in Caucasians. This issue is being investigated further.

Cut-off points for children and adolescents are also being developed. Research shows that a high childhood BMI and high trunk skin fold values are predictive of abdominal obesity as an adult and waist circumference measures in childhood track well into adulthood.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

National health metadata item currently exist for sex, date of birth, country of birth and Indigenous status and smoking. Metadata items are being developed for physical activity.

Waist-to-hip ratio

Identifying and definitional attributes

Metadata item type: Data Element

Technical name: Adult—waist-to-hip ratio, N.NN

METeOR identifier: 270207

Registration status: Health, Standard 01/03/2005

Definition: A ratio calculated by dividing the waist circumference of an adult person by the hip circumference of that same person.

Data Element Concept: Adult—waist-to-hip ratio

Value domain attributes

Representational attributes

Representation class: Ratio

Data type: Number

Format: N.NN

Maximum character length: 3

Data element attributes

Collection and usage attributes

Guide for use: Formula:

WHR = waist circumference (cm) divided by hip circumference (cm).

Adult WHR is a continuous variable. Adult WHR cannot be calculated if either component necessary for its calculation (i.e. abdominal circumference or hip circumference) has not been collected (i.e. is coded to 999.9).

Collection methods: As there are no cut-off points for waist to hip ratio for children and adolescents, it is not necessary to calculate this item for those aged under 18 years.

Waist-to-hip ratio (WHR) should be derived after the data entry of waist circumference and hip circumference. It should be stored on the raw data set as a continuous variable and should not be aggregated or rounded.

Comments: Adult cut-off points for WHR, that may define increased risk of cardiovascular disease and all cause mortality, range from 0.9 to 1.0 for men and 0.8 to 0.9 for women (Croft et al. 1995, Bray 1987, Bjorntorp 1985). These values are based primarily on evidence of increased risk of death in

European populations, and may not be appropriate for all age and ethnic groups.

In Australia and New Zealand, the cutoffs of >0.9 for males and >0.8 for females were used in the Australian Bureau of Statistics' 1995 National Nutrition Survey.

This metadata item applies to persons aged 18 years or older as no cut off points have been developed for children and adolescents. It is recommended for use in population surveys and health care settings.

More recently it has emerged that waist circumference alone, or in combination with other metabolic measures, is a better indicator of risk and reduces the errors in WHR measurements. WHR is therefore no longer a commonly used measure.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Body fat distribution has emerged as an important predictor of obesity-related morbidity and mortality. Abdominal obesity, which is more common in men than women, has, in epidemiological studies, been closely associated with conditions such as coronary heart disease, stroke, non-insulin dependent diabetes mellitus and high blood pressure.

Waist- to-hip ratio (WHR) can be used:

- to indicate the prevalence of abdominal obesity and its sociodemographic distribution (problem identification)
- to evaluate health promotion and disease prevention programs (assessment of interventions)
- to monitor progress towards national public health policy
- to ascertain determinants and consequences of abdominal obesity - in nutrition and physical activity surveillance and long-term planning.

Presentation of data:

Means, 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

Waiting list category

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective care waiting list episode—elective care type, code N
METeOR identifier:	470208
Registration status:	Health, Standard 13/12/2011
Definition:	The type of elective hospital care that a patient requires, as represented by a code.
Data Element Concept:	Elective care waiting list episode—elective care type

Value domain attributes

Representational attributes

Classification scheme:	Australian Classification of Health Interventions (ACHI) 7th edition
Representation class:	Code
Data type:	Number
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Elective surgery
2	Other

Collection and usage attributes

Guide for use:

Elective surgery comprises elective care where the procedures required by patients are listed in the surgical operations section of the Medicare benefits schedule, with the exclusion of specific procedures frequently done by non-surgical clinicians.

Elective care is care that, in the opinion of the treating clinician, is necessary and admission for which can be delayed for at least twenty-four hours.

CODE 1 Elective surgery

All elective surgery, that is excluding procedures listed in exclusion list for Code 2, should be included in this code.

CODE 2 Other

Patients awaiting the following procedures should be classified as Code 2 - other:

- biopsy of:

  kidney (needle only)

lung (needle only)
liver and gall bladder (needle only)

- bronchoscopy (including fibre-optic bronchoscopy) organ or tissue transplant procedures
- colonoscopy
- cosmetic surgery, i.e. when the procedure will not attract a Medicare rebate
- dental procedures not attracting a Medicare rebate
- endoscopic retrograde cholangio-pancreatography (ERCP)
- endoscopy of:
  biliary tract and pancreas
  oesophagus
  small intestine
  stomach
- endovascular interventional procedures
- gastroscopy
- haemodialysis
- in vitro fertilisation
- miscellaneous cardiac procedures
- miscellaneous lower urinary tract procedures
- oesophagoscopy
- organ or tissue transplant
- procedures associated with obstetrics (e.g. elective caesarean section, cervical suture)
- panendoscopy (except when involving the bladder)
- peritoneal and renal dialysis;
- proctosigmoidoscopy (including sigmoidoscopy, anoscopy)
- other diagnostic and non-surgical procedures.

These procedure terms are also defined by the Australian Classification of Health Interventions (ACHI) codes which are listed under Comments below. This coded list is the recommended, but optional, method for determining whether a patient is classified as requiring elective surgery or other care.

Comments: The table of Australian Classification of Health Interventions (ACHI) (7th edition) procedure codes was prepared by the National Centre for Classification in Health. Some codes were excluded from the list on the basis that they are usually performed by non-surgeon clinicians. A more extensive and detailed listing of procedure descriptors is under development. This will replace the list in the Guide for use to facilitate more readily the identification of the exclusions when the list of codes is not used.

ACHI CODES FOR THE EXCLUDED PROCEDURES:

Biopsy (needle) of:
• kidney: 36561-00 [1047]
• lung: 38812-00 [550]
• liver and gall bladder: 30409-00 [953] 30412-00 [953] 90319-01 [951] 30094-04 [964]

Bronchoscopy:
41889-00 [543] 41892-00 [544] 41904-00 [546] 41764-02 [416] 41895-00 [544] 41764-04 [532] 41892-01 [545] 41901-00 [545] 41898-00 [543] 41898-01 [544] 41889-01 [543] 41849-00 [520] 41764-03 [520] 41855-00 [520]

Dental:
Blocks [450] to [490] 97022-00 [451] 97025-00 [451] 97113-00 [453] 97121-01 [454] 97123-01 [454] 97165-01 [455] 97221-00 [456]
97222-00 [456] 97231-00 [456] 97232-00 [456] 97233-00 [456] 97234-00 [456] 97384-00 [461] 97386-01 [461] 97415-00 [462] 97417-00 [462] 97431-00 [463] 97433-00 [463] 97434-00 [463] 97437-00 [463] 97445-00 [464] 97455-00 [464] 97511-01 [465] 97512-01 [465] 97513-01 [465] 97514-02 [465] 97515-02 [465] 97541-01 [465] 97542-01 [465] 97543-01 [465] 97544-00 [465] 97545-00 [465] 97521-01 [466] 97522-01 [466] 97523-01 [466] 97524-00 [466] 97525-00 [466] 97531-00 [466] 97532-00 [466] 97533-00 [466] 97534-00 [466] 97535-00 [466] 97551-01 [466] 97552-01 [466] 97553-01 [466] 97554-01 [466] 97555-01 [466] 97572-01 [469] 97574-01 [469] 97575-00 [469] 97578-00 [469] 97582-01 [469] 97583-01 [469] 97631-00 [470] 97632-00 [471] 97649-00 [471] 97671-00 [473] 97672-00 [473] 97673-00 [473] 97732-00 [474] 97733-00 [474] 97739-00 [474] 97741-00 [475] 97762-00 [476] 97765-00 [476] 97768-00 [476] 97825-00 [479]

Endoscopy of biliary tract and pancreas:

Data element attributes

Collection and usage attributes

Collection methods: This data element is necessary for determining whether patients are in scope for both the Elective surgery waiting times (census data) NMDS 2012-2013 and the Elective surgery waiting times (removals data) NMDS 2012-2013 but is not explicitly included in either NMDS.

Waiting time at a census date

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Elective surgery waiting list episode—waiting time (at a census date), total days N[NNN]
METeOR identifier:	471715
Registration status:	Health, Standard 22/12/2011
Definition:	The time elapsed (in days) for a patient on the elective surgery waiting list from the date they were added to the waiting list to a designated census date.
Context:	Elective surgery
Data Element Concept:	Elective surgery waiting list episode—waiting time

Value domain attributes

Representational attributes

Representation class:	Total
Data type:	Number
Format:	N[NNN]
Maximum character length:	4
Unit of measure:	Day

Data element attributes

Collection and usage attributes

Guide for use:

The number of days is calculated by subtracting the *'Elective care waiting list episode—listing date for care, DDMMYYYY'* from the Hospital census (of elective surgery waitlist patients)—census date, DDMMYYYY, minus any days when the patient was 'not ready for care', and also minus any days the patient was waiting with a less urgent clinical urgency category than their clinical urgency category at the census date.

Days when the patient was not ready for care is calculated by subtracting the date(s) the person was recorded as 'not ready for care' from the date(s) the person was subsequently recorded as again being 'ready for care'.

If, at any time since being added to the waiting list for the elective surgical procedure, the patient has had a less urgent clinical urgency category than the category at the census date, then the number of days waited at the less urgent *'Elective surgery waiting list episode—clinical urgency,* *code N'* category should be subtracted from the total number of days waited.

In cases where there has been only one category reassignment (i.e. to the more urgent category attached to the patient at census date) the number of days at the less urgent clinical urgency category should be calculated by subtracting the *'Elective care waiting list episode—listing date for care, DDMMYYYY'* from the *'Elective care waiting list episode—category reassignment date, DDMMYYYY'*. If the patient's clinical urgency was reclassified more than once, days spent in each period of less urgent clinical urgency than the one applying at the census date should be calculated by subtracting one *'Elective care waiting list episode—category reassignment date, DDMMYYYY'* from the subsequent *'Elective care waiting list episode—category reassignment date, DDMMYYYY'*, and then adding the days together.

When a patient is admitted from an elective surgery waiting list but the surgery is cancelled and the patient remains on or is placed back on the waiting list within the same hospital, the time waited on the list should continue. Therefore at the census date the patient's waiting time includes the number of days waited on an elective surgery waiting list, both before and after any cancelled surgery admission. The time waited before the cancelled surgery should be counted as part of the total time waited by the patient.

Comments:

Elective surgery waiting times data collections include measures of waiting times at removal and at designated census dates. This metadata item is used to measure waiting times at a designated census date whereas the metadata item Elective surgery waiting list episode—waiting time (at removal), total days N[NNN] measures waiting times at removal.

The calculation of waiting times for patients who are transferred from an elective surgery waiting list managed by one public acute hospital to another will be investigated in the future. In this case, the amount of time waited on previous lists should follow the patient to the next. Therefore at the census date, their waiting time includes the total number of days on all lists (less days not ready for care and days in lower urgency categories).

This is a critical elective surgery waiting times metadata item. It is used to determine whether patients are overdue. It is used to assist doctors and patients in making decisions about hospital referral, to assist in the planning and management of hospitals and in health care related research.

Guide for use:

The number of days is calculated by subtracting the listing date for care from the removal date, minus any days when the patient was 'not ready for care', and also minus any days the patient was waiting with a less urgent clinical urgency category than their clinical urgency category at removal.

Days when the patient was not ready for care is calculated by subtracting the date(s) the person was recorded as 'not ready for care' from the date(s) the person was subsequently recorded as again being 'ready for care'.

If, at any time since being added to the waiting list for the elective surgical procedure, the patient has had a less urgent clinical urgency category than the category at removal, then the number of days waited at the less urgent clinical urgency category should be subtracted from the total number of days waited.

In cases where there has been only one category reassignment (i.e. to the more urgent category attached to the patient at removal) the number of days at the less urgent clinical urgency category should be calculated by subtracting the listing date for care from the category reassignment date. If the patient's clinical urgency was reclassified more than once, days spent in each period of less urgent clinical urgency than the one applying at removal should be calculated by subtracting one category reassignment date from the subsequent category reassignment date, and then adding the days together.

When a patient is removed from an elective surgery waiting list, for admission on an elective basis for the procedure they were awaiting, but the surgery is cancelled and the patient remains on or is placed back on the waiting list within the same hospital, the time waited on the list should continue.

Therefore at the removal date, the patient's waiting time includes the number of days waited on an elective surgery waiting list, both before and after any cancelled surgery admission. The time waited before the cancelled surgery should be counted as part of the total time waited by the patient.

Comments: Elective surgery waiting times data collections include measures of waiting times at removal and at designated census dates. This metadata item is used to measure waiting times at removal whereas the metadata item waiting time at a census date measures waiting times at a designated census date.

The calculation of waiting times for patients, who are transferred from an elective surgery waiting list managed by one public acute hospital to another, will be investigated in the future. In this case, the amount of time waited on previous lists would follow the patient to the next. Therefore when the patient is removed from the waiting list (for admission or other reason), their waiting time would include the total number of days on all lists (less days not ready for care and days in lower urgency categories).

This is a critical elective surgery waiting times metadata item. It is used to determine whether patients were overdue. It is used to assist doctors and patients in makign decisions about hospital referral, to assist in the planning and management of hospitals and in health care related research.

CODE 999 Not stated

Use this code if self-reported body mass (weight) is not responded to.

Data element attributes

Collection and usage attributes

Collection methods:

The method of data collection, e.g. face to face interview, telephone interview or self-completion questionnaire, can affect survey estimates and should be reported.

The data collection form should include a question asking the respondent what their weight is. For example, the ABS National Health Survey 1989-90 included the question 'How much do you weigh without clothes and shoes?'. The data collection form should allow for both metric (to the nearest 1 kg) and imperial (to the nearest 1 lb) units to be recorded.

If practical, it is preferable to enter the raw data into the data base before conversion of measures in imperial units to metric. However, if this is not possible, weight reported in imperial units can be converted to metric prior to data entry using a conversion factor of 0.454 kg to the lb.

Rounding to the nearest 1 kg will be required for measures converted to metric prior to data entry, and may be required for data reported in metric units to a greater level of precision than the nearest 1 kg. The following rounding conventions are desirable to reduce systematic over reporting (Armitage and Berry 1994):

nnn.x where x

nnn.x where x > 5 - round up, e.g. 72.7 kg would be rounded to 73 kg.

nnn.x where x = 5 - round to the nearest even number, e.g. 72.5 kg would be rounded to 72 kg, while 73.5 kg would be rounded to 74 kg.

Comments:

This metadata item is recommended for persons aged 18 years or older. It is recommended for use in population surveys when it is not possible to measure weight.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables. Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means and 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present weight data in categories. It is recommended that 5 kg groupings are used for this purpose. Weight data should not be rounded before categorisation. The following categories may be appropriate for describing the weights of

Australian men and women, although the range will depend on the population. The World Health Organization's range for weight is 30-140 kg.

Weight

30 kg = Weight

35 kg = Weight

... in 5 kg categories

135 kg = Weight

Weight => 140 kg

On average, body mass (weight) tends to be underestimated when self-reported by respondents. Data for men and women aged 20-69 years in 1989 indicated that men underestimated by an average of 0.2 kg (sem of 0.05 kg) and women by an average of 0.4 kg (sem of 0.04 kg) (Waters 1993). The extent of underestimation varied with age.

Data element attributes

Collection and usage attributes

Guide for use:

In order to ensure consistency in measurement, the measurement protocol described under Collection methods should be used.

Collection methods:

The collection of anthropometric measurements, particularly in those who are overweight or obese or who are concerned about their weight, should be performed with great sensitivity and without drawing attention to an individual's weight.

The measurement protocol described below is that recommended by the WHO Expert Committee (1995).

Measurement protocol:

Equipment used should be described and reported. Scales should have a resolution of at least 0.1kg and should have the capacity to weigh up to at least 200 kg. Measurement intervals and labels should be clearly readable under all conditions of use of the instrument. Scales should be capable of being calibrated across the entire range of measurements. Precision error should be no more than 0.1kg. Scales should be calibrated on each day of use. Manufacturers' guidelines should be followed with regard to the transportation of the scales.

Adults and children who can stand:

The subject stands over the centre of the weighing instrument, with the body weight evenly distributed between both feet.

Heavy jewellery should be removed and pockets emptied. Light indoor clothing can be worn, excluding shoes, belts, and sweater. Any variations from light indoor clothing (e.g. heavy clothing, such as kaftans or coats worn because of cultural practices) should be noted on the data collection form. Adjustments for non-standard clothing (i.e. other than light indoor clothing) should only be made in the data checking/cleaning stage prior to data analysis.

If the subject has had one or more limbs amputated, record this on the data collection form and weigh them as they are. If they are wearing an artificial limb, record this on the data collection form but do not ask them to remove it. Similarly, if they are not wearing the limb, record this but do not ask them to put it on.

The measurement is recorded to the nearest 0.1 kg. If the scales do not have a digital readout, take a repeat measurement. If the two measurements disagree by more than 0.5 kg, then take a third measurement. All raw measurements should be recorded on the data collection form. If practical, it is preferable to enter the raw data into the database as this enables intra-observer and, where relevant, inter-observer errors to be assessed. The subject's measured weight is subsequently calculated as the mean of the two observations, or the mean of the two closest measurements if a third is taken, and recorded on the form. If only a mean value is entered into the database then the data collection forms should be retained.

It may be necessary to round the mean value to the nearest 0.1 kg. If so, rounding should be to the nearest even digit to reduce systematic over reporting (Armitage and Berry 1994). For example, a mean value of 72.25 kg would be rounded to 72.2 kg, while a mean value of 72.35 kg would be rounded to 72.4 kg.

Infants:

Birth weight and gender should be recorded with gestational age. During infancy a levelled pan scale with a bean and movable weights or digital scales capable of measuring to two decimal places of a kilogram are acceptable. Birth weight should be determined within 12 hours of birth. The infant, with or without a nappy or diaper is placed on the scales so that the weight is distributed equally about the centre of the pan. When the infant is lying or suspended quietly, weight is recorded to the nearest 10 grams. If the nappy or diaper is worn, its weight is subtracted from the observed weight i.e. reference data for infants are based on nude weights.

Validation and quality control measures:

If practical, equipment should be checked daily using one or more objects of known weight in the range to be measured. It is recommended that the scale be calibrated at the extremes and in the mid range of the expected weight of the population being studied.

Within- and, if relevant, between-observer variability should be reported. They can be assessed by the same (within -) or different (between-) observers repeating the measurement of weight, on the same subjects, under standard conditions after a short time interval. The standard deviation of replicate measurements (technical error of measurement) between observers should not exceed 0.5 kg and be less than 0.5 kg within observers.

Extreme values at the lower and upper end of the distribution of measured height should be checked both during data collection and after data entry. Individuals should not be excluded on the basis of true biological difference.

Last digit preference, and preference or avoidance of certain values, should be analysed in the total sample and (if relevant) by observer, survey site and over time if the survey period is long.

Comments:

This metadata item applies to persons of all ages. It is recommended for use in population surveys and health care settings.

It is recommended that in population surveys, sociodemographic data including ethnicity should be collected, as well as other risk factors including physiological status (e.g. pregnancy), physical activity, smoking and alcohol consumption. Summary statistics may need to be adjusted for these variables.

Metadata items currently exist for sex, date of birth, country of birth, Indigenous status and smoking. Metadata items are being developed for physical activity.

Presentation of data:

Means and 95% confidence intervals, medians and centiles should be reported to one decimal place. Where the sample permits, population estimates should be presented by sex and 5-year age groups. However 5-year age groups are not generally suitable for children and adolescents. Estimates based on sample surveys may need to take into account sampling weights.

For consistency with conventional practice, and for current comparability with international data sets, recommended centiles are 5, 10, 15, 25, 50, 75, 85, 90 and 95. To estimate the 5th and 95th centiles, a sample size of at least 200 is recommended for each group for which the centiles are being specified.

For some reporting purposes, it may be desirable to present weight data in categories. It is recommended that 5 kg groupings are used for this purpose. Weight data should not be rounded before categorisation. The following categories may be appropriate for describing the weights of Australian men, women, children and adolescents, although the range will depend on the population.

Comments:

This data element is used to differentiate between establishments run by the government sector (code 1) and establishments that receive some government funding but are run by the non-government sector (code 2).

Code 1 Public

To be used when the establishment:

- operates from the public accounts of a Commonwealth, state or territory government or is part of the executive, judicial or legislative arms of government,
- is part of the general government sector or is controlled by some part of the general government sector,
- provides government services free of charge or at nominal prices, and
- is financed mainly from taxation.

Code 2 Private

To be used only when the establishment:

- is not controlled by government,
- is directed by a group of officers, an executive committee or a similar body elected by a majority of members, and
- may be an income tax exempt charity.

Community mental health service includes all non-residential health care services that engage primarily in mental health care.

CODE C03 COMMUNITY DRUG AND ALCOHOL SERVICE

Community drug and alcohol service includes all non-residential health care services that engage primarily in drug and alcohol treatment.

CODE C07 OTHER COMMUNITY HEALTH CARE SERVICES

Other community health care service includes all non-residential health care services not mentioned above.

CODE D01 OUTPATIENT SERVICES

Outpatient services include all hospital-based clinics that provide specialist outpatient services to non-admitted, non-emergency department patients.

CODE D02 OTHER HOSPITAL SERVICE

This category includes all other hospital services including acute care, psychiatric and dental hospitals, as well as emergency departments. It excludes hospitals provided by Defence Department

CODE E02 RESIDENTIAL MENTAL HEALTH CARE SERVICES

Residential mental health care services include all residential health care services that primarily engage in the delivery of specialist mental health care.

CODE E05 OTHER RESIDENTIAL HEALTH CARE

FACILITY

This category includes all other residential health care facilities not specified above.

CODE F00 COMMERCIAL/BUSINESS SERVICES

Commercial/business includes insurance providers, pathology laboratories, banks and pharmaceutical manufacturers, wholesalers and retailers. This category excludes private practices

CODE G01 TERTIARY EDUCATIONAL FACILITY

Tertiary educational facility includes all educational institutions mainly engaged in providing undergraduate or postgraduate teaching, or vocational education and training.

CODE G02 SCHOOL

Schools include all pre-primary, primary and secondary schools.

CODE G03 OTHER EDUCATIONAL FACILITY

Other educational facility includes all organisations primarily involved in the delivery of education and training but not mentioned above.

CODE H00 CORRECTIONAL SERVICES

Correctional services include jails and detention centres.

CODE I00 DEFENCE FORCES

Defence forces include all facilities operated by the Australian Government Department of Defence.

CODE J00 OTHER GOVERNMENT DEPARTMENT OR AGENCY

Other government department or agency includes all government facilities not specified above including laboratories and research organisations.

CODE Y00 OTHER

Other includes all organisations not specified above.

Collection and usage attributes

Guide for use:

CODE A00 PRIVATE PRACTICE

Private practice includes private practitioner rooms/ surgeries and 24-hour medical clinics.

CODE B00 ABORIGINAL HEALTH SERVICES

Aboriginal health services include all non-residential health care services with a primary focus on the delivery of health care to Indigenous people.

CODE C00 COMMUNITY HEALTH CARE SERVICES

Community health care services include ambulatory centres, day procedure centres and community health centres. This category excludes aboriginal health services and non-residential health care provided by private practices and the Australian Government Department of Defence.

CODE D00 HOSPITALS

Hospitals include acute care, psychiatric and dental hospitals as well as emergency departments and outpatient clinics. This category excludes hospitals provided by Defence Department.

CODE E00 RESIDENTIAL HEALTH CARE FACILITIES

Residential health care facilities include residential aged care, hospices, residential mental health care, residential drug rehabilitation and disability institutions.

CODE F00 COMMERCIAL/BUSINESS SERVICES

Commercial/business services include insurance providers, pathology laboratories, banks and pharmaceutical manufacturers, wholesalers and retailers. This category excludes private practices.

CODE G00 EDUCATIONAL FACILITY

Educational facilities include schools, universities, vocational education and training institutions.

CODE H00 CORRECTIONAL SERVICES

Correctional services include jails and detention centres.

CODE I00 DEFENCE FORCES

Defence forces include all facilities operated by the Australian Government Department of Defence.

CODE J00 OTHER GOVERNMENT DEPARTMENT OR AGENCY

Other government department or agency includes all government facilities not specified above including laboratories and research organisations.

CODE Y00 OTHER

Other includes all organisations not specified above.

Comments: This data element is used in conjunction with work sector and hours worked to collect data on the distribution of hour worked by registered health professionals.

Working partnership indicator

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Service provider organisation—working partnership indicator, yes/no code N
METeOR identifier:	290696
Registration status:	Health, Standard 05/12/2007
Definition:	Whether a service provider organisation has formal working partnership(s) with other service provider(s) or organisation(s), as represented by a code.
Data Element Concept:	Service provider organisation—working partnership indicator

Value domain attributes

Representational attributes

Representation class:	Code
Data type:	Boolean
Format:	N
Maximum character length:	1

Permissible values:

Value	Meaning
1	Yes
2	No

Data element attributes

Collection and usage attributes

Guide for use:

A formal working partnership involves arrangements between a service provider organisation and another service provider or organisation, aimed at providing integrated and seamless care, so that clients are able to move smoothly between services and service settings.

A formal working partnership is a verbal or written agreement between two or more parties. It specifies the roles and responsibilities of each party, including the expected outcomes of the agreement.

Key elements of a formal working partnership are that it is organised, routine, collaborative, and systematic. It excludes ad hoc arrangements. Examples of formal working partnerships include the existence of: written service agreements; formal liaison; referral and discharge planning processes; formal and routine consultation; protocols; partnership working groups; memoranda of understanding with other providers; and case conferencing.

CODE 1 Yes

The service provider organisation has formal working partnership(s) with other service provider(s) or organisation(s) in place.

CODE 2 No

The service provider organisation has no formal working partnership(s) with other service provider(s) or organisation(s) in place.

Collection methods: Record only one code.

Year of arrival in Australia

Identifying and definitional attributes

Metadata item type:	Data Element
Technical name:	Person—year of first arrival in Australia, date YYYY
METeOR identifier:	269929
Registration status:	Community Services, Standard 01/03/2005 Housing assistance, Standard 23/08/2010 Health, Standard 04/05/2005 Homelessness, Standard 23/08/2010
Definition:	The year a person (born outside of Australia) first arrived in Australia, from another country, with the intention of staying in Australia for one year or more.
Data Element Concept:	Person—year of first arrival in Australia

Value domain attributes

Representational attributes

Representation class:	Date
Data type:	Date/Time
Format:	YYYY
Maximum character length:	4

Data element attributes

Collection and usage attributes

Collection methods:

Actual year of arrival in Australia.

Recommended question:

In what year did you/the person first arrive in Australia to live here for one year or more?

(Write in the calendar year of arrival or mark the box if here less than one year)

Calendar year of arrival

Will be here less than one year

It is anticipated that for the majority of people their response to the question will be the year of their only arrival in Australia. However, some respondents may have multiple arrivals in Australia. To deal with these cases in self-enumerated collections, an instruction such as 'Please indicate the year of first arrival only' should be included with the question.

While agencies are encouraged to use the recommended question described above, it is acknowledged that this is not always possible in practice. For example, where the data collection is a by-product of the provision of a health or community service, the information may be ascertained using different means. However, the recommended question should be used wherever practically possible.

NMDS

Admitted patient care NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 466132

Registration status: Health, Standard 11/04/2012

DSS type: National Minimum Data Set (NMDS)

Scope: The purpose of the Admitted patient care national minimum data set (APC NMDS) is to collect information about care provided to admitted patients in Australian hospitals.

The scope of the APC NMDS is episodes of care for admitted patients in all public and private acute and psychiatric hospitals, free standing day hospital facilities and alcohol and drug treatment centres in Australia. Hospitals operated by the Australian Defence Force, corrections authorities and in Australia's off-shore territories may also be included. Hospitals specialising in dental, ophthalmic aids and other specialised acute medical or surgical care are included.

Hospital boarders and still births are not included as they are not admitted to hospital. Posthumous organ procurement episodes are also not included.

Collection and usage attributes

Statistical unit: Episodes of care for admitted patients

Collection methods: Data are collected at each hospital from patient administrative and clinical record systems. Hospitals forward data to the relevant state or territory health authority on a regular basis (e.g. monthly).

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Comments: *Scope links with other NMDS*

Episodes of care for admitted patients which occur partly or fully in designated psychiatric units of public acute hospitals or in public psychiatric hospitals:

- Admitted patient mental health care NMDS.

Episodes of care for admitted patients where care type is palliative care:

- Admitted patient palliative care NMDS.

Glossary items

Admitted patient mental health care NMDS 2012-2013

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	471383
Registration status:	Health, Standard 07/12/2011
DSS type:	National Minimum Data Set (NMDS)
Scope:	The scope of the Admitted patient mental health care national minimum data set (NMDS) is restricted to admitted patients receiving care in psychiatric hospitals or in designated psychiatric units in acute hospitals. The scope does not currently include patients who may be receiving treatment for psychiatric conditions in acute hospitals who are not in psychiatric units.

Collection and usage attributes

Statistical unit: Episodes of care for admitted patients

Collection methods: Data are collected at each hospital from patient administrative and clinical record systems. Hospitals forward data to the relevant state or territory health authority on a regular basis (for example, monthly).

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Comments: Number of days of hospital in the home care data will be collected from all states and territories except Western

Australia from 1 July 2001. Western Australia will begin to collect data from a later date.

Scope links with other NMDSs:

Episodes of care for admitted patients which occur partly or fully in designated psychiatric units of public acute hospitals or in public psychiatric hospitals:

Alcohol and other drug treatment services NMDS 2012-2013

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	466861
Registration status:	Health, Standard 07/12/2011
DSS type:	National Minimum Data Set (NMDS)

Scope:

This metadata set is nationally mandated for collection and reporting.

Publicly funded government and non-government agencies providing alcohol and/or drug treatment services. Including community-based ambulatory services and outpatient services.

The following services are currently not included in the coverage:

- services based in prisons and other correctional institutions;
- agencies that provide primarily accommodation or overnight stays such as 'sobering-up shelters' and 'half-way houses';
- agencies that provide services concerned primarily with health promotion;
- needle and syringe programs;
- agencies whose sole function is to provide prescribing and/or dosing of methadone; and
- acute care and psychiatric hospitals, or alcohol and drug treatment units that report to the Admitted patient care National Minimum Data Set and do not provide treatment to non-admitted patients.

Clients who are on a methadone maintenance program may be included in the collection where they also receive other types of treatment.

Collection and usage attributes

Statistical unit:

Completed treatment episodes for clients who participate in a treatment type as specified in the data element *Episode of treatment for alcohol and other drugs—treatment type (main), code N.*

Collection methods:

Data to be reported in each agency on completed treatment episode and then forwarded to state/territory authorities for collation.

National reporting requirements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Elective surgery waiting times (census data) NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 472477

Registration status: Health, Standard 13/12/2011

DSS type: National Minimum Data Set (NMDS)

Scope:

The scope of this national minimum data set (NMDS) is patients on waiting lists for elective surgery (as defined in the Elective care waiting list episode—elective care type, code N data element (also referred to by the short name 'Waiting list category') which are managed by public acute hospitals. This will include private patients treated in public hospitals, and may include public patients treated in private hospitals.

Hospitals may also collect information for other care (as defined in the Waiting list category data element), but this is not part of the NMDS for Elective surgery waiting times.

Patients on waiting lists managed by hospitals operated by the Australian Defence Force, corrections authorities and Australia's external territories are not currently included.

Census data:

Data are collected for patients on elective surgery waiting lists who are yet to be admitted to hospital or removed for another reason. The scope is patients on elective surgery waiting lists on a census date who are 'ready for care' and patients who are 'not ready for care', as defined in the Elective surgery waiting list episode—patient listing status, readiness for care code N data element.

Collection and usage attributes

Statistical unit: Patients on waiting lists on census dates.

Collection methods:

Elective care waiting list episode—category reassignment date, DDMMYYYY is not required for reporting to the NMDS, but is necessary for the derivation of Elective surgery waiting list episode—waiting time (at a census date), total days N[NNN].

Elective care waiting list episode—elective care type, code N is not required for reporting to the NMDS, but is necessary for determining whether patients are in scope for the NMDS. These data elements should be collected at the local level and reported to state and territory health authorities as required.

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Census dates are 30 September, 31 December, 31 March and 30 June.

Implementation start date: 30/09/2012

Comments: There are two different types of data collected for this national minimum data set (census data and removals data) and the scope and list of data elements associated with each is different.

For the purposes of this NMDS, public hospitals include hospitals which are set up to provide services for public patients (as public hospitals do), but which are managed privately.

The inclusion of public patients removed from elective surgery waiting lists managed by private hospitals will be investigated in the future.

Elective surgery waiting times (removals data) NMDS 2012-2013

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	472497
Registration status:	Health, Standard 13/12/2011
DSS type:	National Minimum Data Set (NMDS)

Scope:

The scope of this national minimum data set is patients removed from waiting lists for elective surgery (as defined in Elective care waiting list episode—elective care type, code N) which are managed by public acute hospitals. This will include private patients treated in public hospitals, and may include public patients treated in private hospitals. Hospitals may also collect information for other care (as defined in Elective care waiting list episode—elective care type, code N), but this is not part of the National Minimum Data Set (NMDS) for elective surgery waiting times.

Patients removed from waiting lists managed by hospitals operated by the Australian Defence Force, corrections authorities and Australia's external territories are not currently included.

Removals data:

Data are collected for patients who have been removed from an elective surgery waiting list (for admission or another reason). Patients who were 'ready for care' and patients who were 'not ready for care' at the time of removal are included.

Collection and usage attributes

Statistical unit:

Patients removed from waiting lists (for admission or other reason) during each financial year.

Collection methods:

Elective care waiting list episode—category reassignment date, DDMMYYYY is not required for reporting to the NMDS, but is necessary for the derivation of Elective surgery waiting list episode—waiting time (at removal), total days N[NNN]. Elective care waiting list episode—elective care type, code N is not required for reporting to the NMDS, but is necessary for determining whether patients are in scope for the NMDS. These data elements should be collected at the local level and reported to state and territory health authorities as required.

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year for removals data.

Implementation start date: 01/07/2012

Comments: There are two different types of data collected for this national minimum data set (census data and removals data) and the scope and list of data elements associated with each is different.

For the purposes of this NMDS, public hospitals include hospitals which are set up to provide services for public patients (as public hospitals do), but which are managed privately.

The inclusion of public patients removed from elective surgery waiting lists managed by private hospitals will be investigated in the future.

Government health expenditure NMDS 2009-2010

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 376403

Registration status: Health, Standard 01/04/2009

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of this dataset is direct government and government-funded expenditure on health and health–related goods and services.

The purpose of this NMDS is to provide an enhanced understanding of the overall financial resources (recurrent and capital) used by the health system, and of unit costs and performance; to enable greater comparability of health expenditure data between jurisdictions and over time; and to provide a more efficient compilation of national reports and analyses on government funded health expenditure.

Collection and usage attributes

Statistical unit: Providers of health or health related goods and services or non-health services that support the health services industry; health or health related functions; and the sources of funds for these providers or functions.

Guide for use: The GHE NMDS consists of 5 mandatory data clusters and 1 conditional data cluster.

The first two data elements named in each data cluster form one of the two axes of a matrix that combine to provide all data in Australian dollars.

Data are to be reported in Australian dollars except when reporting the State/Territory identifier of the Jurisdiction.

Collection methods: Data are collected by a number of providers from their administrative systems and forwarded to the relevant state or territory health authority on a regular basis (for example, monthly).

Hospitals forward data obtained from patient administrative and clinical record systems to the relevant state or territory health authority on a regular basis (for example, monthly). Other data are obtained either directly from annual reports or through surveys.

National reporting arrangements

State and Territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated:

Financial years ending 30 June each year.

Implementation start date: 01/07/2009

Mental health establishments NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 468195

Registration status: Health, Standard 07/12/2011

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of the Mental health establishments National Minimum Data Set (MHE NMDS) is all specialised mental health services managed by, or in receipt of funds from, state or territory health authorities.

Specialised mental health services are those with a primary function to provide treatment, rehabilitation or community health support targeted towards people with a mental disorder or psychiatric disability. These activities are delivered from a service or facility that is readily identifiable as both specialised and serving a mental health care function.

The concept of a specialised mental health service is not dependent on the inclusion of the service within the state or territory mental health budget.

A service is not defined as a specialised mental health service solely because its clients include people affected by a mental illness or psychiatric disability. The definition excludes specialist drug and alcohol services for people with intellectual disabilities, except where they are established to assist people affected by a mental disorder who also have drug and alcohol related disorders or intellectual disability.

These services can be a sub-unit of a hospital even where the hospital is not a specialised mental health establishment itself (e.g. designated psychiatric units and wards, outpatient clinics etc).

The statistical units are specialised mental health services. These are the specialised mental health components of the state and territory health authorities, and of regions within states and territories; specialised mental health service organisations; service units within those organisations; and private hospital and non-government residential service units funded by specialised mental health services.

Non-government residential mental health services and specialised mental health services provided by private hospitals that receive state or territory government funding are included as service units for this NMDS.

There is a hierarchy of statistical units used within the MHE NMDS. Information is provided at each level: State/Territory; Region; Organisation; Hospital/Service unit cluster; and Service unit (Admitted patient services, Residential services and Ambulatory services). Each level has a unique set of attributes which comprise the NMDS data elements and additional supplementary information.

Collection and usage attributes

Statistical unit: Specialised mental health service

Collection methods: *National reporting arrangements*

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Non-admitted patient emergency department care NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 474371

Registration status: Health, Standard 30/01/2012

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of the Non-admitted patient emergency department care national minimum data set specification (NAPEDC NMDS) is non-admitted patients registered for care in emergency departments in selected public hospitals that are classified as either Peer Group A or B in the Australian Institute of Health and Welfare's Australian Hospital Statistics publication from the preceding financial year (see also Scope links with other metadata sets in the Comments section below).

Patients who were dead on arrival are in scope if an emergency department clinician certified the death of the patient. Patients who leave the emergency department after being triaged and then advised of alternative treatment options are in scope.

The scope includes only physical presentations to emergency departments. Advice provided by telephone or videoconferencing is not in scope, although it is recognised that advice received by telehealth may form part of the care provided to patients physically receiving care in the emergency department.

The care provided to patients in emergency departments is, in most instances, recognised as being provided to 'non-admitted' patients. Patients being treated in emergency departments may subsequently become 'admitted' (including admission to a short stay unit, admission to elsewhere in the emergency department, admission to another hospital ward, or admission to hospital-in-the-home). All patients remain in scope for this collection until they are recorded as having physically departed the emergency department, regardless of whether they have been admitted. For this reason there is an overlap in scope of this NMDS and the Admitted patient care national minimum data set (APC NMDS).

Collection and usage attributes

Statistical unit: Emergency department stay.

Guide for use: The definition of a 'short stay unit' is as per clause C48 of the National Health Reform Agreement—National Partnership Agreement on Improving Public Hospital Services (NPA IPHS), as follows:

a) Designated and designed for the short term treatment, observation, assessment and reassessment of patients initially triaged and assessed in the emergency department (ED);

b) Have specific admission and discharge criteria and policies;

c) Designed for short term stays no longer than 24 hours;

d) Physically separated from the ED acute assessment area;

e) Have a static number of beds with oxygen, suction, patient ablution facilities; and

f) Not a temporary ED overflow area nor used to keep patients solely awaiting an inpatient bed nor awaiting treatment in the ED.

Collection methods: **National reporting arrangements**

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on a quarterly basis within one month of the end of a reporting period and an annual basis within three months of the reporting period.

The Institute and the Commonwealth Department of Health and Ageing will agree on a data quality and timeliness protocol. Once cleaned, a copy of the data and a record of the changes made will be forwarded by the Institute to the Commonwealth Department of Health and Ageing. A copy of the cleaned data for each jurisdiction should also be returned to that jurisdiction on request.

Periods for which data are collected and nationally collated

Quarterly and financial year. Extraction of data for each quarter or year should be based on the date of the end of the emergency department stay. For example, a presentation that commences at 11pm on 30 June and ends at 2am 1 July is not in scope for the April to June quarter.

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Comments: **Scope links with other metadata sets**

Episodes of care for admitted patients are reported through the Admitted patient care NMDS.

National Health Reform Agreement—National Partnership Agreement on Improving Public Hospital Services

The scope for reporting against the National Emergency Access Target is all hospitals reporting to the NAPEDC NMDS (Peer groups A, B and other) as at August 2011 (when the Agreement was signed). For the duration of the Agreement, hospitals that have not previously reported to the NAPEDC NMDS can come into scope, subject to agreement between the jurisdiction and the Commonwealth.

Outpatient care NMDS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 336862

Registration status: Health, Standard 04/07/2007

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of this National Minimum Data Set (NMDS) is for services provided to non-admitted, non-emergency department, patients registered for care by specialist outpatient clinics of public hospitals that are classified as either principal referral and specialist women's and children's hospitals and large hospitals (Peer Group A or B) as reported in the Australian Institute of Health and Welfare's Australian Hospital Statistics publication from the preceding financial year.

Hospitals use the term 'clinic' to describe various arrangements under which they deliver specialist outpatient services to non-admitted non-emergency department patients. **Outpatient clinic services** should be interpreted as encompassing services provided through specific organisational units staffed to administer and provide a certain range of outpatient care:

- in defined locations;
- at regular or irregular times; and
- where one or more specialist providers deliver care to booked patients.

Generally, in such clinics, a booking system is administered and patient records are maintained to document patient attendances and care provided.

The scope includes all arrangements made to deliver specialist care to non-admitted, non-emergency department patients whose treatment has been funded through the hospital, regardless of the source from which the hospital derives these funds. In particular, Department of Veterans' Affairs, compensable and other patients **funded through the hospital** (including Medicare ineligible patients) are included.

For the purposes of the Outpatient care NMDS, outreach services are counted at the specialist clinic where the patient is booked. Outreach services involve travel by the service provider, or services provided by a service provider via ICT (including but not limited to telephone and telehealth consultations). Such services may also be provided in the home, place of work or other non-hospital site.

Within the scope as defined, and subject to specific counting rules, occasions of service to be counted include outreach clinic services, services delivered in a multidisciplinary mode. A separate count of services delivered in group sessions is also collected.

Excluded from scope are:

- Outreach services which are not funded through the hospital and/or which deliver non- clinical care (activities such as home cleaning, meals on wheels, home maintenance); and
- All private specialist services delivered under private practice arrangements which are not funded through the hospital, regardless of whether or how these services may be funded by third party arrangements.
- All services covered by NMDS for:
  Admitted Patient Care,
  Admitted patient mental health care,
  Alcohol and other drug treatment services,
  Community mental health care,
  Non-admitted patient emergency department.

Admitted patient services are excluded from scope. However, outpatient services booked for reasons independent of, or distinct from the admitted patient episode are in scope.

Collection and usage attributes

Statistical unit: Occasions of service.

Group sessions.

Collection methods: **National reporting arrangements:**

State and territory Health authorities provide the data to the Department of Health and Ageing and Australian Institute of

Health and Welfare on an annual basis by 31 December each calendar year, for the previous financial year.

Periods for which data are collected and nationally collated:

Each financial year ending 30 June.

Perinatal NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 461787

Registration status: Health, Standard 07/03/2012

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of Perinatal national minimum data set (NMDS) is all births in Australia in hospitals, birth centres and the community. The data set includes information on all births, both live and stillborn, of at least 20 weeks gestation or 400 grams birth weight.

These data have two dimensions, which are the baby and the mother. All data relevant to the birth are conveyed in relation to one of these.

Collection and usage attributes

Collection methods: *National reporting arrangements*

State and territory health authorities provide the data to the Australian Institute of Health and Welfare's National Perinatal Epidemiology and Statistics Unit for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Public hospital establishments NMDS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 470656

Registration status: Health, Standard 07/12/2011

DSS type: National Minimum Data Set (NMDS)

Scope: The scope of the Public hospital establishments national minimum data set (NMDS) is establishment-level data for public acute and psychiatric hospitals, including hospitals operated for or by the Department of Veterans' Affairs, and alcohol and drug treatment centres.

Similar data for private hospitals and free standing day hospital facilities is collected by the Australian Bureau of Statistics in the Private Health Establishments Collection.

Hospitals operated by the Australian Defence Force, corrections authorities and Australia's external territories are not currently included. Hospitals specialising in dental, ophthalmic aids and other specialised acute medical or surgical care are included.

Collection and usage attributes

Statistical unit: Public hospital establishments.

Collection methods: Data are collected at each hospital from patient administrative and clinical record systems. Hospitals forward data to the relevant state or territory health authority on a regular basis (for example, monthly).

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Comments: *Scope links with other NMDSs*

Residential mental health care NMDS 2012-2013

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	468206
Registration status:	Health, Standard 07/03/2012
DSS type:	National Minimum Data Set (NMDS)
Scope:	Episodes of residential care for residents in all government-funded residential mental health care services in Australia, except those residential care services that are in receipt of funding under the Aged Care Act and subject to Commonwealth reporting requirements (i.e. report to the System for the payment of Aged Residential Care (SPARC) collection).

Collection and usage attributes

Statistical unit:

Episodes of residential care.

Statistical units are entities from or about which statistics are collected, or in respect of which statistics are compiled, tabulated or published.

Collection methods:

Data are collected at each service from resident administrative and care related record systems. Services forward data to the relevant state or territory health authority on a regular basis (e.g. monthly).

National reporting arrangements

State and territory health authorities provide the data to the Australian Institute of Health and Welfare for national collection, on an annual basis.

Government-operated services that employ mental health trained staff on-site 24 hours per day are to be included from 1 July 2004.

Government-funded, non-government operated services and non 24-hour staffed services can be included from 1 July 2004, optionally.

For non 24-hour staffed services to be included they must employ mental health-trained staff on-site at least 50 hours per week with at least 6 hours staffing on any single day.

Periods for which data are collected and nationally collated

	Financial years ending 30 June each year. The reference period starts on 1 July and ends on 30 June each year.
Implementation start date:	01/07/2012
Implementation end date:	30/06/2013
Comments:	Some admitted patient care services may meet the definition of a residential mental health service. However, as they are admitted patient care services, relevant data on their patients are reported to the National Minimum Data Set for Admitted Patient Care. *Glossary items* **Episode of residential care end** **Episode of residential care start** **Resident** **Residential mental health care service**

DSS

Acute coronary syndrome (clinical) DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 372930

Registration status: Health, Standard 01/10/2008

DSS type: Data Set Specification (DSS)

Scope: This Acute Coronary Syndrome (ACS) data set specification is not mandated for collection but is recommended as best practice if ACS data are to be collected. This data set specification enables individual hospitals or health service areas to develop collection methods and policies appropriate for their service.

The scope for the ACS data set specification is to collect data on the period between when a person with ACS symptoms was first referred to a hospital or directly presented at a hospital, and when a person leaves the hospital, either from the emergency department or is discharged from the hospital. Some of the data relevant to the management of patients attending hospital with ACS symptoms is specified for collection at follow-up visits with a specialist or as a non-admitted patient.

Acute coronary syndromes reflect the spectrum of coronary artery disease resulting in acute myocardial ischaemia, and span unstable angina, non-ST segment elevation myocardial infarction (NSTEMI) and ST-segment elevation myocardial infarction (STEMI). Clinically these diagnoses encompass a wide variation in risk, require complex and time urgent risk stratification and represent a large social and economic burden.

The definitions used in this data set specification are designed to underpin the data collected by health professionals in their day-to-day acute care practice. They relate to the realities of an acute clinical consultation for patients presenting with chest pain/ discomfort and the need to correctly identify, evaluate and manage patients at increased risk of a coronary event.

The data elements specified in this metadata set provide a framework for:

- promoting the delivery of evidenced-based acute coronary syndrome management care to patients;
- facilitating the ongoing improvement in the quality and safety of acute coronary syndrome management in acute care settings in Australia and New Zealand;
- improving the epidemiological and public health understanding of this syndrome; and
- supporting acute care services as they develop information systems to complement the above.

This is particularly important as the scientific evidence supporting the development of the data elements within the ACS data set specification indicate that accurate identification of the evolving myocardial infarction patient or the high/intermediate risk patient leading to the implementation of the appropriate management pathway impacts on the patient's outcome. Having a nationally recognised set of definitions in relation to defining a patient's diagnosis, risk status and outcomes is a prerequisite to achieving the above aims.

The ACS data set specification is based on the American College of Cardiology (ACC) Data Set for Acute Coronary Syndrome as published in the Journal of the American College of Cardiology in December 2001 (38:2114-30) as well as more recent scientific evidence around the diagnosis of myocardial infarction presented in the National Heart Foundation of Australia/Cardiac Society of Australia and New Zealand Guidelines for the management of acute coronary syndromes (MJA 2006;184;S1-S32). The data elements are alphabetically listed and grouped in a similar manner to the American College of Cardiology's data set format. These features of the Australian ACS data set should ensure that the data is internationally comparable.

Many of the data elements in this data set specification may also be used in the collection of other cardiovascular clinical information.

Where appropriate, it may be useful if the data definitions in this data set specification were also used to address data definition needs in non-clinical environments such as public health surveys etc. This could allow for qualitative comparisons between data collected in, and aggregated from, clinical settings (i.e. using application of the ACS data set specification), with that collected through other means (e.g. public health surveys, reports).

A set of ACS data elements and standardised definitions can inform the development and conduct of future registries at both the national and local level.

The working group formed under the National Heart Foundation of Australia (Heart Foundation) and the Cardiac Society of Australia and New Zealand (CSANZ) initiative was diverse and included representation from the following organisations: the Heart Foundation, the CSANZ, the Australasian College of Emergency Medicine, the Australian Institute of Health and Welfare, the Australasian Society of Cardiac & Thoracic Surgeons, Royal Australian College of Physicians (RACP), RACP - Towards a Safer Culture, National Centre for Classification in Health (Brisbane), the NSW Aboriginal Health & Medical Research Council, the George Institute for International Health, the School of Population Health at the University of Western Australia and the National Cardiovascular Monitoring System Advisory Committee.

To ensure the broad acceptance of the data set specification, the working group also sought consultation from the heads of cardiology departments, other specialist professional bodies and regional key opinion leaders in the field of acute coronary syndromes.

Collection and usage attributes

Guide for use:

There are six data clusters in the Acute Coronary Syndrome (Clinical) DSS. To ensure a complete description of the clinical management of acute coronary syndromes (ACS) it is recommended that all clusters be collected along with the individual data elements during the current ACS event by the individual hospital or health service area.

The six data clusters in this DSS include:

1. Acute coronary syndrome clinical event cluster
2.
3. Functional stress test cluster
4.

5. Electrocardiogram cluster
6.
7. Ventricular ejection fraction cluster
8.
9. Acute coronary syndrome pharmacotherapy cluster
10.
11. Coronary artery cluster

Collection methods: This data set specification is primarily concerned with the clinical use of ACS-Data. Acute care environments such as hospital emergency departments, coronary care units or similar acute care areas are the settings in which implementation of the core ACS data set specification should be considered. A wider range of health and health related establishments that create, use or maintain, records on health care clients, could also use it.

Metadata items in this Data Set Specification

Seq No.	*Metadata item*	*Obligation*	*Max occurs*

-	Date of triage	Optional	1
-	Date patient presents	Optional	1

-	Date troponin measured	Optional	1
-	Diabetes status	Conditional	1
-	Diabetes therapy type	Conditional	1
-	Dyslipidaemia treatment indicator	Conditional	1
-	Emergency department arrival mode - transport	Optional	1
-	Establishment identifier	Optional	1
-	Funding source for hospital patient	Optional	1
-	Glycosylated haemoglobin level (measured)	Optional	1
-	Glycosylated Haemoglobin—upper limit of normal range (percentage)	Conditional	1
-	Height (measured)	Conditional	1
-	Hypertension - treatment	Optional	1
-	Indigenous status	Optional	1
-	Instrumented bleeding location	Optional	1
-	Killip classification code	Optional	1
-	Lifestyle counselling type	Optional	1
-	Mode of separation	Optional	1
-	Non-instrumented bleeding location	Optional	1
-	Number of episodes of angina in last 24 hours	Conditional	1
-	Other/Underlying cause of acute coronary syndrome	Optional	1
-	Person identifier	Optional	1
-	Premature cardiovascular disease family history (status)	Optional	1
-	Principal diagnosis	Optional	1
-	Reason for readmission—acute coronary syndrome	Optional	1
-	Separation date	Optional	1
-	Sex	Optional	1
-	Time C-reactive protein level measured	Optional	1
-	Time creatine kinase MB isoenzyme measured	Conditional	1
-	Time of diagnostic cardiac catheterisation	Conditional	1
-	Time of implantable cardiac defibrillator procedure	Optional	1

-	Time of intra-aortic balloon pump procedure	Conditional	1
-	Time of non-invasive ventilation administration	Optional	1
-	Time of onset of acute coronary syndrome symptoms	Optional	1
-	Time of pacemaker insertion	Conditional	1
-	Time of triage	Optional	1
-	Time patient presents	Optional	1
-	Time troponin measured	Optional	1
-	Tobacco smoking status	Optional	1
-	Total blood units transfused	Conditional	1
-	Triage category	Conditional	1
-	Triglyceride level (measured)	Optional	1
-	Troponin assay type	Optional	1
-	Troponin assay—upper limit of normal range (micrograms per litre)	Conditional	1
-	Troponin level (measured)	Optional	1
-	Type of visit to emergency department	Optional	1
-	Underlying cause of death	Optional	1
-	Vascular history	Conditional	1
-	Weight in kilograms (measured)	Conditional	1

Breast cancer (Cancer registries) DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 370008

Registration status: Health, Standard 06/03/2009

DSS type: Data Set Specification (DSS)

Scope: This breast cancer data set is not mandated for collection but is recommended as best practice if breast cancer data are to be collected.

The data set would allow common, consistent and high quality breast cancer data to be collected by State and Territory cancer registries and collated nationally.

This data will help inform research, policy, planning and guideline development work in the breast cancer area.

Breast cancer may be used as a forerunner for other cancers in terms of establishing common data collections across cancer registries.

This data set includes 20 items, with the inclusion of five new standards and the addition of further detail to several existing standards.

Collection and usage attributes

Guide for use: Report each of the data elements in this data set once, and in no particular order.

Collection methods: State and Territory cancer registries collect data on incidence and annually report data to the Australian Institute of Health and Welfare.

Source and reference attributes

Submitting organisation: National Breast and Ovarian Cancer centre (NBOCC)

Australasian Association of Cancer Registries (AACR)

Australian Institute of Health and Welfare (AIHW)

Steward: Australasian Association of Cancer Registries (AACR)

Origin: National Breast and Ovarian Cancer centre (NBOCC)

Australasian Association of Cancer Registries (AACR)

Australian Institute of Health and Welfare (AIHW)

Cancer (clinical) DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 394731

Registration status: Health, Standard 07/12/2011

DSS type: Data Set Specification (DSS)

Scope: The purpose of the Cancer (clinical) data set specification (C(C)DSS) is to define data standards for the national collection of clinical cancer data so that data collected is consistent and reliable. Collection of this data set specification is not mandated but it is recommended as best practice if clinical cancer data are to be collected. It will facilitate more consistent data collection while enabling individual treatment centres or health service areas to develop data extraction and collection processes and policies that are appropriate for their service settings.

Mandatory reporting regulations have enabled population-based cancer registries in Australia to collect standard information on all incident cases of cancer apart from non-melanoma skin cancers, from which incidence, mortality and overall survival have been determined and trends monitored. The Cancer (clinical) data set specification provides a framework for the collection of more detailed and comprehensive clinical data such as stage of cancer at diagnosis, other prognostic characteristics, cancer treatment and patient outcomes.

The Cancer (clinical) data set specification will support prospective data collection from the time a person with cancer symptoms is referred or first presents to a hospital or specialist through the entire duration of their illness.

The majority of data items in the Cancer (clinical) data set specification are applicable to most solid tumours while many are also relevant to the haematopoietic malignancies such as leukaemia and lymphoma. Data set specifications for specialist tumour streams are also under development and these will contain supplementary data elements that will capture the special features of specific cancer types.

The definitions used in this data set specification are designed to capture the provision of cancer care on a day-to-day level. They relate to the cancer care pathway and the need to optimise care by correctly diagnosing, evaluating and managing patients with cancer. In addition, end-points and patterns of care can be monitored to understand both the appropriateness and effectiveness of cancer care.

The data elements specified provide a framework for:

- promoting the delivery of evidence-based care to patients with cancer
- facilitating the ongoing improvement in the quality and safety of cancer management in treatment settings
- improving the epidemiological and public health understanding of cancer
- informing treatment guidelines and professional education
- guiding resource planning and the evaluation of cancer control activities

They will facilitate the aggregation of data across different treatment centres.

The underlying long-term goal is to provide data support to improve outcomes for patients by increasing the quality and length of life. For example, a comparison of the actual management of patients with best practice guidelines may identify shortfalls in treatment and limitations in access to treatment modalities for some patients.

The working group formed under the stewardship of Cancer Australia was diverse and included representation from the following organisations: Cancer Australia, University of Sydney-Department of Gynaecological Oncology, Westmead Institute for Cancer Research, Cancer Council Victoria, Royal Brisbane & Women’s Hospital, National Breast and Ovarian Cancer Centre, The Royal Women’s Hospital, Queensland Health, Ministry of Health, NSW Health, TROG Cancer Research, and the Cancer Institute NSW.

To ensure the broad acceptance of the data set specification, the proposed list of data items was circulated to members of Cancer Australia’s National Cancer Data Strategy Advisory Group, a multidisciplinary group with a broad spectrum of epidemiological knowledge and expertise, and the inter-governmental Strategic Forum, comprising clinicians and senior health department officials from the Australian Government and from each state and territory government, and with strong community representation. The working group also sought consultation from cancer registry data managers, clinical leaders, pathologists, medical oncologists and radiation oncologists to achieve consensus when required.

Collection and usage attributes

Guide for use: The Cancer (clinical) data set specification contains six data clusters relating to cancer treatment. To ensure a complete description of the clinical management of cancer, it is recommended that if the patient has had the specific treatment modality the cluster refers to, each data item within the cluster should be completed.

The data clusters are as follows:

- Chemotherapy for cancer cluster
- Hormone therapy for cancer cluster
- Immunotherapy for cancer cluster
- Radiotherapy for cancer cluster
- Surgery for cancer cluster
- Systemic therapy procedure for cancer cluster

Collection methods: This data set is primarily directed at the clinical and clinical epidemiological use of cancer data. Treatment centres such as hospitals, radiotherapy centres and cancer specialist practices are the settings in which implementation of the core Cancer (clinical) data set specification should be considered. The data set specification can also be used by a wider range of health and health-related establishments that create, use, or maintain records on health-care clients.

Cardiovascular disease (clinical) DSS

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	374213
Registration status:	Health, Standard 22/12/2009
DSS type:	Data Set Specification (DSS)

Scope:

The collection of cardiovascular data (CV-Data) in this metadata set is voluntary.

The definitions used in CV-Data are designed to underpin the data collected by health professionals in their day-to-day practice. They relate to the realities of a clinical consultation and the ongoing nature of care and relationships that are formed between doctors and patients in clinical practice.

The data elements specified in this metadata set provide a framework for:

- promoting the delivery of high quality cardiovascular disease preventive and management care to patients,
- facilitating ongoing improvement in the quality of cardiovascular and chronic disease care predominantly in primary care and other community settings in Australia, and
- supporting general practice and other primary care services as they develop information systems to complement the above.

This is particularly important as general practice is the setting in which chronic disease prevention and management predominantly takes place. Having a nationally recognised set of definitions in relation to defining a patient's cardiovascular behavioural, social and biological risk factors, and their prevention and management status for use in these clinical settings, is a prerequisite to achieving these aims.

Many of the data elements in this metadata set are also used in the collection of diabetes clinical information.

Where appropriate, it may be useful if the data definitions in this metadata set were used to address data definition needs for use in non-clinical environments such as public health surveys etc. This could allow for qualitative comparisons between data collected in, and aggregated from clinical settings (i.e. using application of CV-Data), with that collected through other means (e.g. public health surveys).

Collection and usage attributes

Collection methods: This metadata set is primarily concerned with the clinical use of CV-data. It could also be used by a wider range of health and health related establishments that create, use or maintain records on health care clients.

Computer Assisted Telephone Interview demographic module DSS

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	374218
Registration status:	Health, Standard 03/12/2008
DSS type:	Data Set Specification (DSS)
Scope:	Key demographic set for use in Computer Assisted Telephone Interviewing (CATI) health surveys. It is intended to be used by anyone conducting population health surveys using the CATI mode, such as State/Territory government health agencies. This data set is to standardise demographic collection in all CATI surveys of health topics, such as CATI asthma and CATI diabetes surveys. The standardisation of the collection of health survey data is a major focus of the National Public Health Partnership (NPHP) work plan. The CATI demographic module DSS is not mandated for collection but recommended as best practice.

Collection and usage attributes

Collection methods:	Population health surveys conducted by CATI

Source and reference attributes

Submitting organisation:	National Public Health Information Working Group.

Relational attributes

Diabetes (clinical) DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 304865

Registration status: Health, Standard 21/09/2005

DSS type: Data Set Specification (DSS)

Scope: The use of this standard is voluntary.

However, if data is to be collected the Diabetes (clinical) Data Set Specification (DSS) aims to ensure national consistency in relation to defining, monitoring and recording information on patients diagnosed with diabetes.

The Diabetes (clinical) DSS relates to the clinical status of, the provision of services for, and the quality of care delivered to individuals with diabetes, across all health care settings including:

- General Practitioners;
- Divisions of General Practice;
- Diabetes Centres
- Specialists in private practice; and
- Community Health Nurses and Diabetes Educators.

The Diabetes (clinical) DSS:

- provides concise, unambiguous definitions for items/conditions related to diabetes quality care, and
- aims to ensure standardised methodology of data collection in Australia.

The expectation is that collection of this data set facilitates good quality of care, contributes to preventive care and has the potential to enhance self-management by patients with diabetes.

The underlying goal is improvement of the length and quality of life of patients with diabetes, and prevention or delay in the development of diabetes related complications.

Collection and usage attributes

Collection methods: This metadata set is primarily concerned with the clinical use of Diabetes data. It could/should be used by health and health related establishments that create, use or maintain records on health care clients.

One methodology is for data to be collected over a 1-month

	period of all diabetes patients presenting at sites participating in the collection. The information is de-identified to protect the privacy of individuals. The participation is voluntary. An individual benchmarking report is provided. The results provide a snapshot of care of people with diabetes.
Comments:	Statistical units are entities from or about which statistics are collected or in respect of which statistics are compiled, tabulated or published. **Scope links with other Metadata sets** Cardiovascular disease (clinical) DSS.

Functioning and Disability DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 320319

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

DSS type: Data Set Specification (DSS)

Scope: The Functioning and Disability DSS aims to ensure national consistency in relation to defining and measuring human functioning and disability. This DSS has been developed to be consistent with the International Classification of Functioning, Disability and Health (ICF).

Functioning and disability are dual concepts in a broad framework.

Functioning is the umbrella term for any or all of: body functions, body structures, activities and participation. Functioning is a multidimensional concept denoting the neutral aspects of the interaction between an individual (with a health condition) and that individual's environmental and personal factors.

Disability is the umbrella term for any or all of: an impairment of body structure or function, a limitation in activities, or a restriction in participation. Disability is a multi-dimensional and complex concept and is conceived as a dynamic interaction between health conditions and environmental and personal factors (WHO 2001:6).

A health condition may be a disease (acute or chronic), disorder, injury or trauma. Environmental factors make up the physical, social and attitudinal environment in which people live and conduct their lives. Personal factors relate to the individual, such as age, sex and Indigenous status.

The components of functioning and disability are classified and defined in the ICF as **body structures** and **body functions**, **activities** and **participation** and **environmental factors**. Each component is composed of various domains; these are sets of related physiological functions, anatomical structures, actions, tasks, areas of life, and external influences. Qualifiers, the numeric measures coded after the relevant domain, are usually essential to the meaningful use of the classification because of the neutral terms of the domains.

Many different 'definitions' of disability are used in Australia, both in administrative data collections and in Acts of Parliament. The consistent identification of disability in national data collections has been recommended in a number of reports, for instance to enable:

- the monitoring of access to generic services by people with disability;
- the collection of more consistent data on disability support and related services, including data on service use by different groups;
- population data and service data to be related, thereby improving the nation's analytical capacity in relation to the need for and supply of services; and
- improved understanding of the relationship between disability, health conditions and other health outcomes.

Defining disability makes it possible to determine the number of people in the population with disability, those who are accessing services, both disability specific and generic, and those with a disability in the general population with unmet need. Better definition of disability will aid better targeting of resources to those in need.

The concept 'Disability' can be operationalised in a wide variety of settings and for various purposes, using a combination of related metadata items as building blocks.

The metadata items selected for a particular application may vary depending on the approach to functioning and disability. For example, in hospital rehabilitation, the focus may be on the impairment and activity dimensions, and in community-based care the focus may be primarily on participation. Some applications may require a broad scope for inclusion (e.g. discrimination legislation). Data collections relating to services will select combinations of the data elements, which best reflect the eligibility criteria for the service.

The Functioning and Disability DSS comprises the following four clusters to describe level of human functioning:

12. Body functioning, qualified by extent of impairment
13. Body structure, qualified by extent, nature and location of impairment
14. Activities and participation, qualified by level of difficulty and need for assistance with undertaking activities and extent of and satisfaction with participation
15. Environmental factors, qualified by extent of influence of the environment

Data collected using this DSS can be related to national data collections which use ICF concepts such as the Commonwealth

State Territory Disability Agreement (CSTDA) NMDS collection and the ABS Survey of Ageing, Disability and Carers and, from 2006, the Census.

Collection and usage attributes

Collection methods:

Each of the four clusters that make up the Functioning and Disability DSS should be recorded for a complete description of human functioning. This information can be gathered over time by a range of health and community care providers.

Completion of the DSS will record a person-centred description of the experience of functioning of the individual who is the subject of the data. The experience of functioning is in relation to a health condition, and does not consider decrements in functioning that may be associated with social factors such as ethnic background or economic status. For example, the level of communication is recorded in relation to the heath condition, not to the fact that a person does not speak English at home.

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an umbrella term for 'disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as:

- Episode of care principal diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N]}
- Episode of care additional diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}.

This DSS may be used in data collections in the community services, housing and health sectors.

Comments:

The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002). The ICF is grounded in a human rights philosophy, and its relationship to the UN Standard Rules on Equalization of Opportunities for Persons with Disabilities endorsed by the United Nations in 1994 is acknowledged. The purpose of the Rules is to ensure that people with disabilities, as members of their societies, may exercise the same rights and obligations as others.

Health care client identification DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 374201

Registration status: Health, Standard 03/12/2008

DSS type: Data Set Specification (DSS)

Scope: The data elements specified in this metadata set provide a framework for improving the positive identification of persons in health care organisations. This metadata set applies in respect of all potential or actual clients of the Australian health care system. It defines demographic and other identifying data elements suited to capture and use for person identification in health care settings.

The objectives in collecting the data elements in this metadata set are to promote uniformly good practice in:

- identifying individuals
- recording identifying data so as to ensure that each individual's health records will be associated with that individual and no other.

The process of positively identifying people within a health care service delivery context entails matching data supplied by those individuals against data the service provider holds about them. The positive and unique identification of health care clients is a critical event in health service delivery, with direct implications for the safety and quality of health care.

There are many barriers to successfully identifying individuals in health care settings, including variable data quality; differing data capture requirements and mechanisms; and varying data matching methods. These definitions provide a base for improving the confidence of health service providers and clients alike that the data being associated with any given individual, and upon which clinical decisions are made, is appropriately associated.

Collection and usage attributes

Collection methods: This metadata set is primarily concerned with the clinical use of Health care client identification data. It should be used by health and health-related establishments that create, use or maintain records on health care clients.

Establishments should use this metadata set, where appropriate, for collecting data when registering health care clients or potential health care clients.

The collection of data based on this metadata set is voluntary.

National reporting arrangements

Collectors of this metadata set should refer to relevant privacy legislation, codes of fair information practice and other guidelines so as not to breach personal privacy in their collection, use, storage and disclosure of health care client information. There is no comprehensive privacy legislation covering both the public and private sectors across Australia so users need to consider their particular set of circumstances (i.e. location and sector) and whether privacy legislation covers those circumstances.

A Commonwealth legislative scheme applies to the private sector. Users may refer to the Federal Privacy Commissioner's web site for assistance in complying with their privacy obligations. In the public sector, in instances where no legislation, code of fair information practice or other guidelines covers the particular circumstances, users should refer to AS 4400 Personal privacy protection in health care information systems.

Health care provider identification DSS

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	374199
Registration status:	Health, Standard 03/12/2008
DSS type:	Data Set Specification (DSS)

Scope:

The scope of these data elements includes identification of individual and organisation health care providers. The data elements also allow for identification of an individual in a health care organisation. The definition of health care provider is:

'any person or organisation who is involved in or associated with the delivery of healthcare to a client, or caring for client wellbeing'.

The data elements have been defined to enable a common, best practice approach to the way data are captured and stored, to ensure that records relating to a provider will be associated with that individual and/or organisation and no other. The definitions are proposed for clinical and administrative data management purposes.

The ability to positively identify health care providers and locate their relevant details is an important support to the provision of speedy, safe, high quality, comprehensive and efficient health care. Unambiguous identification of individual health care providers is necessary for:

- Requesting and reporting of orders, tests and results (e.g. pathology, diagnostic imaging)
- Other communications and referrals between health care providers regarding ongoing care of patients (e.g. a referral from a GP to a specialist, a hospital discharge plan)
- Reporting on health care provision to statutory authorities (e.g. reporting of hospital patient administration systems data to State/Territory government health agencies)
- Payments to providers
- Registration of providers
- Directories or lists of providers and their service locations for consumer information.

Collection and usage attributes

Collection methods: Collected at point of entry to health care for the purposes of the identification of the provider of that health care.

Comments: There are many barriers to successfully identifying individuals in health care settings, including variable data quality; differing data capture requirements and mechanisms; and varying data matching methods. This data set specification provides a framework for improving the confidence that the data being associated with any given individual or organisation, is appropriately associated.

Source and reference attributes

Submitting organisation: Standards Australia Inc Health Informatics Committee (IT-014)

Reference documents: Health care client identification DSS

The Australian Standard AS4846 Health Care Provider Identification identifies other data that should be collected. These data are collections of free text information and as such are not capable of standardisation as a national health data standard. Within AS4846 however they form part of the data collection necessary for the complete identification of a heath care provider.

These data elements are identified in the section Standardised elsewhere section below.

If these data elements are collected in conjunction with those of the Data set specification they form a collection equivalent to that of the Australian Standard AS4846.

Indigenous primary health care DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 430629

Registration status: Health, Standard 07/12/2011

DSS type: Data Set Specification (DSS)

Scope: The Indigenous primary health care data set specification (IPHC DSS) is primarily designed to support the collection of aggregate information from Indigenous-specific primary health care services. The IPHC DSS describes the aggregate data to be reported by those Indigenous-specific primary health care services. Only the data, which services aggregate using cohort definitions and specialised software, will be supplied through the OATSIH Community Health Reporting Environment (OCHRE), a web-based reporting tool. No individual level client data will be supplied to either the Australian Institute of Health and Welfare (AIHW) or the Department of Health and Ageing (DoHA).

For the purposes of the IPHC DSS, Aboriginal and Torres Strait Islander primary health care is defined as:

"…socially and culturally appropriate, universally accessible, scientifically sound, first level care. It is provided by health services and systems with a suitably trained workforce comprised of multidisciplinary teams supported by integrated referral systems in a way that: gives priority to those most in need and addresses health inequalities; maximises community and individual self-reliance, participation and control and; involves collaboration and partnership with other sectors to promote public health. Comprehensive primary health care includes health promotion, illness prevention, treatment, and care of the sick, community development, advocacy, and rehabilitation services."

This definition has been endorsed by the Aboriginal Medical Services Alliance of the Northern Territory (AMSANT), the Australian General Practice Network (AGPN), the Australian Primary Health Care Research Institute (APHCRI), and the Australian Medical Association (AMA).

Aboriginal and Torres Strait Islander primary health care services include:

1. Aboriginal Community Controlled Health Service (ACCHS): primary health care services initiated and operated by the local Aboriginal community to deliver holistic, comprehensive, and culturally appropriate health care to the community which controls it (through a locally elected Board of Management); and

2. Other Aboriginal and Torres Strait Islander primary health care services: health services funded principally to provide services to Aboriginal and Torres Strait Islander individuals with funding provided by the federal and/or state or territory governments. These non community-controlled services mainly exist in the Northern Territory and northern part of Queensland.

Services use a clinical audit tool program for extracting and aggregating data from their patient information and recall systems. The IPHC DSS has been written to inform this program. Once aggregated, the data will be sent to the AIHW via the OATSIH Community Health Reporting Environment (OCHRE), a web-based reporting tool with an ‘in-confidence’ security classification.

The IPHC DSS includes aggregate data only; it does not include data elements describing any details relating to or arising from individual client visits, at the client visit level, e.g. blood pressure measurements, body mass index (BMI) values and so on.

Aggregate data will initially be collected from a limited number of primary health care services, i.e. those funded by the Office for Aboriginal and Torres Strait Islander Health (OATSIH) via the Healthy for Life program. From mid-2012, data collection will be extended to the remainder of services funded by OATSIH to deliver primary health care. From mid-2013, data collection will be expanded to also include state- and territory-funded Indigenous-specific primary health care services not funded by OATSIH.

Collection and usage attributes

Statistical unit:

Each unit represents aggregated data from an individual Indigenous-specific primary health care service.

Collection methods:

The IPHC DSS describes only the aggregated data. Patient Information Referral Systems (PIRS) contain many variables related to individual clients. The Clinical Audit Tool (CAT) is programmed to extract variables determined in data elements and counting how many clients have these variables. Services will then authorise transmission of these de-individualised data extracted by CAT to AIHW through the OCHRE web-based tool.

The regular client status of a client will be determined by the service on the PIRS and will need to be reviewed on a twice-yearly basis.

National reporting arrangements

Each service funded to provide Indigenous-specific primary health care should record service provision in clinical information management systems that allow the electronic transmission of data for reporting.

Periods for which data are collected and nationally collated

Data collections and data reporting will be on a 6-monthly basis.

Medical indemnity DSS

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	329638
Registration status:	Health, Standard 07/12/2011
DSS type:	Data Set Specification (DSS)

Scope:

The Medical indemnity data set specification (DSS) describes the data items and standardised data outputs for medical indemnity claims for the Medical Indemnity National Collection (MINC).

The MINC contains information on medical indemnity claims against health providers. These are claims for compensation for harm or other loss allegedly due to the delivery of health care. This health care may occur in settings such as hospitals, outpatient clinics, general practitioner surgeries, community health centres, residential aged care or mental health care establishments or during the delivery of ambulatory care. Adverse events or harm due to medical treatment, which do not result in a medical indemnity claim, are not included in the MINC.

In 2002, Australia's Health Ministers decided that a 'national database for medical negligence claims' should be established. In 2003 the Medical Indemnity Data Working Group (MIDWG) came into existence with its membership drawn from health authorities, the Department of Health and Ageing and the Australian Institute of Health and Welfare (AIHW). The MIDWG collaborated on establishing a Medical Indemnity National Collection (Public Sector), comprising data from the jurisdictions. In 2006 private medical indemnity insurers agreed to have their data on medical indemnity claims included in the MINC. In 2008 the Australian Health Ministers' Advisory Council approved funding for data development work. The data items and recording specifications proposed for DSS development are based on those endorsed by the MIDWG for the 2009-10 data transmission period.

Medical indemnity claims fit into two categories, i.e. actual claims (on which legal activity has commenced via a letter of demand, the issue of a writ or a court proceeding) and potential claims (where the health authority or private medical indemnity insurer has placed a reserve against a health-care incident in the expectation that it may eventuate to an actual medical indemnity claim). Information in the MINC relates to actual and potential medical indemnity claims and the alleged or reported health-care incidents leading to medical indemnity claims.

The MINC includes basic demographic information on the patient at the centre of the alleged health-care incident; related information such as the type of incident or allegation and the clinical specialties involved; the reserve amount set against the likely cost of settling the medical indemnity claim; the time between setting the reserve and closing the medical indemnity claim; and the cost of closing the medical indemnity claim and the nature of any compensatory payments.

Compensatory payments may be made to the patient and/or to an other party claiming collateral loss as a result of the loss or harm experienced by the patient.

As a general guide, the main steps in the management of public sector medical indemnity claims are:

1. An incident that could lead to a medical indemnity claim is notified to the relevant claims management body. In some jurisdictions medical indemnity claims are managed by the relevant state or territory health authority; however, in others, most of the claims management process is handled by a body external to the health authority. Occasionally, some of the legal work may be outsourced to private law firms.

2. If the likelihood of a medical indemnity claim eventuating is considered sufficiently high, a reserve is placed, based on an estimate of the likely cost of the claim when closed.

3. Various events can signal the start of a medical indemnity claim, for example, a writ or letter of demand may be issued by the claimant's solicitor (this can occur before an incident has been notified) or the defendant may make an offer to the claimant to settle the matter before a writ or letter has been issued. In some cases no action is taken by the claimant or the defendant.

4. The medical indemnity claim is investigated. This can involve liaising with clinical risk management staff within the health facility concerned and seeking expert medical advice.

5. As the medical indemnity claim progresses the reserve is monitored and adjusted if necessary.

6. A medical indemnity claim is closed when, in the opinion of the health authority, there will be no future unforeseen costs associated with the claim's investigation, litigation or a payment to a claimant. If a claim is closed and the possibility of future costs arises, the claim may be reopened.

7. A medical indemnity claim may be finalised through several processes—through state/territory-based complaints processes, court-based alternative dispute resolution processes, or in

court. In some jurisdictions settlement via statutorily mandated conference processes must be attempted before a medical indemnity claim can go to court. In some cases settlement is agreed between claimant and defendant, independent of any formal process. A medical indemnity claim file that has remained inactive for a long time may be finalised through discontinuation.

The detail of this process varies between jurisdictions, and in some jurisdictions there are different processes for small and large medical indemnity claims. Private medical indemnity insurers follow a similar process in managing claims reported to them that are covered by the insurance they provide to private medical practitioners.

Collection and usage attributes

Guide for use: The following terminology is used in the Medical indemnity DSS:

- Claim refers to a medical indemnity claim
- Claimant could be another party/parties alleging loss due to the incident, rather than or in addition to the patient.

Collection methods: State and territory health authorities provide data on medical indemnity claims to the AIHW for national collation, annually. Data is for the financial year ending 30 June. Private medical indemnity insurers provide data on the same annual basis for a subset of the data items provided by public sector health authorities.

Comments: The Medical indemnity DSS has been developed by the AIHW in conjunction with the MIDWG.

Non-admitted patient DSS 2012-13

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 471846

Registration status: Health, Standard 07/12/2011

DSS type: Data Set Specification (DSS)

Scope: The scope of this data set specification (DSS)(Phase 1) is outpatient clinic service events involving non-admitted patients at public hospitals classified as either principal referral, and specialist women's and children's hospitals or large hospitals (Peer Group A or B) as reported in the Australian Institute of Health and Welfare's Australian Hospital Statistics publication of 2008-09.

The Non-admitted patient (NAP) DSS is intended to capture instances of service provision from the point of view of the patient.

For the purpose of this DSS, an outpatient clinic is a specialty unit or organisational arrangement under which a hospital provides outpatient clinic services. The nature of the service provided by the clinic is classified by 'clinic type'. All outpatient clinic types are included in the DSS, except specialised mental health and alcohol and other drug treatment services which are included in separate NMDSs noted below.

The scope includes:

- **All arrangements made to deliver outpatient clinic service events** (not covered by the NMDSs listed below) to non-admitted patients:

  whose treatment has been funded through the hospital, regardless of the source from which the hospital derives these funds. In particular, Department of Veterans' Affairs, compensable and other patients funded through the hospital (including Medicare ineligible patients) are included; and

  regardless of setting or mode

Excluded from scope in Phase 1 are:

- **All services covered by NMDS for:**

  Admitted patient care,

  Admitted patient mental health care,

  Alcohol and other drug treatment services,

  Community mental health care,

Non-admitted patient emergency department care, e.g. all outpatient clinic services provided to admitted patients are excluded;

- **All outpatient service events delivered by private specialist services** under private practice arrangements;
- **Service events** funded by the hospital but **delivered by another entity** (including community health service, NGOs and private hospitals);
- **Service events which deliver non-clinical care** (activities such as home cleaning, meals on wheels, home maintenance);
- **Diagnostic imaging, pathology, pharmacy and other ancillary services** whether they are **associated with an outpatient clinic service event** or **provided independently** of an outpatient clinic service event.

Collection and usage attributes

Statistical unit: Non-admitted patient service event

Collection methods: All characteristics are reported for each service event as at the time of the service event.

Implementation start date: 01/07/2012

Implementation end date: 30/06/2013

Source and reference attributes

Submitting organisation: NAP NMDS (Phase 1) working group

Palliative care performance indicators DSS

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	295806
Registration status:	Health, Standard 05/12/2007
DSS type:	Data Set Specification (DSS)

Scope:

This data set specification specifies information for collection about all administrative health regions, and whether they have developed strategic plans which incorporate specified palliative care elements. It also specifies information for collection about all government-funded **palliative care agencies** (service provider organisations), their approach to some aspects of service delivery, and their efforts in specific areas of quality improvement.

This information enables reporting of nationally-agreed palliative care performance indicators. Currently, there are four national performance indicators that have been agreed for reporting by the Palliative Care Intergovernmental Forum. These are:

1. The proportion of administrative health regions that have a written plan for palliative care that incorporates palliative care elements,

2. The proportion of palliative care agencies, within their setting of care, that routinely undertake or undergo formal assessment against the Palliative Care Australia standards,

3. The proportion of palliative care agencies, within their setting of care, that actively collect feedback from clients and staff (within the workforce) relating to services and service delivery,

4. The proportion of palliative care agencies, within their setting of care, that have formal working partnerships with other services provider(s) or organisation(s).

Collection and usage attributes

Collection methods:

The data for this DSS are obtained from two sources: a survey of administrative health regions and a survey of all government-funded palliative care agencies (service provider organisations) that provide care in community and/or admitted patient settings.

Perinatal DSS 2012-2013

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 473035

Registration status: Health, Standard 07/03/2012

DSS type: Data Set Specification (DSS)

Scope: The scope of the Perinatal data set specification (DSS) is all births in Australia in hospitals, birth centres and the community. The data set includes information on all births, both live and stillborn, of at least 20 weeks gestation or 400 grams birth weight.

These data have two dimensions, which are the baby and the mother. All data relevant to the birth are conveyed in relation to one of these.

Collection and usage attributes

Guide for use: This data set specification is intended as an interim standard only, in that it should only be used for as long as:

16. the optional data element Female—number of antenatal care visits, total N[N] is not able to be reported by all jurisdictions, and
17. the optional data element Person—area of usual residence, geographical location code (ASGC 2011) NNNNN is reported by those jurisdictions that wish to do so.

If jurisdictions are capable of reporting the Number of antenatal care visits data element in their perinatal data from 1 July 2012 then they should do so. It is expected that this data element will become reportable for all jurisdictions from 1 July 2013, in which case it will be included as a mandatory data element in the Perinatal national minimum data set (NMDS) for 2013-2014.

Jurisdictions should only report the ASGC-based geographical location data element if they have a legitimate need to geocode their perinatal data in accordance with both ASGC 2011 and ASGS 2011. It is expected that this data element will be reported by a small number of jurisdictions for the 2012-2013 year only. From 2013-2014 onwards, geographical reporting should be based solely on the ASGS.

Collection methods: *National reporting arrangements*

State and territory health authorities provide the data to the Australian Institute of Health and Welfare's National Perinatal

Epidemiology and Statistics Unit for national collation, on an annual basis.

Periods for which data are collected and nationally collated

Financial years ending 30 June each year.

Prison clinic contact DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 396072

Registration status: Health, Standard 25/08/2011

DSS type: Data Set Specification (DSS)

Scope: The Prison clinic contact DSS describes data on the visits by prisoners to the prison clinic during the National Prisoner Health Census reporting period.

Collection and usage attributes

Statistical unit: The two statistical units in this data set specification are the Health Service Event and the Person.

In this data set specification person refers to the prisoner attending the prison clinic.

Guide for use: This DSS is a component of the Prisoner health DSS. The Prisoner health DSS describes data about public and private prisons operating in Australia. It includes data on prison entrants, prisoners who visit a prison clinic or take repeat medication while in custody, prison clinic services and prison clinic staffing levels.

In this DSS, a 'visit' is defined as a face-to-face consultation for which an entry is made in the health service record (other than for routine household-type treatments such as band-aids or paracetemol).

Collection methods: Information on clinic visits is provided by the treating health professional at the clinic using the Prisoners in Custody—Clinic Visits form. One form is to be completed for each clinic contact.

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	395955
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Set Specification (DSS)
Scope:	The Prison entrants DSS describes data about all persons aged 18 years and over entering prison system during the National Prisoner Health Census reporting period.

Collection and usage attributes

Guide for use:

This DSS is a component of the Prisoner health DSS. The Prison entrants DSS describes data about people entering the prison system during the National Prisoner Health Census reporting period. This includes demographic data and data about a prison entrant's mental health, chronic disease status, their use of alcohol and other drugs, their use of health services and pregnancy.

Collection methods:

Information about the prison entrant is collected by a health professional at the prison reception health assessment (alternatively known as the intake or induction assessment) using the Prison Entrants form.

One Prison Entrants form should be completed for each person who enters the prison system during the National Prisoner Health Census reporting period.

Prisoner health DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 375978

Registration status: Health, Standard 25/08/2011

DSS type: Data Set Specification (DSS)

Scope: The Prisoner health data set specification (DSS) describes data collected from all public and private prisons throughout Australia on prison entrants, prisoners who visit a prison clinic, prisoners who are taking repeat medication while in custody, prison clinic services and staffing levels. The data are used to report against the National Prisoner Health Indicators, assist in monitoring the health of prisoners and inform prisoner health service planning and delivery.

In this collection, public and private prisons include those administered by Corrective Services departments, including correctional facilities and remand centres. Excluded from the collection are periodic detention centres, court and police cells, juvenile detention centres, immigration detention centres, secure psychiatric facilities, military prisons, and home detention programs.

The Prisoner health DSS contains four component data set specifications:

Prison entrants DSS: describes data on all prisoners entering prison in the National Prisoner Health Census period. This includes demographics, mental health, chronic diseases, alcohol and other drug use, use of health services and pregnancy.

Prison clinic contact DSS: describes data from all visits by prisoners to the prison clinic during the National Prisoner Health Census period regarding the number of clinic contacts each prisoner made and the reason for clinic attendance.

Prisoners in custody repeat medications DSS: describes data on the category of repeat medications administered to prisoners on one day during the National Prisoner Health Census period.

Prison establishments DSS: describes data provided by prison clinic management regarding the services provided by prison clinics.

Collection and usage attributes

Statistical unit: Prisoner and Prison Entrant

Collection methods: The National Prisoner Health Census consists of the following four questionnaires which are used to obtain data on prison entrants, prisoners who visit the prison clinic, use of repeat medications and prison establishments:

- Prison Entrants form
- Prisoners in Custody—Clinic Visits form
- Prisoners in Custody—Repeat Medications form
- Prison Establishment form.

Prisoners in custody repeat medications DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 396074

Registration status: Health, Standard 25/08/2011

DSS type: Data Set Specification (DSS)

Scope: The Prisoners in custody repeat medications DSS describes data regarding all instances of prisoners in custody taking repeat medication.

Collection and usage attributes

Guide for use: This DSS is a component of the Prisoner health DSS. The Prisoner health DSS describes data about public and private prisons operating in Australia. It includes data on prison entrants, prisoners who visit a prison clinic or take repeat medication while in custody, prison clinic services and prison clinic staffing levels.

This DSS includes all prescribed medications administered on one day during the National Prisoner Health Census period and depot medications i.e. medications injected so absorption occurs over a prolonged period, whether or not they were administered on the census day. Routine household-type medications, such as paracetamol, taken on an as-needed basis are not included.

Collection methods: Information on all repeat medications administered to prisoners on a designated day in the National Prisoner Health Census reporting period is recorded on the Prisoners in Custody—Repeat Medications form by the treating health professional at the clinic visit. More than one medication category may be recorded.

Public hospital establishment address details DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 471194

Registration status: Health, Standard 07/12/2011

DSS type: Data Set Specification (DSS)

Scope: The Public hospital establishment address details data set specification (DSS) is used to collect information pertaining to the address of the hospital establishments reported in the Public hospital establishments NMDS.

The mandatory fields to be reported for address are:

- Establishment—organisation identifier (Australian), NNX[X]NNNNN
- Address—road number 1, road number X[6]
- Address—road name, text X[45]
- Address—road type, code AA[AA]
- Address—suburb/town/locality name, text X[46]
- Address—Australian postcode, code (Postcode datafile) {NNNN}
- Address—Australian state/territory identifier, code AA[A]

All other data elements are to be reported if that data element is a component of the address of the Public hospital establishment.

Radiotherapy waiting times DSS 2012-

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 447921

Registration status: Health, Standard 07/12/2011

DSS type: Data Set Specification (DSS)

Scope: The main purpose of the Radiotherapy waiting times data set specification (RWT DSS) is to describe the information that must be collected to calculate the waiting times for two time periods in the treatment pathway for radiotherapy services in Australia:

18.
19. The time between the date a patient's first referral is received at a particular establishment by a radiation oncologist to the date of that patient's first consultation at that establishment with a radiation oncologist; and
20.
21. The time between the patient's ready-for-care date and the date of the first megavoltage external beam radiotherapy treatment.

Establishments in scope are only those healthcare establishments that provide megavoltage external beam radiotherapy treatment (in-scope radiotherapy treatment). Both public and private establishments are in scope. It is desirable for both public establishments and private establishments to report data to the DDS.

The scope is not limited by diagnosis: it includes people with cancer (notifiable and non-notifiable) and people who do not have cancer.

People in scope are those who, within the reference period:

- had a first consultation at a particular establishment with a radiation oncologist, but did not start a course of radiotherapy treatment (regardless of whether treatment was prescribed) (consult only—related to wait time period 1 above); or
- had a first consultation at a particular establishment with a radiation oncologist and started a course of radiotherapy treatment (consult + treatment—related to wait time periods 1 and 2 above); or
- started a course of radiotherapy treatment but whose first consultation at that establishment with a radiation

oncologist was in a previous reference period (treatment only—related to wait time 2 above).

For public establishments, all in-scope activity should be reported, including services provided by specialists operating under right of private practice arrangements.

Collection and usage attributes

Statistical unit:

22. First consultations at an establishment with a radiation oncologist;
23. Courses of radiotherapy treatment started.

Guide for use:

The table below defines some key concepts used in the Radiotherapy waiting times DSS. It is assumed that data submitted to the Radiotherapy waiting times DSS adhere to these definitions. These definitions do not necessarily apply to other data sets.

Key concept	Definition
Course of radiotherapy treatment	A course of radiotherapy treatment is a series of one or more radiotherapy treatments prescribed by a radiation oncologist. A course of radiotherapy treatment should have an associated ready-for-care date and, when treatment starts, a radiotherapy start date. A patient can receive more than one course of radiotherapy treatment at the same time (i.e. courses which are simultaneous or which overlap). These courses may have the same or different ready-for-care dates and the same or different radiotherapy start dates. Only a radiation oncologist can prescribe a course of radiotherapy treatment. A prescription is not equal to a course of radiotherapy treatment. A prescription may be for one or more courses of radiotherapy treatment. A prescription outlines the anatomical region/sites to be treated and is for a prescribed dose at a defined volume (fractionation) over a defined period of time. One course of radiotherapy treatment may cover multiple phases and multiple

	treatment plans. The completion of a course of radiotherapy treatment is not relevant to the definition of a course of radiotherapy treatment.
Diagnosis	Diagnosis may be described either by the principal diagnosis and primary site of cancer (where radiotherapy is intended as treatment for cancer), or by the prinicipal diagnosis of the disease being treated (where radiotherapy is intended as treatment for a disease other than cancer).
Treatment start	Treatment starts with the first fraction delivered and does not include the planning or simulation stages of radiotherapy.

The statistical unit will be calculated by the AIHW for time periods 1 and 2 (see Scope above) using the following data elements:

For waiting period 1, AIHW will calculate the time in days between 'Health service event—service request received date, DDMMYYYY' and 'Health service event—first service contact date, DDMMYYYY'.

For waiting period 2, AIHW will calculate the time in days between 'Patient—ready-for-care date, DDMMYYYY' and 'Patient—radiotherapy start date, DDMMYYYY'.

Implementation start date: 01/07/2012

Registered chiropractic labour force DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 384097

Registration status: Health, Standard 10/12/2009

DSS type: Data Set Specification (DSS)

Scope: All chiropractors listed with the Australian Health Practitioner Regulation Agency during the reference period. Chiropractors included in this DSS may be currently registered or they may be listed but not currently registered.

Collection and usage attributes

Statistical unit: The statistical unit for this data set is the Registered chiropractor.

A Registered chiropractor refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a chiropractor at any time during the reference period.

Guide for use: This DSS is a component of the Registered health labour force DSS. The Registered health labour force DSS contains profession-specific DSS for health professions listed with the Australian Health Practitioner Regulation Agency

Note that a health professional may be qualified and registered in more than one profession.

Within each profession-specific DSS there are data clusters that apply to health professionals employed in the profession. Main job data clusters apply to all health professionals employed in the profession. Second job data clusters relate only to those health professionals employed in more than one job in the profession. All other workforce data elements in the DSS apply to all jobs held in the profession.

Collection methods: *National reporting arrangements*

Registered health professionals provide data to the Australian Health Practitioner Regulation Agency as part of their initial registration and registration renewal processes. The data includes information required for registration purposes and additional workforce data.

The Australian Health Practitioner Regulation Agency provides an extract of these data to the Australian Institute of Health and Welfare (AIHW) for the purposes of national collation and reporting. The data in this DSS comprises demographic, registration and work characteristics information.

Periods for which data are collected and collated

Data are collated annually. The period is determined by the national registration renewal period for chiropractors.

Collection of workforce data

Health professionals are asked to report data for their main job, second job, and all jobs in the profession. Some health professionals may hold more than two jobs in the profession therefore data reported for main and second jobs may be less than data reported for all jobs in the profession.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: For further information regarding the national registration scheme for health professionals, please see the Australian Health Practitioner Regulation Agency website at http://www.ahpra.gov.au

Registered health labour force DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 380533

Registration status: Health, Standard 10/12/2009

DSS type: Data Set Specification (DSS)

Scope: All health professionals listed with the Australian Health Practitioner Regulation Agency (AHPRA) during the reference period. This encompasses health professions that require registration under the National Registration and Accreditation Scheme and includes, but is not limited to:

- chiropractic
- dentistry
- dental hygiene
- dental prosthetics
- dental therapy
- medicine
- midwifery
- nursing (enrolled, registered, practitioner)
- optometry
- osteopathy
- pharmacy
- physiotherapy
- podiatry
- psychology

This DSS includes health professionals who are currently registered with AHPRA and health professionals who are no longer registered but remain listed with AHPRA.

Collection and usage attributes

Statistical unit: The statistical unit for this data set is the Registered health professional.

A Registered health professional refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency at any time during the reference period.

Guide for use:

This DSS comprises a set of DSS for health professions covered by the Australian Health Practitioner Regulation Agency. It includes:

- Registered chiropractic labour force DSS
- Registered dental and allied dental labour force DSS
- Registered medical labour force DSS
- Registered midwifery labour force DSS
- Registered nursing labour force DSS
- Registered optometry labour force DSS
- Registered osteopathy labour force DSS
- Registered pharmacy labour force DSS
- Registered physiotherapy labour force DSS
- Registered podiatry labour force DSS
- Registered psychology labour force DSS

Note that a health professional may be qualified and registered in more than one profession.

The Registered health labour force DSS provides comprehensive data on Australia's registered health labour force. It assists governments, educators, health care providers and the community to understand the current health labour force and with workforce planning.

Collection methods:

National reporting arrangements

Registered health professionals provide data to the Australian Health Practitioner Regulation Agency as part of their initial registration and registration renewal processes. The data includes information required for registration purposes and additional workforce data.

The Australian Health Practitioner Regulation Agency provides an extract of these data to the Australian Institute of Health and Welfare (AIHW) for the purposes of national collation and reporting. The data in this DSS primarily comprises workforce data.

Periods for which data are collected and collated

Data are collated annually for each profession. The period is determined by the national registration renewal period for health professionals and may differ between health professions.

Registered pharmacy labour force DSS

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 384152

Registration status: Health, Standard 10/12/2009

DSS type: Data Set Specification (DSS)

Scope: All pharmacists listed with the Australian Health Practitioner Regulation Agency during the reference period. Pharmacists included in this DSS may be currently registered or they may be listed but not currently registered.

Collection and usage attributes

Statistical unit: The statistical unit for this data set is the Registered pharmacist.

A Registered pharmacist refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a pharmacist at any time during the reference period.

Guide for use: This DSS is a component of the Registered health labour force DSS. The Registered health labour force DSS contains profession-specific DSS for health professions listed with the Australian Health Practitioner Regulation Agency.

Note that a health professional may be qualified and registered in more than one profession.

Within each profession-specific DSS there are data clusters that apply to health professionals employed in the profession. Main job data clusters apply to all health professionals employed in the profession. Second job data clusters relate only to those health professionals employed in more than one job in the profession. All other workforce data elements in the DSS apply to all jobs held in the profession.

Collection methods: *National reporting arrangements*

Registered health professionals provide data to the Australian Health Practitioner Regulation Agency as part of their initial registration and registration renewal processes. The data includes information required for registration purposes and additional workforce data.

The Australian Health Practitioner Regulation Agency provides an extract of these data to the Australian Institute of Health and Welfare (AIHW) for the purposes of national collation and reporting. The data in this DSS comprises demographic, registration and work characteristics information.

Periods for which data are collected and collated

Data are collated annually. The period is determined by the national registration renewal period for pharmacists.

Collection of workforce data

Health professionals are asked to report data for their main job, second job, and all jobs in the profession. Some health professionals may hold more than two jobs in the profession therefore data reported for main and second jobs may be less than data reported for all jobs in the profession.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: For further information regarding the national registration scheme for health professionals, please see the Australian Health Practitioner Regulation Agency website at http://www.ahpra.gov.au

Cluster

Activities and Participation cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 320111

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

DSS type: Data Element Cluster

Scope: This data cluster is one of four clusters that make up the Functioning and Disability DSS. To ensure a complete description of human functioning it is recommended that this cluster be collected along with the following three clusters over time and by a range of health and community care providers:

24. Body functions cluster
25. Body structures cluster
26. Environmental factors cluster

In the context of health, activity refers to the execution of a task or action by an individual, and participation refers to involvement in a life situation.

The Activities and Participation cluster collects information on a person's level of difficulty with activities, assistance needed to perform activities, extent of participation, and satisfaction with participation in the following life areas:

27. Learning and applying knowledge
28. General tasks and demands
29. Communication
30. Mobility
31. Self-care
32. Domestic life
33. Interpersonal interactions and relationships
34. Major life areas
35. Community, social and civic life

The use of this cluster to collect information on activity limitations and participation restrictions should enhance data quality for medical purposes as well as for a range of purposes related to understanding human functioning. This data cluster should be complementary to information on diseases.

The information collected in the Activities and Participation cluster may also indicate the sorts of interventions that could result in improved functioning. This could be in the form of rehabilitation, health-related interventions, equipment, or support for example.

Collection and usage attributes

Guide for use:

The following four measures are used to describe activities and participation in life areas:

36. **Difficulty** with activities may include pain involved, time taken, effort, number of errors, clumsiness, and modification of the manner in which the activity is performed. Difficulty is the combination of the frequency with which the problem exists, the duration of the problem and the intensity of the problem.
37. **Need for assistance** with activities includes personal assistance and/or supervision.
38. **Extent of participation** indicates the level of participation restriction. This corresponds to an externally observable measure of participation.
39. **Satisfaction with participation** corresponds to the person's own perspective on their participation, and reflects their attitude to their participation in the various life areas. It is essentially a summary measure in which are embedded the concepts of choice, opportunity and importance.

For each life area code recorded there can be one response for each of the measures. The choice of measure will depend on the user and their information requirements.

There are numerous possible methods for collecting activity, activity limitation, participation and participation restriction. A decision could be made to collect information:

- about every domain;
- on domains of particular relevance; or
- on a number of domains which are prioritised according to specified criteria.

See also the *ICF Australian User Guide* for further guidelines.

Collection methods:

The Person—activities/participation life area, code (ICF 2001) AN[NNN] data element is supported by a value domain - Activities and participation code (ICF 2001) AN[NNN] - representing a single list of activity and participation domains that are grouped together.

The World Health Organization suggests the list be used in one of four operational ways.

a) To designate some domains as activities and others as participation, not allowing any overlap.

b) Same as (a) above, but allowing partial overlap.

c) To designate all detailed domains as activities and the broad category headings as participation.

d) To use all domains as both activities and participation.

The ICF Australian User Guide proposes the use of either option (b) or (d) with the use of additional qualifiers to delineate between activity and participation.

The Person—activities and participation life area, code (ICF 2001) AN[NNN] data element can be used on its own as a neutral list of tasks, actions and life situations, or together with the four additional data elements in this cluster to record positive or neutral performance as well as activity limitations and participation restrictions. (It is important to note that the Person—activities and participation life area, code (ICF 2001) AN[NNN] data element must always be used when recording any of the other four data elements.)

Comments:

This cluster is based on the International Classification of Functioning, Disability and Health (ICF). The ICF is a reference member of the WHO Family of International Classifications (endorsed by the World Health Assembly in 2001) and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an ‘umbrella term for disease (acute or chronic), disorder, injury or trauma’ (WHO 2001). A health condition may be recorded, for example, as:

- Episode of care principal diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}
- Episode of care additional diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}.

The ICF recognises two constructs that can be used with 'Activities and Participation': performance and capacity. 'Performance' is what the person does in their usual environment. 'Capacity' describes 'an individual's ability to execute a task or an action in a standardised environment, where a standardised environment may be:

- an actual environment commonly used for assessment in test settings; or
- in cases where this is not possible, an assumed environment which can be thought to have a uniform impact' (WHO 2001).

The standardised environment has not been generally operationalised. However, the recognition of these two constructs in the ICF underscores the importance of recording the environment in which activities are being performed.

Acute coronary syndrome clinical event cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	352671
Registration status:	Health, Standard 01/10/2008
DSS type:	Data Element Cluster
Scope:	The acute coronary syndrome (ACS) related clinical events are those which can negatively impact on the outcomes of a person with ACS. Information on the occurrence of these events in people with ACS is required due to an emerging appreciation of their relationship with late mortality. The clinical event cluster collects information on the timing and type of clinical events experienced during the current hospitalisation.

Acute coronary syndrome pharmacotherapy data cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	351876
Registration status:	Health, Standard 01/10/2008
DSS type:	Data Element Cluster

Scope:

The pharmacotherapies collected in this data cluster are recommended for the management of acute coronary syndromes (ACS) in the national guidelines. The following pharmacotherapies are collected as part of this data cluster:

- Aspirin
- Angiotensin converting enzyme (ACE) inhibitor
- Angiotensin II receptor blocker
- Antithrombin
- Beta-blocker
- Clopidogrel
- Fibrinolytic
- Glycoprotein IIb/IIIa receptor antagonist
- Statin

The pharmacotherapy cluster collects information on the type of pharmacotherapies prescribed and the timing of each prescription.

AUDIT score of risky alcohol consumption cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 403067

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: This data cluster is used to provide a score on the World Health Organization's Alcohol Use Disorders Identification Test (AUDIT) screening instrument. The data elements in this cluster relate to alcohol use in the last 12 months only. The AUDIT is a reliable and simple screening tool which is sensitive to the early detection of risky and high-risk (or hazardous and harmful) drinking.

Collection and usage attributes

Guide for use: The AUDIT score of risky alcohol consumption cluster comprises three data elements which record the frequency of alcohol consumption, the number of standard drinks consumed on a typical day when drinking and the frequency of consuming six or more standard drinks on one occasion.

The combination of codes for the three data elements: *Person—alcohol consumption amount (self-reported), total standard drinks NN*; *Person—alcohol consumption frequency, AUDIT alcohol consumption frequency code N*; and *Person—consumption of 6 or more standard drinks on one occasion, AUDIT consumption of 6 or more standard drinks code N* are used to provide a score on the AUDIT.

Responses to each question on the AUDIT are scored from 0 to 4, with a maximum possible score over the three questions being 12. A score of 6 or more on the AUDIT may indicate a risk of alcohol-related harm.

The formula for calculating a standard drink is:

Volume of container in litres x % alcohol by volume (ml/100ml) X 0.789*= The number of standard drinks. For example:

285ml full strength beer (4.9% alcohol)   1 standard drink

425ml light beer (2.9% alcohol)	1 standard drink
375ml stubby or can (4.9% alcohol)	1.4 standard drinks
425ml full strength beer (4.9% alcohol)	1.6 standard drinks
30 ml spirits (40% alcohol)	1 standard drink
150ml wine (12% alcohol)	1.5 standard drinks

* The specific gravity of ethyl alcohol is 0.789.

Collection methods:

The AUDIT contains the following questions:

Over the last 12 months:

a) How often did you have a drink containing alcohol?

0 Never

1 Monthly or less

2 2-4 times a month

3 2-3 times a week

4 4 or more times a week

b) How many standard drinks would you have on a typical day when you were drinking?

0 1 or 2

1 3 or 4

2 5 or 6

3 7 to 9

4 10 or more

c) How often did you have six or more standard drinks on one occasion?

0 Never

1 Less than monthly

	2 Monthly
	3 Weekly
	4 Daily or almost daily
	If the person's response to '(a) How often did you have a drink containing alcohol' is Never, do not ask questions (b) and (c). The person should only record one answer to each question.

3	Frequency consumed 6 or more standard drinks on one occasion	Conditional	1

Body functions cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 320117

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

DSS type: Data Element Cluster

Scope: This data cluster is one of four clusters that make up the Functioning and Disability DSS. To ensure a complete description of human functioning it is recommended that it be collected along with the following three clusters over time and by a range of health and community care providers:

40. Body Structures cluster
41. Activities and Participation cluster
42. Environmental factors cluster

Body functions are the physiological functions of body systems (including psychological functions). The term ‘body’ refers to the human organism as a whole; hence it includes the brain and its functions, that is, the mind.

The Body functions cluster collects information on the presence and extent of impairment of the eight body function domains listed below:

43. Mental functions
44. Sensory functions and pain
45. Voice and speech functions
46. Functions of the cardiovascular, haematological, immunological and respiratory systems
47. Functions of the digestive, metabolic and the endocrine system
48. Genitourinary and reproductive functions
49. Neuromusculoskeletal and movement-related functions
50. Functions of the skin and related structures

Impairments of body functions, as defined in the ICF, are problems in body functions such as a loss or significant departure from population standards or averages. The ICD uses impairment as ‘signs and symptoms’, a ‘component of disease’ or sometimes ‘reason for contact with health services’.

Impairments are recorded in terms of their extent or magnitude, nature and/or location. Determination of impairment is undertaken primarily by those qualified to evaluate physical and mental functioning or structure according to these standards.

Impairments should be detectable or noticeable by others or the person by direct observation or by inference from indirect observation. Impairments are not the same as the underlying pathology, but are manifestations of that pathology.

Impairments can be temporary or permanent; progressive, regressive or static; intermittent or continuous. The deviation from the population norm may be slight or severe and may fluctuate over time. Impairments may result in other impairments.

Impairments may be part, or an expression of a health condition, but do not necessarily indicate that a disease is present or that the individual should be regarded as sick.

The use of this cluster to collect information on impairments of body functions should enhance data quality for medical purposes as well as for a range of purposes related to human functioning. This data cluster should be complementary to information on diseases.

The information collected in the Body functions cluster may also indicate the sorts of interventions that could result in improved functioning. This could be in the form of rehabilitation, health-related interventions, equipment, or support for example.

Collection and usage attributes

Collection methods:

The Person—body function, code (ICF 2001) AN[NNNN] data element is a neutral list of functions that can be used to record positive or neutral body function, as well as impairment of a specified body function when used in conjunction with Person—extent of impairment of body function, code (ICF 2001)N. For each body function code recorded there should be a code for impairment of body functions.

There are numerous possible methods for collecting body functions and impairments. A decision could be made to collect information:

- about every domain;
- on domains of particular relevance; or
- on a number of domains which are prioritised according to specified criteria.

See also the *ICF Australian User Guide* for further guidelines.

Comments: This cluster is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as:

- Episode of care principal diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}
- Episode of care additional diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}.

Body structures cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 320151

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

DSS type: Data Element Cluster

Scope: This data cluster is one of four clusters that make up the Functioning and Disability DSS. To ensure a complete description of human functioning it is recommended that this cluster be collected along with the following three clusters over time and by a range of health and community care providers:

51. Body functions cluster
52. Activities and participation cluster
53. Environmental factors cluster

Body structures are anatomical parts of the body such as organs, limbs and their components.

The Body structures cluster collects information on the presence and extent of impairment, the nature of the change and the location of the impairment for the eight body structure domains listed below:

54. Structures of the nervous system
55. The eye, ear and related structures
56. Structures involved in voice and speech
57. Structures of the cardiovascular, immunological and respiratory systems
58. Structures related to the digestive, metabolism and endocrine systems
59. Structures related to genitourinary and reproductive systems
60. Structures related to movement
61. Skin and related structures

Impairments of body structures, as defined in the ICF, are problems in body structure such as a loss or significant departure from population standards or averages. The ICD uses impairment as ‘signs and symptoms’, a ‘component of disease’ or sometimes ‘reason for contact with health services’.

Impairments are recorded in terms of their extent or magnitude, nature and/or location. Determination of impairment is undertaken primarily by those qualified to evaluate physical and mental functioning or structure according to population standards or averages.

Impairments should be detectable or noticeable by others or the person by direct observation or by inference from indirect observation. Impairments are not the same as the underlying pathology, but are manifestations of that pathology.

Impairments can be temporary or permanent; progressive, regressive or static; intermittent or continuous. The deviation from the population norm may be slight or severe and may fluctuate over time. Impairments may result in other impairments.

Impairments may be part, or an expression of a health condition, but do not necessarily indicate that a disease is present or that the individual should be regarded as sick.

The use of this cluster to collect information on impairments should enhance data quality for medical purposes as well as for a range of purposes related to understanding human functioning. This data cluster should be complementary to information on diseases.

The information collected in the Body structures cluster may also indicate the sorts of interventions that could result in improved functioning. This could be in the form of rehabilitation, health-related interventions, equipment, or support for example.

Collection and usage attributes

Guide for use:

The Person—body structure, code (ICF 2001) AN[NNNN] is a data element supported by the value domain Body structure code (ICF 2001) AN(NNNN) that represents a neutral list of structures from the ICF. This data element can be used to record positive or neutral body structure, as well as impairment of a specified body structure when used in conjunction with Person—extent of impairment of body structure, code (ICF 2001) N.

It is optional to record the location and nature of the impairment using Person—nature of impairment of body structure, code (ICF 2001) X and Person—location of impairment of body structure, code (ICF

2001) X respectively.

There are numerous possible methods for collecting body structures and impairments. A decision could be made to collect information:

- about every domain;
- on domains of particular relevance; or
- on a number of domains which are prioritised according to specified criteria.

Comments:

This cluster is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as:

- Episode of care principal diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N]}
- Episode of care additional diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N]}

Chemotherapy for cancer cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	418323
Registration status:	Health, Standard 07/12/2011
DSS type:	Data Element Cluster

Scope:

Chemotherapy is cancer treatment that achieves its antitumour effect through the use of antineoplastic drugs that inhibit the reproduction of cancer cells by interfering with DNA synthesis and mitosis.

The chemotherapy cluster consists of those data elements recommended for collection as best practice when the patient is administered chemotherapy as part of the initial course of treatment for cancer. The chemotherapy cluster collects information on the chemotherapy agent or protocol, the number of cycles administered and the start and finish dates of treatment.

Information on the agent and number of cycles of chemotherapy treatment is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the start and finish dates will enable an estimate of the duration of chemotherapy and the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities, potentially improving outcomes for patients.

Collection and usage attributes

Guide for use:

Capturing chemotherapy agents and cycles can be problematic. Chemotherapy agents are administered in treatment cycles, either singly or in a combination regimen or protocol of two or more chemotherapy drugs. Treatment may be administered prior to surgery or radiotherapy to reduce the tumour burden (neoadjuvant), concurrent with radiotherapy, following surgery or radiotherapy (adjuvant) or on its own. Regimens may be complex involving many drugs given at different times during the initial course of treatment. In addition, if a patient has an adverse reaction, one of the agents in a combination regimen may be changed.

Furthermore, chemotherapy regimens are often expressed as acronyms identifying the agents used in combination. However, the letters used are not consistent across regimens, and in some cases (for example, "BEACOPP") the same letter is used to represent two different treatments. Finally, treatment protocols may be specific to the treatment centre.

Standard protocols are available online at eviQ Cancer Treatments Online (www.eviQ.org.au). This website is powered by the Cancer Institute NSW and endorsed by Cancer Australia, and provides current, evidence based, best practice cancer treatment protocols and information. It is recommended that only regimen or protocol names listed in eviQ be used to record chemotherapy agents; in all other cases, record the full generic name of each individual chemotherapy agent for each course of treatment.

Collection methods: Chemotherapy agents and cycles are recorded for each course of chemotherapy administered during the initial course of treatment regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment/cycle. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic mode/course of treatment/cycle.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The start date and completion date of chemotherapy are recorded once only for chemotherapy administered during the initial course of treatment.

This information should be collected from the patient's medical record.

Chronic condition cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 399234

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction to determine:

- the number of prison entrants who have ever been told that they have either arthritis, asthma, cancer, cardiovascular disease or diabetes; and
- the number of prison entrants who currently have at least one of the above listed chronic conditions.

Collection and usage attributes

Guide for use: The Chronic condition cluster comprises three data elements which allow:

1. Data on the type of chronic condition to be combined with an indicator of whether the prison entrant has ever been told by a doctor or nurse that he or she has the condition. This is achieved by the combination of the two data elements: *Person—type of chronic condition, code N* and *Person—specific chronic condition indicator, yes/no code N*.

2. Data on the type of chronic condition to be matched with an indicator of whether the person reports that they currently have the condition. This is achieved by the combination of the two data elements: *Person—type of chronic condition, code N* and *Person—chronic condition indicator, yes/no code N.*

This combination of the three data elements as shown above allows the following two items to be recorded:

- the type of chronic condition the prison entrant reports ever having been told they have, and
- whether the prison entrant reports that they currently have the chronic condition.

The Chronic condition cluster describes the following information:

Type of chronic condition	Specific chronic condition indicator	Chronic condition indicator
Arthritis	Yes	Yes/No
	No	N/A
Asthma	Yes	Yes/No
	No	N/A
Cancer	Yes	Yes/No
	No	N/A
Cardiovascular disease	Yes	Yes/No
	No	N/A
Diabetes	Yes	Yes/No
	No	N/A

N/A is not applicable

Collection methods: Information on chronic conditions is collected at the reception assessment on the National Prisoner Health Census Prison Entrants form.

Coronary artery cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 352651

Registration status: Health, Standard 01/10/2008

DSS type: Data Element Cluster

Scope: This cluster collects information on the characteristics of and interventions performed for the coronary arteries during the current hospitalisation. The coronary arteries included in this cluster are:

- Left anterior descending coronary artery
- Inferior surface artery
- Left circumflex coronary artery
- Diagonal coronary artery
- Left main coronary artery
- Posterior descending artery
- Right coronary artery

Collection and usage attributes

Collection methods: When reporting the maximum stenosis in the coronary arteries, reporting of all the following coronary vessels is mandatory:

- Diagonal coronary artery
- Left anterior descending coronary artery
- Inferior surface artery
- Left circumflex coronary artery
- Left main coronary artery
- Posterior descending artery
- Right coronary artery

Elective surgery waiting times cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 464669

Registration status: Health, Standard 07/12/2011

DSS type: Data Element Cluster

Scope: The scope of the Elective surgery waiting times data element cluster is patients on elective surgery waiting lists managed by public acute hospitals, in either category 1 or 2 of the 'Reason for removals from elective surgery waiting list' data element.

This will include private patients treated in public hospitals, and may include public patients treated in private hospitals.

Hospitals may also collect information for other care (as defined in the 'Waiting list category' data element), but this is not part of the national minimum data set (NMDS) for Elective surgery waiting times.

Patients on waiting lists managed by hospitals operated by the Australian Defence Force, corrections authorities and Australia's external territories are not currently included.

Collection and usage attributes

Guide for use: Outsourced or contracted patients

Public hospitals managing elective surgery waiting lists may either outsource elective surgery work to another hospital (public or private) or contract another hospital (public or private) to provide elective surgery on their behalf.

In such cases, the hospital where the outsourced or contracted elective surgery occurs is required to include the *'Establishment—organisation identifier (Australian), NNX[X]NNNNN'* data element for the hospital managing the elective surgery waiting list as part of the Elective surgery waiting times data cluster.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

-	Electrocardiogram change type	Conditional	99
-	Heart rhythm type	Mandatory	99
-	Time of electrocardiogram	Mandatory	99

Environmental factors cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 320195

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

DSS type: Data Element Cluster

Scope: This data cluster is one of four clusters that make up the Functioning and Disability DSS. To ensure a complete description of human functioning it is recommended that this cluster be collected along with the following three clusters over time and by a range of health and community care providers:

62. Body functions cluster
63. Body structures cluster
64. Activities and participation cluster

Environmental factors make up the physical, social and attitudinal environment in which people live and conduct their lives. These factors can have a positive or negative influence on a person's participation as a member of society, on performance of activities, or on a person's body function or structure.

The Environmental Factors cluster collects information on the extent to which each of the domains in the five chapters listed below influence the body function or structure, activity or participation of a person:

65. Products and technology
66. Natural environment and human-made changes to environment
67. Support and relationships
68. Attitudes
69. Services, systems and policies

Each chapter contains categories at different levels ordered from general to detailed. For detailed information the user should follow the structure of the ICF; the codes should be drawn from the same hierarchical level within any particular chapter.

Codes at the ICF chapter headings may be recorded. If further detail is required the Environmental

Factors classification includes 3 and 4 digit codes:

e5 Services, systems and policies

e580 Health services, systems and policies

e5800 Health services

Where multiple environmental factors and the extent of influence are recorded, the following prioritising system may be useful:

- The first recorded environmental factor is the one having the greatest impact on the individual.
- Second and subsequent environmental factors are also of relevance to the individual.

The Environmental factors cluster may be used in health, community services and other disability-related data collections to record the environmental factors that facilitate or inhibit optimum functioning at the body, person or societal level. Identifying whether, and by how much, these environmental factors are influencing an individual’s level of functioning, and whether the influence is a facilitator or barrier, may indicate the sorts of interventions that will optimise the individual’s functioning. This information may be useful for policy development, service provision, or advocacy purposes. Preventative strategies could also be indicated by this information.

Collection and usage attributes

Guide for use:

For each environmental factor code recorded there should be one response for the influence of the environmental factor.

There are numerous possible methods for collecting environmental factors. Information can be collected on:

- all environmental factors;
- environmental factors of particular relevance;
- a number of environmental factors, prioritised according to specified criteria;
- one environmental factor per person; or
- record environmental factors for each recorded body function, body structure, and activities and participation.

See also the *ICF Australian User Guide* for further guidelines.

Comments: This cluster is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as:

- Episode of care principal diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}
- Episode of care additional diagnosis, code (ICD-10-AM 5th Ed) ANN{.N[N}.

Full-time equivalent prison staff cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	413709
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to determine the number of full-time equivalent health staff working within a prison.

Collection and usage attributes

Guide for use:

The Full-time equivalent prison staff cluster comprises two data elements: *Establishment (prison)—number of full-time equivalent staff, total number N[N]* and *Establishment (prison)—health worker type, occupation code (ANZSCO 1st edition) N[NNN]{NN}* that describe the number of full-time equivalent health staff working within a prison.

The Full-time equivalent prison staff cluster describes the following information:

Type of health staff	Number
Medical practitioner	N[N]
Psychologists	N[N]
Dental practitioner	N[N]
Psychiatrist	N[N]
Registered nurse	N[N]
Enrolled nurse	N[N]
Aboriginal and Torres Strait Islander health worker	N[N]

Registration status:	Health, Standard 01/04/2009
DSS type:	Data Element Cluster
Scope:	The scope of this data cluster is direct government and government-funded expenditure by a health industry relevant organisation consisting mainly of purchases of goods and services. These are all either health and health–related goods and services or non-health care goods and services to support the health industry relevant organisation's activities.

Collection and usage attributes

Guide for use:	Expenses are to be reported in millions to the nearest 100,000 e.g. $4.1 million.
Collection methods:	This data is collected according to the organisation's main activity types and type of health or health related function relevant to each State and Territory. This is supplied by the GHE and specified in the reporting guidelines as provided by the AIHW.

Relational attributes

Health service non-utilisation cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 412707

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction with each other to describe the non-utilisation of health services in the community and in prison by prison entrants in the last 12 months; and to gain a greater understanding of the health seeking behaviours of prison entrants.

Collection and usage attributes

Guide for use: The Health service non-utilisation cluster comprises three data elements that provide information on a prison entrant's health seeking behaviours in the community and prison. This is achieved by the combination of the three data elements: *Prison entrant—service provider needed but not utilised indicator, yes/no code N*; *Prison entrant—type of service provider needed but not utilised, occupation code (ANZSCO 1st edition) N[NNN]{NN}* and *Health service event—prisoner location when service provider was needed, but not utilised, prisoner location code N*.

The Health service non-utilisation cluster describes the following information:

Health service provider not consulted	Location of prisoner: Community	Location of prisoner: Prison
Medical practitioner (Doctor/GP)	Y/N	Y/N
Nurse	Y/N	Y/N
Psychologist	Y/N	Y/N
Psychiatrist	Y/N	Y/N
Aboriginal and Torres Strait Islander health	Y/N	Y/N

worker		
Drug and alcohol counsellor	Y/N	Y/N
Dentist	Y/N	Y/N
Social worker/welfare officer	Y/N	Y/N

Collection methods: Information on health service non-utilisation is provided at the reception assessment on the National Prisoner Health Census Prison Entrants form. Only prison entrants who have been in prison in the last 12 months may provide responses to the 'Prison' category.

Health service utilisation cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	402411
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to describe the utilisation of health services in the community and in prison by prison entrants in the last 12 months; and to gain a greater understanding of the health seeking behaviours of prison entrants.

Collection and usage attributes

Guide for use:

The Health service utilisation cluster comprises three data elements that provide information on a prison entrant's health seeking behaviours in the community and prison. This is achieved by the combination of the three data elements: *Prison entrant—individual service provider consulted indicator, yes/no code N*, *Prison entrant—type of service provider consulted, occupation code (ANZSCO 1st edition) N[NNN]{NN}* and *Health service event—prisoner location, code N.*

The Health service utilisation cluster describes the following information:

Health service provider consulted	Location of prisoner: Community	Location of prisoner: Prison
Medical practitioner (Doctor/GP)	Y/N	Y/N
Nurse	Y/N	Y/N
Drug and alcohol counsellor	Y/N	Y/N
Aboriginal and Torres Strait Islander Health Worker	Y/N	Y/N
Dental practitioner	Y/N	Y/N

Psychologist	Y/N	Y/N
Psychiatrist	Y/N	Y/N
Social worker/welfare officer	Y/N	Y/N

Collection methods: Information on health service utilisation is provided at the reception assessment on the National Prisoner Health Census Prison Entrants form. Only prison entrants who have been in prison in the last 12 months may provide responses to the ‘Prison’ category.

Hormone therapy for cancer cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 418349

Registration status: Health, Standard 07/12/2011

DSS type: Data Element Cluster

Scope: Hormone therapy is cancer treatment that achieves its antitumour effect through changes in hormonal balance. It includes the administration of hormones, agents acting via hormonal mechanisms, antihormones and steroids.

The hormone therapy cluster consists of those data elements recommended for collection as best practice when the patient is administered hormone therapy as part of the initial course of treatment for cancer. The hormone therapy cluster collects information on the hormone therapy agent or protocol and the start and finish dates of treatment.

Information on the hormone therapy agent is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the start and finish dates will enable an estimate of the duration of hormone therapy and the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities, potentially improving outcomes for patients.

Collection and usage attributes

Guide for use: Standard protocols are available online at eviQ Cancer Treatments Online (www.eviQ.org.au). This website is powered by the Cancer Institute NSW and endorsed by Cancer Australia, and provides current, evidence based, best practice cancer treatment protocols and information. It is recommended that only regimen or protocol names listed in eviQ be used to record hormone therapy agents; in all other cases, record the full generic name of each individual hormone therapy agent for each course of treatment.

Collection methods:

Hormone therapy agents are recorded for each course of hormone therapy administered during the initial course of treatment regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment/cycle. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic mode/course of treatment/cycle.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The start date and completion date of hormone therapy are recorded once only for hormone therapy administered during the initial course of treatment.

This information should be collected from the patient's medical record.

Hospital transfer cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	412990
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to describe the number of planned and unplanned transfers between prison and a community-based hospital during the National Prisoner Health Census period.

Collection and usage attributes

Guide for use:

The Hospital transfer cluster comprises two data elements that allow data on the number and type (planned/unplanned) of transfers between prison and a community-based hospital during the National Prisoner Health Census period to be determined.

This is achieved by the combination of the two data elements: *Establishment (prison)—planned hospital transfer indicator, yes/no code N* and *Establishment (prison)—number of hospital transfers, number N[NN].*

Immunotherapy for cancer cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 418352

Registration status: Health, Standard 07/12/2011

DSS type: Data Element Cluster

Scope: Immunotherapy, also known as biological therapy, biotherapy or biological response modifier therapy, is cancer treatment that achieves its antitumour effect by altering the immune system or changing the host's response to the tumour cells.

The immunotherapy cluster consists of those data elements recommended for collection as best practice when the patient is administered immunotherapy as part of the initial course of treatment for cancer. The immunotherapy cluster collects information on the immunotherapy agent or protocol and the start and finish dates of treatment.

Information on the immunotherapy agent is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the start and finish dates will enable an estimate of the duration of immunotherapy and the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities; potentially improving outcomes for patients.

Collection and usage attributes

Guide for use: Standard protocols are available online at eviQ Cancer Treatments Online (www.eviQ.org.au). This website is powered by the Cancer Institute NSW and endorsed by Cancer Australia, and provides current, evidence based, best practice cancer treatment protocols and information. It is recommended that only regimen or protocol names listed in eviQ be used to record immunotherapy agents; in all other cases, record the full generic name of each individual immunotherapy agent for each course of treatment.

Collection methods:

Immunotherapy agents and cycles are recorded for each course of immunotherapy administered during the initial course of treatment regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment/cycle. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic mode/course of treatment/cycle.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

The start date and completion date of immunotherapy are recorded once only for immunotherapy administered during the initial course of treatment.

This information should be collected from the patient's medical record.

Incarceration history cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 398973

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction with each other to provide information on a prison entrant's incarceration history.

Collection and usage attributes

Guide for use: The Incarceration history cluster provides information on the total number of times a prison entrant has been in custody in a **juvenile detention centre** or a prison. This is achieved by the combination of the two data elements: *Prison entrant—type of corrective services facility, code N,* and *Prison entrant—number of times in prison or juvenile detention.*

The Incarceration history cluster describes data on:

	Juvenile detention centre	Adult prison
Number of times in custody	N[N]	N[N]

As this data cluster aims to collect the prison entrant's previous history of incarceration, both items may be applicable to the one prisoner. That is, a prisoner may have previously been detained in both a juvenile detention centre (as a juvenile offender) and then in a prison (as an adult offender).

Collection methods: Information on a person's incarceration history is collected during the reception assessment on the National Prisoner Health Census Prison Entrants form.

Labour force status cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 383452

Registration status: Health, Standard 10/12/2009

DSS type: Data Element Cluster

Scope: All health professionals renewing their registration with the Australian Health Practitioner Regulation Agency.

Collection and usage attributes

Statistical unit: The statistical unit is the Registered health professional.

Guide for use: The data elements in this cluster, when used together, describe the labour force status of registered health professionals. The cluster assists to describe the size and availability of the health labour force.

The data can be output as sub-groups of the labour force using the following categories:

70. Employed
    1. Employed in Australia in registered profession
        1. Employed in the profession
        2. On extended leave
    2. Employed in Australia outside of registered profession
        1. Looking for work in registered profession
        2. Not looking for work in registered profession
    3. Employed overseas in registered profession
        1. Looking for work in Australia in registered profession
        2. Not looking for work in Australia in registered profession
71. Not employed in Australia
    1. Looking for work in Australia in registered profession
    2. Not looking for work in Australia in registered profession
72. Retired from registered profession in Australia

The employed category excludes those only engaged in unpaid and/or voluntary activities.

Not employed in Australia includes those who are not employed at all and those who are only employed outside Australia.

Collection methods: Data elements in this cluster comprise five key labour force concepts for the registered profession:

- Country of employment
- Extended leave status
- Jobseeker status
- Labour force status
- Retirement status

It is not necessary to collect these concepts as separate questions. Instead, they are best combined to form the response categories to a set of survey questions.

The following questions are an example of how the separate data elements from this cluster should be used together. They identify the labour force status of a health professional in the registered profession in the last week.

1. Last week, were you:

- Working in the registered profession in Australia? (continue with questionnaire)
- Employed in the registered profession but within a period of leave for 3 months or more? (thank you, nothing further)
- Working in the registered profession overseas? (go to question 2)
- Working, but not in the profession? (go to question 2)
- Not working in paid employment at all? (go to question 2)

2. Last week, did you take active steps to look for work in the registered profession in Australia?

Active steps include: applying for work in the profession, enquiring about a job, answering an advertisement, registering with an employment agency, advertising for work or contacting people in the profession about a job.

- No, I am retired from regular work
- No, not at all
- Yes, I looked for work (either full-time or part-time)

Thank you - no further questions

Main job of registered chiropractor cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	383989
Registration status:	Health, Standard 10/12/2009
DSS type:	Data Element Cluster

Scope:

The main job of registered chiropractors who were employed in the profession during the reference week.

The main job is defined as the post or position, funded by an organisation, in which the health professional worked the most hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.

Collection and usage attributes

Statistical unit:

The statistical unit for this data set is the Registered chiropractor.

A Registered chiropractor refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a chiropractor at any time during the reference period.

Guide for use:

Data elements in this cluster assist in describing the type and distribution of services of registered chiropractors in their main job. This cluster forms part of the Registered chiropractic labour force DSS, along with *Second job of registered chiropractor* cluster, *Work setting hours* cluster, and a range of other data elements.

Data elements in this cluster are collected from all chiropractors employed in the profession. Data elements in the *Second job of registered chiropractor* cluster are collected only from those health professionals employed in more than one job in the profession. All other workforce data elements in the Registered chiropractic labour force DSS are collected from all health professionals registered in the profession and relate to all jobs held in the profession.

Registered health professionals on leave at the time of registration are asked to report based on the job that is usually their main job.

The main job:

- includes time spent travelling to home visits or calls out;
- excludes other time travelling between work locations; and
- excludes unpaid professional and/or voluntary activities.

Main job of registered nursing professional cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	383993
Registration status:	Health, Standard 10/12/2009
DSS type:	Data Element Cluster
Scope:	The main job of registered nursing professionals who were employed in the profession during the reference week. The main job is defined as the post or position, funded by an organisation, in which the health professional worked the most hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.

Collection and usage attributes

Statistical unit:	The statistical unit for this data set is the Registered nursing professional. A Registered nursing professional refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a nurse at any time during the reference period.
Guide for use:	Data elements in this cluster assist in describing the type and distribution of services of registered nursing professionals in their main job. This cluster forms part of the Registered nursing labour force DSS, along with *Second job of registered nursing professional* cluster, *Work setting hours* cluster, and a range of other data elements. Data elements in this cluster are collected from all nursing health professionals employed in the profession. Data elements in the *Second job of registered nursing professional* cluster are collected only from those health professionals employed in more than one job in the profession. All other workforce data elements in the Registered nursing labour force DSS are collected from all health professionals registered in the profession and relate to all jobs held in the profession.

Registered health professionals on leave at the time of registration are asked to report based on the job that is usually their main job.

The main job:

- includes time spent travelling to home visits or calls out;
-
- excludes other time travelling between work locations; and
-
- excludes unpaid professional and/or voluntary activities.

Non-school qualification cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 413211

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction with each other to determine whether a person has a non-school qualification and if so, the level of that qualification.

Collection and usage attributes

Guide for use: The Non-school qualification cluster comprises two data elements that determine a person's non-school-qualification.

This is achieved through the combination of the two data elements: *Person—non-school qualification indicator, yes/no/not stated/inadequately described code N* and *Person—level of highest non-school qualification, code N*.

The Non-school qualification cluster describes the following information:

Data element		
Non-school qualification indicator	Yes	No
Level of non-school qualification	Code N	N/A

N/A is not applicable.

Collection methods: Information on a prison entrant's non-school qualifications is collected as part of the reception assessment on the National Prisoner Health Census Prison Entrants form.

Opioid pharmacotherapy treatment cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 407265

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data items are used in conjunction to determine:

- the number of prison entrants who have been on, or are currently on, an opioid pharmacotherapy treatment program; and
- the type of opioid pharmacotherapy treatment program a prison entrant has been on, or is on currently.

Collection and usage attributes

Guide for use: Opioid pharmacotherapy treatment (OPT) is a form of treatment for heroin or opiate dependence using prescribed opioid agonists, which have some properties similar or identical to those of heroin and morphine, including the effect on the brain, which alleviate withdrawal symptoms and block the craving for illicit opiates. The most common form of opioid pharmacotherapy treatment is methadone maintenance treatment. However, buprenorphine is also quite common in some countries (Kastelic et al. 2008).

The OPT program cluster comprises three data elements which provide information on a person's current and past OPT programs:
Person—previous opioid pharmacotherapy treatment program indicator, yes/no code N
Person—current opioid pharmacotherapy treatment program indicator, yes/no code N and
Person—type of opioid pharmacotherapy treatment, code N.

OPT program	Methadone	Methadone	Other	Other
	Current	Previous	Current	Previous
	Y/N	Y/N	Y/N	Y/N
	Y/N	Y/N	Y/N	Y/N

Never				

Collection methods: Data is collected at the reception assessment on the National Prisoner Health Census Prison Entrants form. Respondents may respond 'yes' to both 'on it now' and 'in the past'.

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: Kastelic A, Pont J & Stover H 2008. Opioid substitution treatment in custodial settings: a practical guide. Oldenburg: BIS-Verlag.

Pregnancy status cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	413204
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to determine whether a female prison entrant has ever been pregnant and if so, the age of her first pregnancy.

Collection and usage attributes

Guide for use:

The Pregnancy status cluster comprises two data elements that allow a female's pregnancy history to be determined.

This is achieved by the combination of the two data elements: *Female—ever been pregnant indicator, yes/no/not stated/inadequately described code N* and *Female—age at first pregnancy, total years N[N]*.

The Pregnancy status cluster describes the following information:

Data element		
Ever been pregnant	Yes	No
Age at first pregnancy	N[N]	N/A

N/A is not applicable.

Collection methods:

Information on a prison entrant's pregnancy history is collected at the reception assessment on the National Prisoner Health Census Prison Entrants form.

Prisoner health discharge summary cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 412281

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction with each other to determine:

- the number of sentenced and remand prisoners that were released from a prison during the National Prisoner Health Census period and
- the number of sentenced and remand prisoners who have a health-related discharge summary on file at the time of their release.

Collection and usage attributes

Guide for use: The Prisoner health discharge summary cluster combines the three data elements: *Person—prisoner health discharge summary indicator, yes/no code N, Person—legal status of prisoner, code N* and *Establishment (prison)—number of prisoners released, number N[NN]* to describe the number and type of prisoners who have a discharge summary on file when they are released from prison.

The Prisoner health discharge summary cluster describes the following information:

Detention status	Discharge summary indicator	Number
Remand[a]	Yes	N
Remand	No	N
Sentenced[b]	Yes	N
Sentenced	No	N

(a) Remand prisoners are persons who have been placed in custody while awaiting the outcome of a court hearing.

(b) Sentenced prisoners are those persons who have received a term of imprisonment from a court. This includes offenders who have been given an indeterminate sentence or custodial order, for example, forensic patients, or those who have received a life sentence.

Note: The number of prisoners who were released from a prison during the National Prisoner Health Census period does not include transfers to other prisons.

Radiotherapy for cancer cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	418354
Registration status:	Health, Standard 07/12/2011
DSS type:	Data Element Cluster

Scope:

The radiotherapy cluster consists of those data elements recommended for collection as best practice when the patient receives radiotherapy as part of the initial course of treatment for cancer. The radiotherapy cluster collects information on the radiotherapy type, dose, fractions, target site and the start and finish dates for each course of treatment.

Information on the type, dose, fractions and target site of radiotherapy is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the start and finish dates will enable an estimate of the duration of radiotherapy and the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities, potentially improving outcomes for patients.

Collection and usage attributes

Guide for use:

Capturing the radiotherapy dose and fractions is problematic at some target sites, for example, head and neck cancers and breast cancers. In these cases, treatment is complex with the use of multiple treatment fields and the overall total dose may need to be determined manually by the radiation oncologist.

Collection methods:

The radiotherapy type, dose, fractions, target site and start and finish dates are recorded for each course of radiotherapy the patient received during the initial course of treatment for cancer regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic course of treatment.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

Information regarding radiotherapy will typically be found in the radiation oncologist's summary letter for the initial course of treatment

Determining the total dose, number of fractions and target site of radiotherapy may require assistance from the radiation oncologist for consistent coding.

Second job of registered chiropractor cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 384019

Registration status: Health, Standard 10/12/2009

DSS type: Data Element Cluster

Scope: The second job of registered chiropractors who were employed in more than one job in the profession during the reference week.

The second job is defined as the post or position, funded by an organisation, in which the health professional worked the second longest hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.

Collection and usage attributes

Statistical unit: The statistical unit for this data set is the Registered chiropractor.

A Registered chiropractor refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a chiropractor at any time during the reference period.

Guide for use: Data elements in this cluster assist in describing the type and distribution of services of registered chiropractors in their second job. The cluster forms part of the Registered chiropractic labour force DSS, along with *Main job of registered chiropractor* cluster, *Work setting hours* cluster, and a range of other data elements.

Data elements in this cluster are collected only from those chiropractors employed in more than one job in the profession. Data elements in the *Main job of registered chiropractor* cluster are collected from all chiropractors employed in the profession. All other workforce data elements in the Registered chiropractic labour force DSS are collected from all chiropractors registered in the profession, and relate to all jobs held in the profession.

Registered health professionals on leave at the time of registration are asked to report based on the job that is usually their second job.

The second job:

- includes time spent travelling to home visits or calls out;
-
- excludes other time travelling between work locations; and
-
- excludes unpaid professional and/or voluntary activities.

All other workforce data elements in the Registered dental and allied dental labour force DSS are collected from all dental and allied dental health professionals registered in the profession, and relate to all jobs held in the profession.

Registered health professionals on leave at the time of registration are asked to report based on the job that is usually their second job.

The second job:

- includes time spent travelling to home visits or calls out;
-
- excludes other time travelling between work locations; and
-
- excludes unpaid professional and/or voluntary activities.

Second job of registered medical professional cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 375561

Registration status: Health, Standard 10/12/2009

DSS type: Data Element Cluster

Scope: The second job of registered medical professionals who were employed in more than one job in the profession during the reference week.

The second job is defined as the post or position, funded by an organisation, in which the health professional worked the second longest hours during the reference week in Australia. The health professional may be an employee or they may be self-employed with the organisation.

Collection and usage attributes

Statistical unit: The statistical unit for this data set is the Registered medical professional.

A Registered medical professional refers to a person who is currently registered, or who has been registered, with the Australian Health Practitioner Regulation Agency as a medical practitioner, medical specialist or medical specialist-in-training at any time during the reference period.

Guide for use: Data elements in this cluster assist in describing the type and distribution of services of registered medical professionals in their second job. The cluster forms part of the Registered medical labour force DSS, along with *Main job of registered medical professional* cluster, *Work setting hours* cluster, and a range of other data elements.

Data elements in this cluster are collected only from those medical professionals employed in more than one job in the profession. Data elements in the *Main* *job of registered medical professional* cluster are collected from all medical professionals employed in the profession. All other workforce data elements in the Registered medical labour force DSS are collected from all medical professionals registered in the profession, and relate to all jobs held in the profession.

Registered health professionals on leave at the time of registration are asked to report based on the job that is usually their second job.

The second job:

- includes time spent travelling to home visits or calls out;
-
- excludes other time travelling between work locations; and
-
- excludes unpaid professional and/or voluntary activities.

Sex of prison entrants cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	412252
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to describe the number of male and female prison entrants into a prison during the National Prisoner Health Census period.

Collection and usage attributes

Guide for use:

The Sex of prison entrants cluster comprises two data elements which allow data on the number of male and female prison entrants into a prison during the National Prisoner Health Census period to be determined.

This is achieved by the combination of the two data elements: *Establishment (prison)—number of prison entrants, number N[NN]* and *Person—sex, code N*.

The Sex of prison entrants cluster describes the following information:

Sex	Number of prison entrants
Male	N[NN]
Female	N[NN]

Comments:

The number and sex of prisoners entering Australia's prisons during the National Prisoner Health Census period will be used to derive statistics on the demographic characteristics of prison entrants.

Smoking status cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 413060

Registration status: Health, Standard 25/08/2011

DSS type: Data Element Cluster

Scope: These data elements are used in conjunction with each other to determine the history and current smoking status of a person.

Collection and usage attributes

Guide for use: The Smoking status cluster comprises four data elements that, in combination, determine a person's current smoking status and history of tobacco use.

This is achieved by the combination of the four data elements: *Person—ever smoked a full cigarette indicator, yes/no/not stated/inadequately described code N*; *Person—tobacco smoking start age, total years N[NN]*; *Person—current smoking status indicator, yes/no/not stated/inadequately described code N* and *Person—tobacco smoking frequency, current tobacco smoking frequency code N*.

The Smoking status cluster describes the following information:

Data element		
Ever smoked a full cigarette	Yes	No
Tobacco smoking start age	N[NN]	N/A
Current smoking status	Yes/No	N/A
Tobacco smoking frequency	Code N	N/A

N/A is not applicable.

Collection methods: Information on a prison entrant's smoking status and history are collected at the reception assessment on the National Prisoner Health Census Prison Entrants form.

Statistical linkage key 581 cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 349510

Registration status:
Community Services, Standard 21/05/2010
Housing assistance, Standard 23/08/2010
Health, Standard 07/12/2011
Early Childhood, Standard 21/05/2010
Homelessness, Standard 23/08/2010

DSS type: Data Element Cluster

Scope: Statistical data linkage refers to the bringing together of data from different sources to gain a greater understanding of a situation or individual from the combined (or linked) dataset. This facilitates a better understanding of the patterns of service use by groups of clients for research, statistical or policy analysis, planning and evaluation purposes.

Its form is: **XXXXXDDMMYYYYN**

The sequence in which the linkage key is completed is as follows:

Family name (the first 3 Xs)

Given name (the 4th and 5th X)

Date of birth by day, month and four-digit year

Sex

XXX 2nd, 3rd and 5th letters of the family name.

In the first three spaces the agency should record the 2nd, 3rd and 5th letters of the client's family name.

For example: If the client's family name is Smith the reported value should be MIH. If the client's family name is Jones the reported value should be ONS.

Regardless of the length of a person's name, the reported value should always be three characters long. If the legal family name is not long enough to supply the requested letters (i.e. a legal family name of less than five letters) then agencies should substitute the number '2' to reflect the missing letters. The placement of a number '2' should always correspond to the same space that the missing letter would have within the 3-digit field. A number (rather than a letter) is used for such a substitution in order to clearly indicate that an appropriate corresponding letter from the person's name is not available.

Cases where the family name has less than 5 letters:

If a person's family name is Farr, then value reported would be AR2 because the 2 is substituting for a missing 5th letter of the family name. Similarly, if the person's family name was Hua, then the value reported would be UA2 because the 2 is substituting for the missing 5th letter of the family name.

If a client's family name is missing altogether the agency should record the number 999 for all three spaces associated with the family name, (not the number 2). In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies should always ask the person to specify their legal first given name and their legal family name separately. These should then be recorded as first given name and family name as appropriate, regardless of the order in which they may be traditionally given.

If the client's family name includes non-alphabetic characters—for example hyphens (as in Lee-Archer), apostrophes (as in O'Mara) or blank spaces (as in De Vries)—these non-alphabetic characters should be ignored when counting the position of each character.

XX 2nd and 3rd letters of given name

In the fourth and fifth spaces the agency should record the 2nd and 3rd letters of the client's given name.

For example: If the client's given name is Elizabeth the reported value should be LI. If the client's given name is Robert the reported value should be OB.

If the client's given name includes non-alphabetic characters—for example hyphens (as in Jo-Anne) or apostrophes (as in D'Arcy), these non-alphabetic characters should be ignored when counting the position of each character.

Regardless of the length of a person's given name, the reported value should always be two characters long. If the given name of the person is not long enough to supply the requested letters (i.e. a name of less than three letters) then agencies should substitute the number '2' to reflect the missing letters. The placement of a number '2' should always correspond to the same space that the missing letter would have within the 2-digit field. A number (rather than a letter) is used for such substitutions in order to clearly indicate that an appropriate corresponding letter from the person’s name is not available.

For example: If the person’s legal name was Jo then the value reported would be O2 because the 2 is substituting for the missing 3rd letter of the given name.

If the person’s given name is missing altogether the agency should record 99 for the two spaces associated with the given name. In some cultures it is traditional to state the family name first. To overcome discrepancies in recording/reporting that may arise as a result of this practice, agencies should always ask the person to specify their given name and their family name separately. These should then be recorded as first given name and family name as appropriate, regardless of the order in which they may be traditionally given.

Date of Birth

DD represents the day in the month a person was born

MM represents the month in the year a person was born

YYYY represents the year a person was born

If date of birth is not known or cannot be obtained, provision should be made to collect or estimate age. Collected or estimated age would usually be in years for adults and to the nearest three months (or less) for children aged less than two years. Additionally, an estimated date flag or a date accuracy indicator should be reported in conjunction with all estimated dates of birth.

For data collections concerned with children’s services, it is suggested that the estimated date of birth of children aged under 2 years should be reported to the nearest 3 month period, i.e. 0101, 0104, 0107, 0110 of the estimated year of birth. For example, a child who is thought to be aged 18 months in October of one year would have his/her estimated date of birth reported as 0104 of the previous year. Again, an estimated date flag or date accuracy indicator http://meteor.aihw.gov.au/content/index.phtml/itemId/294429 should be reported in conjunction with all estimated dates of birth.

Sex

N represents whether or not the person is a 1. Male or 2. Female.

Operationally, sex is the distinction between male and female, as reported by a person or as determined by an interviewer.

When collecting data on sex by personal interview, asking the sex of the respondent is usually unnecessary and may be inappropriate, or even offensive. It is usually a simple matter to infer the sex of the respondent through observation, or from other cues such as the relationship of the person(s) accompanying the respondent, or first name. The interviewer may ask whether persons not present at the interview are male or female.

A person's sex may change during their lifetime as a result of procedures known alternatively as sex change, gender reassignment, transsexual surgery, transgender reassignment or sexual reassignment. Throughout this process, which may be over a considerable period of time, the person's sex could be recorded as either Male or Female.

In data collections that use the ICD-10-AM classification, where sex change is the reason for admission, diagnoses should include the appropriate ICD-10-AM code(s) that clearly identify that the person is undergoing such a process. This code(s) would also be applicable after the person has completed such a process, if they have a procedure involving an organ(s) specific to their previous sex (e.g. where the patient has prostate or ovarian cancer).

Code 3 Intersex or indeterminate

Is normally used for babies for whom sex has not been determined for whatever reason.

Should not generally be used on data collection forms completed by the respondent.

Should only be used if the person or respondent volunteers that the person is intersex or where it otherwise becomes clear during the collection process that the individual is neither male nor female.

Code 9 Not stated/inadequately described

Is not to be used on primary collection forms. It is primarily for use in administrative collections when transferring data from data sets where the item has not been collected.

Data that has been produced by linkage for statistical and research purposes should not be used subsequently for client management purposes.

This data cluster contains a set of specific data elements to be reported on in a predetermined combination.

Collection and usage attributes

Guide for use: Where a date of birth is estimated the date accuracy indicator should be used. Please see Relational attributes.

Substances used illicitly cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	413192
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to provide information on the type of substances a person has used illicitly in the last 12 months.

Collection and usage attributes

Guide for use:

The Substances used illicitly cluster comprises two data elements that capture information whether a person has possessed an illegal substance, or used a substance in an illegal manner, and the type of substance used illicitly.

These two data elements are: *Person—substance used illicitly indicator, yes/no/not stated/inadequately described code N* and *Person—type of substance used illicitly, drug of concern (ASCDC 2000 extended) code NNNN.*

Collection methods:

Information is collected at the reception assessment on the National Prisoner Health Census Prison Entrants form. This information is based on self-reporting.

Surgery for cancer cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	418356
Registration status:	Health, Standard 07/12/2011
DSS type:	Data Element Cluster

Scope:

Cancer-directed surgery is surgery that destroys or modifies cancer tissue anywhere in the body and includes biopsies that remove the entire tumour and/or leave only microscopic margins. It may be palliative, (to control symptoms, alleviate pain, or make the patient more comfortable), or curative.

The surgery treatment cluster consists of those data elements recommended for collection as best practice when cancer-directed surgery is performed as part of the initial course of treatment for cancer. The surgery treatment cluster collects information on the target sites of surgery, the procedure types and the date of each procedure.

Information on target sites and procedures is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the procedure dates will enable an estimate of the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities, potentially improving outcomes for patients.

Collection and usage attributes

Collection methods:

All cancer-directed surgery performed during the initial course of treatment is recorded regardless of treatment intent or timing.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic course of treatment.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease progression or recurrence.

This information should be collected from the patient's medical record.

Systemic therapy procedure for cancer cluster

Identifying and definitional attributes

Metadata item type: Data Set Specification

METeOR identifier: 418358

Registration status: Health, Standard 07/12/2011

DSS type: Data Element Cluster

Scope: Systemic therapy procedures refers to haematologic transplant and endocrine procedures. Haematologic transplants are bone marrow or stem cell transplants performed to protect patients from myelosuppression or bone marrow ablation associated with the administration of high-dose chemotherapy or radiotherapy.

Endocrine therapy is cancer therapy that achieves its antitumour effect through the use of radiation or surgical procedures that suppress the naturally occurring hormonal activity of the patient (when the cancer occurs at another site) and, therefore, alter or affect the long-term control of the cancer’s growth.

The systemic therapy procedure cluster consists of those data elements recommended for collection as best practice when the patient receives a systemic therapy procedure as part of the initial course of treatment for cancer.
The systemic therapy procedure cluster collects information on the systemic therapy procedure type and the dates of treatment.

Information on the systemic procedure type is required to evaluate patterns of care, the effectiveness of different treatment modalities and treatment by patient outcome. Collecting the procedure dates will enable an estimate of the time interval from diagnosis to treatment.

The use of standard definitions and formats supports the consistent collection and management of data and enables the integration of data from different sources. It provides a common language facilitating the interpretation and analysis of results, data linkage for statistical purposes, longitudinal studies and patient patterns of care and outcome studies. These results may then inform professional guidelines and training, quality assurance and the planning and evaluation of cancer control activities, potentially improving outcomes for patients.

Collection and usage attributes

Guide for use:

Systemic therapy procedures captures those infrequent instances whereby a medical, surgical, or radiation procedure is performed on a patient that has an effect on their hormonal or immunological balance.

- Haematologic procedures, such as bone marrow transplants or stem cell harvests, are typically used in conjunction with the administration of a systemic therapy agent(s), usually chemotherapy.
- Endocrine procedures, either radiological or surgical, may be administered in conjuction with systemic therapy agent(s), usually hormone therapy agents.
- As therapy during the initial course of treatment for cancer, haematologic procedures will rarely be administered in conjunction with endocrine radiation or surgery.

Collection methods:

Each systemic therapy procedure and procedure date delivered to the patient during the initial treatment for cancer should be recorded.

The data element *Healthcare provider—organisation identifier, N(16)* may be recorded for each treatment. It is recommended that, wherever possible, the database be configured to allow entry of different healthcare provider identifiers for each therapeutic course of treatment.

The initial course of treatment includes all treatments administered to the patient from diagnosis and before disease recurrence or progression.

This information should be collected from the patient's medical record.

Vaccines administered cluster

Identifying and definitional attributes

Metadata item type:	Data Set Specification
METeOR identifier:	411936
Registration status:	Health, Standard 25/08/2011
DSS type:	Data Element Cluster
Scope:	These data elements are used in conjunction with each other to describe the vaccination programs offered in Australia's prisons. They are collected together and reported as the number of vaccines administered during the National Prisoner Health Census period against each vaccination type within a prison.

Collection and usage attributes

Guide for use:

The Vaccines administered cluster comprises two data elements that, in combination, describe the number of hepatitis B, human papillomavirus (HPV) and meningococcal vaccines administered to prisoners during the National Prisoner Health Census period.

This is achieved by the combination of the two data elements: *Establishment (prison) – type of vaccine administered, code N* and *Establishment (prison) – number of vaccines administered, number N[NN].*

The Vaccines administered cluster describes the following information:

Vaccine type	Number
Hepatitis B vaccine	N[NN]
HPV vaccine	N[NN]
Meningococcal vaccine	N[NN]

Collection methods:

Information regarding the vaccines administered in a prison is provided by the manager of the prison's health services on the National Prisoner Health Census Prison Establishment form.

Comments:

Immunisation is highly effective in reducing morbidity and mortality caused by vaccine-

	preventable diseases. The National Immunisation Guidelines recommend that prisoners are vaccinated against hepatitis B and that females aged 19–26 years of age are vaccinated against human papillomavirus (HPV) (NHMRC 2008).

Admitted patient

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	268957
Registration status:	Health, Standard 01/03/2005

Definition: A patient who undergoes a hospital's **admission** process to receive treatment and/or care. This treatment and/or care is provided over a period of time and can occur in hospital and/or in the person's home (for **hospital-in-the-home** patients). The patient may be admitted if one or more of the following apply:

- the patient's condition requires clinical management and/or facilities not available in their usual residential environment
- the patient requires observation in order to be assessed or diagnosed
- the patient requires at least daily assessment of their medication needs
- the patient requires a procedure(s) that cannot be performed in a stand-alone facility, such as a doctor's room without specialised support facilities and/or expertise available (e.g. cardiac catheterisation)
- there is a legal requirement for admission (e.g. under child protection legislation)
- the patient is aged nine days or less.

Specialisation of: Person/group of persons

Collection and usage attributes

Guide for use: This metadata item should be used in conjunction with the definition of same-day patient in the glossary item same-day patient.

Part 2 of Schedule 3 of the National Health Act (type C) professional attention may be used as a guide for the medical services not normally requiring hospital treatment and therefore not generally related to admitted patients.

All babies born in hospital are admitted patients.

Comments: This definition includes all babies who are nine days old or less. However, all newborn days of stay are further divided into categories of qualified and unqualified for Australian Healthcare Agreements and health insurance benefit purposes. A newborn day is acute (qualified) when a newborn meets at least one of the following criteria:

- is the second or subsequent live born infant of a multiple birth, whose mother is currently an admitted patient;

- is admitted to an intensive care facility in a hospital, being a facility approved by the Commonwealth Health Minister for the purpose of the provision of special care;
- remains in hospital without its mother;
- is admitted to the hospital without its mother.

Acute (qualified) newborn days are eligible for health insurance benefit purposes and should be counted under the Australian Health Care Agreements. Days when the newborn does not meet these criteria are classified as unqualified (if they are nine days old or less) and should be recorded as such. Unqualified newborn days should not be counted under the Australian Health Care Agreements and are not eligible for health insurance benefit purposes.

Available bed

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 373634

Registration status: Health, Standard 03/12/2008

Definition: A suitably located and equipped bed chair, trolley or cot where the necessary financial and human resources are provided for admitted patient care.

Specialisation of: Organisation

Collection and usage attributes

Comments: This item supports a number of metadata items developed during 2007-08 to replace Establishment – number of available beds for admitted patients, average. The new definitions improve on the counting rules, the definition of availability and provide for the separate reporting of overnight-stay beds, same-day beds, hospital-in-the-home beds and neonatal cots (non-special-care).

During the development phase, it became clear that there are a multitude of bed descriptors, other than ‘available’, in use. In order to provide clarity in relation to ‘available beds’ other known terms are defined below:

- Active beds – alternative term for ‘available beds’.
- Approved beds – the maximum number of beds that the hospital is authorised to have. This may exceed the number of physical beds.
- Base beds - alternative term for ‘available beds’.
- Bed alternatives (QLD) – this term is used to describe furniture, other than beds in overnight wards, such as trolleys, chairs and cots, which provide accommodation for admitted patients – e.g. chairs/trolleys accommodating chemotherapy and dialysis patients.
- Bed Equivalents (NSW) – a method of equating same day beds to overnight beds – not necessary if counting overnight and same day beds separately.
- Capacity – term which can be used in conjunction with either available or physical beds, but more often the latter – to indicate the maximum number of beds that could be made available, given the appropriate level of funds and nursing and auxiliary staff.
- Designated beds – term used to describe beds set aside for specialist care, e.g. mental health.
- Flex beds – see ‘surge/flex beds’ below.

- Funded beds – may equate to 'available beds' unless the necessary human resources cannot be provided (e.g. due to a strike or nursing shortage).
- Licensed beds – this is an alternative term for 'approved beds', more commonly used for private hospitals where the maximum number of beds is often specified as part of the registration process.
- Medi-hotel bed – this term is used for beds in a non-ward residential service maintained and/or paid for by the hospital, as a substitute for traditional hospital ward accommodation. Residents may be accommodated in a medi-hotel overnight and be admitted as same-day patients or receive non-admitted patient services during the day. They may be accommodated in the medi-hotel before, during or after a multi-day admitted episode. Unlike hospital-in-the-home, however, no clinical services are provided in the medi-hotel and a significant decline in medical condition would always necessitate return from the medi-hotel to the hospital's Emergency Department or other ward. Thus residents are not reported as admitted while in the medi-hotel (unless they are on leave) and the medi-hotel beds are not counted as available for admitted patients.
- Occupied/Unoccupied beds – categorisation of available beds – a bed is occupied if there is a patient physically in the bed or the bed is being retained for a patient (e.g. the patient is receiving treatment or is on leave). Beds may be available but not occupied, e.g. an 8 bed ward may be fully staffed, but only 7 beds are occupied. Also if a patient has left a bed to receive a different care type and will not be returning within 24 hours, the bed is not occupied.
- Occupancy Rate – calculated by dividing total bed days in a period by the product of the available beds and the days in the period – e.g. if in a non-leap year patients accumulated 33,000 bed days in a hospital with 100 overnight-stay beds, the occupancy rate = 33,000/(365*100) = 90.4%. N.B. Occupancy rates calculated for same-day beds could exceed 100%.
- Open beds - alternative term for 'available beds'.
- Operational beds - alternative term for 'available beds'.
- Physical beds – the maximum number of beds that could be made available, given the appropriate level of funds and nursing and auxiliary staff.
- Seasonal beds – describes the movement in the number of available beds due to seasonal factors.
- Staffed beds – may equate to 'available beds' or may be lower depending on demand.

- Surge/flex beds (NSW) or Flex beds (SA) – the increase in the number of available beds that could be made by making arrangements for additional nursing and auxiliary staff, In other words, the number of surge/flex beds is the difference between the number of physical beds and the number of available beds.
- Swing beds – beds that can alternate between different types of care. Depending on the context, swing beds can be thought of as a sub-category of physical beds or available beds.
- Virtual bed – this term is used to denote a nominal location which the patient is held against in the hospital's patient administration system. This is because in the patient administration system each admitted patient needs to be held against a bed whether or not they are in a physical bed. For example, if a neonate is sharing a bed with the mother (e.g. in a birth centre) a cot may not be set up. Hospital-in-the-home (HITH) patients may also be held in a virtual bed.

Homelessness, Standard 23/08/2010

Definition: A person, group or organisation eligible to receive services either directly or indirectly from an agency.

Context: Agencies may provide assistance to individual persons, groups of persons (e.g. support groups) or to other organisations. All of these may be considered clients of an agency. Specific data collections may circumscribe the Type of clients that are included in the collection. For example, at the current stage of development of the Home and Community Care (HACC) Minimum Data Set (MDS), HACC funded agencies are only required to report on clients who are individual persons. Future developments may extend the coverage of the HACC MDS collection to include organisational or group clients.

The definition of a 'client' may also be circumscribed by the definition of 'assistance'. What is included as 'assistance' may depend on what activities are considered significant enough to warrant separate recording and reporting of the nature and/or amount of the assistance provided to a person. For example, an agency worker answering a telephone call from an anonymous member of the public seeking some basic information (e.g. a phone number for someone) would not usually consider that this interaction constituted assistance of sufficient significance to warrant recording that person as a 'client'.

Furthermore, what constitutes 'assistance' may be influenced by the type of assistance the agency was established to provide. In the above example, the agency in question was funded specifically to provide telephone advice, and referral information, to members of the public or specific sub-groups of the public. The agency may have a policy that all persons telephoning the agency for information are classified as clients, albeit anonymous clients.

The level of support or the amount of support given to a person by an agency can also be used to define them as a client or not. For example in the Supported

Accommodation Assistance Program (SAAP) National data collection, clients are defined by either taking up an amount of time of an agency; being accommodated by an agency; or by entering an ongoing support relationship with an agency.

Contracted hospital care

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268981

Registration status: Health, Standard 01/03/2005

Definition: Contracted hospital care is provided to a patient under an agreement between a purchaser of hospital care (contracting hospital or external purchaser) and a provider of an admitted or non-admitted service (contracted hospital).

Specialisation of: Service/care event

Collection and usage attributes

Guide for use: Related contracted hospital care metadata items should only be completed where services are provided which represent some, but not all of the contracted hospital's total services. It is not necessary to complete contracted hospital care items where all of the hospital services are contracted by a health authority, e.g. privately owned and/or operated public hospitals.

Contracted hospital care must involve all of the following:

- a purchaser, which can be a public or private hospital, or a health authority (department or region) or another external purchaser
- a contracted hospital, which can be a public or private hospital or day procedure centre
- the purchaser paying the contracted hospital for the contracted service; thus, services provided to a patient in a separate facility during their episode of care, where the patient is directly responsible for payment of this additional service, are not considered contracted services for reporting purposes
- the patient being physically present in the contracted hospital for the provision of the contracted service.

Thus, pathology or other investigations performed at another location on specimens gathered at the contracting hospital would not be considered contracted services for reporting purposes.

Allocation of diagnosis and procedure codes should not be affected by the contract status of an episode: the Australian Coding Standards should be applied when coding all episodes. In particular, procedures which would not otherwise be coded should not be coded solely because they were performed at another hospital under contract.

Procedures performed by a health care service (i.e. not a recognised hospital) should be coded if appropriate but are not considered to be contracted hospital procedures.

Any Diagnosis Related Group (DRG) derived for episodes involving contracted hospital care, should reflect the total treatment provided (all patient days and procedures), even where part of the treatment was provided under contract by another hospital.

Episode of residential care

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 376433

Registration status: Health, Standard 07/12/2011

Definition: The period of care between the start of residential care (either through the formal start of the residential stay or the start of a new reference period) and the end of the residential care (either through the formal end of residential care or the end of the reference period, i.e. 30 June).

Specialisation of: Service episode

Collection and usage attributes

Comments: For **resident**s provided with care intended to be on an overnight basis. This may occasionally include episodes of residential care that unexpectedly ended on the same day as they started (for example, the resident died or left against advice) or began at the end of the reference period (i.e. starting care on 30 June).

Episode of treatment for alcohol and other drugs

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268961

Registration status: Health, Standard 01/03/2005

Definition: The period of contact, with defined dates of commencement and cessation, between a client and a treatment provider or team of providers in which there is no change in the main treatment type or the principal drug of concern, and there has not been a non-planned absence of contact for greater than three months.

Context: Alcohol and drug treatment services. This concept is required to provide the basis for a standard approach to recording and monitoring patterns of service utilisation by clients.

Specialisation of: Service episode

Collection and usage attributes

Guide for use: A treatment episode must have a defined date of commencement of treatment episode for alcohol and other drugs and a date of cessation of treatment episode for alcohol and other drugs.

A treatment episode can have only one main treatment type for alcohol and other drugs and only one principal drug of concern. If the main treatment or principal drug changes then the treatment episode is closed and a new treatment episode is opened.

A treatment episode may also be considered closed (ceased) if there is a change in the treatment delivery setting or the service delivery outlet. Where the change reflects a substantial alteration in the nature of the treatment episode, for instance where an agency operates in more than one treatment setting (or outlet) they may consider that a change from one setting (or outlet), to another necessitates closure of one episode and commencement of a new one.

Collection methods: Is taken as the period starting from the date of commencement of treatment and ending at the date of cessation of treatment episode.

Source and reference attributes

Relational attributes

Data Element Concepts implementing this Object Class:	Healthcare provider—organisation identifier Health, Standard 07/12/2011

Hospital

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	268971
Registration status:	Health, Standard 01/03/2005
Definition:	A health care facility established under Commonwealth, state or territory legislation as a hospital or a free-standing day procedure unit, and authorised to provide treatment and/or care to patients.
Context:	Admitted patient care, admitted patient palliative care, admitted patient mental health care and public hospital establishments.
Specialisation of:	Organisation

Collection and usage attributes

Comments:

A hospital thus defined may be located at one physical site or may be a multicampus hospital. A multicampus hospital treats movements of patients between sites as ward transfers.

For the purposes of these definitions, the term hospital includes satellite units managed and staffed by the hospital.

This definition includes, but is not limited to, hospitals as recognised under Australian Health Care Agreements.

Residential aged care services as approved under the National Health Act 1953 (Cwlth.) or equivalent state legislation are excluded from this definition.

This definition includes entities with multipurpose facilities (e.g. those which contain both recognised and non-recognised components).

Household

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	268977
Registration status:	Community Services, Superseded 27/04/2007 Housing assistance, Standard 01/03/2005 Health, Standard 04/05/2005
Definition:	A group of two or more related or unrelated people who usually reside in the same dwelling, and who make common provision for food or other essentials for living. Or a single person living in a dwelling who makes provision for his or her own food and other essentials for living, without combining with any other person.
Context:	Together with family, household is considered one of the basic groups of social aggregation. Information on household numbers and composition aids in identifying groups within the population such as Indigenous households or the number of people living alone.
Specialisation of:	Person/group of persons

Collection and usage attributes

Guide for use:	For housing data collections, the number of tenancy agreements is a practical proxy for calculating the number of households receiving housing assistance. The persons in the group may pool their incomes and have a common budget to a greater or lesser extent: they may be related or unrelated persons, or a combination of both. Only usual residents of the household are included as members of the household. Visitors to a household are, by definition, excluded from the household.

Medical indemnity claim management episode

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	329600
Registration status:	Health, Standard 07/12/2011
Definition:	The management of a medical indemnity claim and recording the information relevant to that claim. Some main tasks in managing a medical indemnity claim include investigation of the allegations and facts related to the claim, engaging legal expertise, setting a **reserve** to cover costs arising from the claim and covering costs as they arise. Documentation of the conduct and outcomes of claim management produces the information relevant to the claim.

Mental health service contact

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	286670
Registration status:	Health, Standard 08/12/2004
Definition:	The provision of a clinically significant service by a specialised mental health service provider(s) for patients/clients, other than those patients/clients admitted to psychiatric hospitals or designated psychiatric units in acute care hospitals, and those resident in 24 hour staffed specialised residential mental health services, where the nature of the service would normally warrant a dated entry in the clinical record of the patient/client in question.
Specialisation of:	Service/care event

Collection and usage attributes

Guide for use:

A service contact must involve at least two persons, one of whom must be a specialised mental health service provider.

Mobile and outreach services and consultation and liaison services are included as service contacts.

Service contacts are not restricted to in person communication but can include telephone, video link or other forms of direct communication.

Service contacts can either be with a patient/client, or with a third party such as a carer or family member, other professional or mental health worker or other service provider. Services involving only a service provider and a third party(ies) are included as service contacts, where the nature of the service would normally warrant a dated entry in the clinical record of the patient/client in question.

There may be multiple service contacts on any one day for a patient/client or a third party(ies) and each service contact should be recorded separately.

A service contact should be recorded for each patient/client for which the service is provided, whether by phone or other electronic means or in person, regardless of the number of patients/clients or third parties participating or the number of service providers providing the service. Service provision is only regarded as a service contact if it is relevant to the clinical condition of the patient/client. This means that it does not include services of an administrative nature (e.g. telephone contact to schedule an appointment) except where the nature of the service would normally warrant a dated entry in the clinical record of the patient/client in question.

There may however be instances where notes are made in the patient/client clinical record that have not been prompted by a service provision for a patient/client (e.g. noting receipt of test results that require no further action). These instances would not be regarded as service contacts.

In instances where documenting the patient/client's service contact details is separated in time from the service provision, this is not counted as a separate service contact. Travel to or from the location at which the service is provided, for example to or from outreach facilities or private homes, is not to be reported as a service contact.

Non-admitted patient emergency department service episode

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 474114

Registration status: Health, Standard 30/01/2012

Definition: The treatment or care between when a patient presents at an **emergency department** and when the non-admitted patient emergency department clinical care ends.

Context: Emergency department care.

Specialisation of: Service episode

Collection and usage attributes

Guide for use: Includes patients who do not wait for treatment once registered or **triaged**, and those who are dead on arrival.

Both a non-admitted patient emergency department service episode and an admitted patient episode of care should be recorded for patients who subsequently undergo a formal admission. The end of the non-admitted patient emergency department service episode should indicate the commencement of the admitted episode of care, if applicable.

A non-admitted patient emergency department service episode ends when either the patient is admitted or, if the patient is not to be admitted, when the patient's emergency department non-admitted clinical care is recorded as completed, or when they are recorded as having left at their own risk.

Comments: This metadata item has been defined to support the national minimum data set for Non-admitted patient emergency department care.

Non-admitted patient service event

Identifying and definitional attributes

Metadata item type: Object Class

Synonymous names: Service event

METeOR identifier: 400604

Registration status: Health, Standard 06/10/2010
Tasmanian Health, Proposed 28/09/2011

Definition: An interaction between one or more healthcare provider(s) with one non-admitted patient, which must contain therapeutic/clinical content and result in a dated entry in the patient's medical record.

Context: Hospital non-admitted patient care:

This definition applies to non-admitted hospital patients and is not intended to apply to community based services.

Specialisation of: Service/care event

Collection and usage attributes

Guide for use: The Non-admitted patient (NAP) data set is intended to capture instances of healthcare provision from the point of view of the patient. This may be for assessment, examination, consultation, treatment and/or education.

One service event is recorded for each interaction, regardless of the number of healthcare providers present.

Events broken in time:

The period of interaction can be broken but still regarded as one service event if it was intended to be unbroken in time. This covers those circumstances in which treatment during a service event is temporarily interrupted for unexpected reasons, for example, a healthcare provider is called to assess another patient who requires more urgent care. Where a healthcare provider is unable to complete the interaction, it is considered to be a service event only if the definition of service event (above) is met.

Setting:

Service events can occur in an outpatient clinic or other setting.

Mode:

Service events delivered via Information and Communication Technology (ICT) (including but not limited to telephone and where the patient is participating via a video link) are included if:

- they are a substitute for a face-to-face service event, and

- the definition of a service event (above) is met.

Accompanied patients:

If a patient is accompanied by a carer/ relative, or the carer/relative acts on behalf of the patient with or without the patient present (e.g. mother of 2 year old patient or carer for incapacitated patient), only the patient's service event is recorded unless the carer/relative interaction meets the definition of a service event (above).

Note: carer refers to an informal carer only.

Service events delivered in groups:

Care provided to two or more patients by the same service provider(s) at the same time can also be referred to as a group session.

One service event is recorded for each patient who attends a group session regardless of the number of healthcare providers present, where the definition of a service event (above) is met.

Should a patient receive care both as an individual and as part of a group within a single session, this must be reported as two separate service events.

Service requests:

A service event is the result of a service request (including formal referral and self-referral or attendance at a walk-in clinic).

Activities which do not meet the definition of a service event include:

- Work-related services provided in clinics for staff.
- Non-attendances for a booked outpatient or booked outpatient services that did not go ahead.

Collection methods:

Where providers from multiple clinics, establishments or locations are present at a service event, only one service event should be reported nationally. This reflects the reality that, where providers from different organisations are involved, they are likely to record service events separately. This will be resolved into one service event, where possible, by the jurisdiction centrally before national reporting.

Occupied bed

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 375696

Registration status: Health, Standard 24/03/2009

Definition: An occupied bed is an available bed where there is a patient physically in the bed or the bed is being retained for a patient (e.g. the patient is receiving treatment or is on leave).

Specialisation of: Organisation

Collection and usage attributes

Comments: Beds may be available but not occupied, e.g. an 8 bed ward may be fully staffed, but only 7 beds are occupied. Also if a patient has left a bed to receive a different care type and will not be returning within 24 hours, the bed is not occupied.

The Occupancy Rate is calculated by dividing total bed days in a period by the product of the available beds and the days in the period – e.g. if in a non-leap year patients accumulated 33,000 bed days in a hospital with 100 overnight-stay beds, the occupancy rate = 33,000/(365*100) = 90.4%. N.B. Occupancy rates calculated for same-day beds could exceed 100%.

Pregnancy

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268966

Registration status: Health, Standard 01/03/2005

Definition: The period during which a woman carries a developing fetus, normally in the uterus. Pregnancy lasts for approximately 266 days, from conception until the baby is born, or 280 days from the first day of the last menstrual period. During pregnancy menstruation is absent, there may be a great increase in appetite, and the breasts increase in size; the woman may also experience morning sickness. These and other changes brought about by a hormone (progesterone) produced at first by the ovary and later by the placenta. Definite evidence of pregnancy is provided by various pregnancy tests, by the detection of the heartbeat of the fetus, and by ultrasound.

Residential stay

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	268960
Registration status:	Health, Standard 01/03/2005
Definition:	The period of care beginning with a formal start of residential care and ending with a formal end of the residential care and accommodation. It may involve more than one reference period, that is, more than one episode of residential care.
Context:	Specialised mental health services (Residential mental health care).
Specialisation of:	Service episode

Relational attributes

Data Element Concepts implementing this Object Class:	Residential stay—episode start date Health, Standard 01/03/2005

Service contact

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268983

Registration status: Health, Standard 01/03/2005

Definition: A contact between a patient/client and an ambulatory care health unit (including outpatient and community health units) which results in a dated entry being made in the patient/client record.

Context: Identifies service delivery at the patient level for mental health services (including consultation/liaison, mobile and outreach services).

A service contact can include either face-to-face, telephone or video link service delivery modes. Service contacts would either be with a client, carer or family member or another professional or mental health worker involved in providing care and do not include contacts of an administrative nature (e.g. telephone contact to schedule an appointment) except where a matter would need to be noted on a patient's record.

Service contacts may be differentiated from administrative and other types of contacts by the need to record data in the client record. However, there may be instances where notes are made in the client record that have not been prompted by a service contact with a patient/client (e.g. noting receipt of test results that require no further action). These instances would not be regarded as a service contact.

Specialisation of: Service/care event

Collection and usage attributes

Comments: The proposed definition is not able to measure case complexity or level of resource usage with each service contact alone. This limitation also applies to the concept of occasions of service (in admitted patient care) and hospital separations. The National Health Data Committee also acknowledges that information about group sessions or activities that do not result in a dated entry being made in each individual participant's patient/client record is not currently covered by this metadata item.

Service delivery outlet

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268970

Registration status: Health, Standard 01/03/2005

Definition: A site from which an organisation, or sub-unit of an organisation, delivers a health/community service.

Context: Alcohol and other drug treatment services:

Required to identify the agency sites that conduct treatment episodes, as distinguished from administration centres. Identification of sites from which health care or community services are delivered facilitates assessment of the accessibility of services to the population.

Specialisation of: Organisation

Collection and usage attributes

Comments: An organisation may have one or more service delivery outlets. An organisation with a devolved structure for service delivery may or may not devolve all functions to the service delivery outlet level. It is common for administrative functions, including personnel management, to be retained at a higher or central level of an organisation. The service delivery outlet is the lowest level of an organisation at which, or from which, services are delivered. The site from which a service is delivered relates to the physical location of the service and is to be clearly differentiated from the service delivery setting which refers to the type of physical setting in which a service is actually provided to a client (e.g. client's home, non-residential treatment facility etc).

For example, where a service provider regularly delivers a service at a variety of clients' homes (e.g. home visits every Monday, Wednesday and Friday) or a mobile service delivers a service to a variety of different locations, then the service delivery outlet should be recorded as the location of the clinic in which the service provider is based. However, where a mobile unit regularly (e.g. every Monday) delivers a service from the same geographical location then this location will be recorded as the service delivery outlet.

Specialised mental health service

Identifying and definitional attributes

Metadata item type: Object Class

METeOR identifier: 268984

Registration status: Health, Standard 01/03/2005

Definition: Specialised mental health services are those with a primary function to provide treatment, rehabilitation or community health support targeted towards people with a mental disorder or psychiatric disability. These activities are delivered from a service or facility that is readily identifiable as both specialised and serving a mental health care function.

Context: Hospitals and community mental health establishments and residential mental health establishments.

Specialisation of: Service/care event

Collection and usage attributes

Guide for use: The concept of a specialised mental health service is not dependent on the inclusion of the service within the state or territory mental health budget.

A service is not defined as a specialised mental health service solely because its clients include people affected by a mental disorder or psychiatric disability.

The definition excludes specialist drug and alcohol services and services for people with intellectual disabilities, except where they are established to assist people affected by a mental disorder who also have drug and alcohol related disorders or intellectual disability.

These services can be a sub-unit of a hospital even where the hospital is not a specialised mental health establishment itself (e.g. designated psychiatric units and wards, outpatient clinics etc.).

Specialised mental health service organisation

Identifying and definitional attributes

Metadata item type:	Object Class
METeOR identifier:	286449
Registration status:	Health, Standard 08/12/2004
Definition:	A separately constituted specialised mental health service that is responsible for the clinical governance, administration and financial management of service units providing specialised mental health care.
Context:	Specialised mental health services.
Specialisation of:	Organisation

Collection and usage attributes

Guide for use:

A specialised mental health service organisation may consist of one or more service units based in different locations and providing services in admitted patient, residential and ambulatory settings. For example, a specialised mental health service organisation may consist of several hospitals or two or more community centres.

Where the specialised mental health service organisation consists of multiple service units, those units can be considered to be components of the same organisation where they:

- operate under a common clinical governance arrangement;
- aim to work together as interlocking services that provide integrated, coordinated care to consumers across all mental health service settings; and
- share clinical records or, in the case where is more than one physical clinical record for each patient, staff may access (if required) the information contained in all of the physical records held by the organisation for that patient.

For most states and territories, the Specialised mental health service organisation object class is equivalent to the Area/District Mental Health Service. These are usually organised to provide the full range of admitted patient, residential and ambulatory services to a given catchment population. However, the object class may also be used to refer to health care organisations which provide only one type of mental health service (e.g. acute admitted patient care) or which serve a specialised or state-wide function.

Health, Standard 01/03/2005
Early Childhood, Standard 21/05/2010
Tasmanian Health, Proposed 30/09/2011

Definition: An identifier of the Australian state or territory.

Context: This is a **geographic indicator** which is used for analysis of the distribution of clients or patients, agencies or establishments and services.

Property group: Location characteristics

Relational attributes

Data Element Concepts implementing this Property:

Address—Australian state/territory identifier Community Services, Standard 06/02/2012
Health, Standard 07/12/2011
Early Childhood, Standard 09/03/2012

Establishment—Australian state/territory identifier Community Services, Standard 01/03/2005
Health, Standard 01/03/2005

Jurisdiction—Australian state/territory identifier Health, Standard 05/12/2007

Medical indemnity claim management episode—Australian state/territory identifier Health, Standard 07/12/2011

Person—Australian state/territory identifier Community Services, Standard 01/03/2005
Housing assistance, Standard 10/02/2006
Health, Standard 01/03/2005
Early Childhood, Standard 21/05/2010

Service provider organisation—Australian state/territory identifier Community Services, Standard 07/12/2005
Housing assistance, Proposed 01/11/2011
Health, Standard 04/05/2005
Early Childhood, Standard 21/05/2010
Tasmanian Health, Proposed 30/09/2011

Baby resuscitation method

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269026

Registration status: Health, Standard 01/03/2005

Definition: The action taken for a baby to revive from apparent death or unconsciousness.

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Origin: Macquarie University 2003. The Macquarie Dictionary 3rd ed. Sydney: The Macquarie Library Pty Ltd

Relational attributes

Data Element Concepts implementing this Property: Birth event—baby resuscitation method Health, Standard 01/03/2005

Behaviour-related risk factor intervention

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269285
Registration status:	Health, Standard 01/03/2005
Definition:	The action taken to address a behaviour-related risk factor.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of care—behaviour-related risk factor intervention Health, Standard 01/03/2005

Behaviour-related risk factor intervention purpose

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269286
Registration status:	Health, Standard 01/03/2005
Definition:	A lifestyle choice related risk factor associated with an intervention.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of care—behaviour-related risk factor intervention purpose Health, Standard 01/03/2005

Beta-blocker therapy status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	284791
Registration status:	Health, Standard 04/06/2004
Definition:	An indicator of the use of beta-blocker therapy.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—beta-blocker therapy status Health, Standard 04/06/2004

Birth method

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 337674

Registration status: Health, Standard 06/09/2006

Definition: The method of complete expulsion or extraction from its mother of a product of conception.

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Related metadata references: Supersedes Delivery method Health, Superseded 06/09/2006

Data Element Concepts implementing this Property: Birth event—birth method Health, Standard 06/09/2006

Birth order

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269038
Registration status:	Health, Standard 01/03/2005
Definition:	The sequence number in the multiple birth.
Context:	National Minimum Data Set (NMDS) Perinatal: Required to analyse pregnancy outcome according to birth order and identify the individual baby resulting from a multiple birth pregnancy. Multiple births have higher risks of perinatal mortality and morbidity. Multiple birth pregnancies are often associated with obstetric complications, labour and delivery complications, higher rates of neonatal morbidity, low **birthweight**, and a higher perinatal death rate. Data Set Specification (DSS) - Health care client identification: While this piece of information is normally recorded for multiple births against the mother's record, if the health care client volunteers the information, it should be recorded.
Property group:	Birth event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Origin:	AS5017 Health Care Client Identification

Relational attributes

Data Element Concepts implementing this Property:	Birth—birth order Health, Standard 01/03/2005

Birth plurality

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269039

Registration status: Health, Standard 01/03/2005

Definition: An indicator of multiple birth, showing the total number of births resulting from a single pregnancy.

Context: National Minimum Data Set (NMDS) Perinatal:

Multiple pregnancy increases the risk of complications during pregnancy, labour and delivery and is associated with higher risk of perinatal morbidity and mortality.

Data Set Specification (DSS) Health Care Client Identification:

While this piece of information is normally recorded for multiple births against the mother's record, if the health care client volunteers the information, it should be recorded.

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Birth event—birth plurality Health, Standard 01/03/2005

Birth presentation

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269062

Registration status: Health, Standard 01/03/2005

Definition: Presenting part of the fetus (at lower segment of uterus).

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Birth event—birth presentation Health, Standard 06/09/2006
Birth event—birth presentation Health, Superseded 06/09/2006

Birth status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269064
Registration status:	Health, Standard 01/03/2005
Definition:	Status of the baby at birth as an outcome of pregnancy.
Property group:	Birth event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Birth—birth status Health, Standard 01/03/2005

Birth weight

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269347
Registration status:	Health, Standard 01/03/2005
Definition:	The weight of a newborn as recorded at birth.
Property group:	Physical characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Birth—birth weight Health, Standard 01/03/2005

Birth weight recorded indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	441697
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether **birth weight** has been recorded.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property:	Person—birth weight recorded indicator Health, Standard 07/12/2011

Bleeding episode status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	360954
Registration status:	Health, Standard 01/10/2008
Definition:	An episode of bleeding.
Property group:	Health and wellbeing

Relational attributes

Related metadata references:	Supersedes Bleeding episode status Health, Superseded 01/10/2008
Data Element Concepts implementing this Property:	Person—bleeding episode status Health, Standard 01/10/2008

Bleeding location

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	344781
Registration status:	Health, Standard 01/10/2008
Definition:	The source of bleeding or escape of blood from a vessel.
Property group:	Crisis event

Relational attributes

Data Element Concepts implementing this Property:	Person with acute coronary syndrome—bleeding location Health, Standard 01/10/2008

Blindness

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269103
Registration status:	Health, Standard 01/03/2005
Definition:	Blindness is less than 6/60 vision in the better eye with glasses. Vision 6/60 is the ability to see only at 6 metres what the normal eye can see at 60 metres. An indicator of the presence or development of a visual impairment or inability to see.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—blindness Health, Standard 01/03/2005

Blood pressure

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269105
Registration status:	Health, Standard 01/03/2005
Definition:	The pressure exerted by blood against the inner walls of the blood vessels
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Origin:	Macquarie University 2003. The Macquarie Dictionary 3rd ed. Sydney: The Macquarie Library Pty Ltd

Relational attributes

Data Element Concepts implementing this Property:	Person—blood pressure (diastolic) Health, Standard 01/03/2005 Person—blood pressure (systolic) Health, Standard 01/03/2005

Blood pressure measurement result less than or equal to 130/80 mmHg indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	443226
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a **blood pressure** measurement result was less than or equal to 130/80mmHg.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW).

Relational attributes

Data Element Concepts implementing this Property:	Person—blood pressure measurement result less than or equal to 130/80 mmHg indicator Health, Standard 07/12/2011

Blood pressure measurement result recorded indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	441400
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a **blood pressure** measurement result has been recorded.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property:	Person—blood pressure measurement result recorded indicator Health, Standard 07/12/2011

Blow to the head indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	358829
Registration status:	Community Services, Standard 06/02/2012 Health, Standard 25/08/2011
Definition:	An indicator of whether a blow to the head resulting in a loss of consciousness has ever been experienced.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—blow to the head indicator Community Services, Standard 06/02/2012 Health, Standard 25/08/2011

Bodily location of main injury

Identifying and definitional attributes

Metadata item type:	Property
Synonymous names:	Site
METeOR identifier:	269098
Registration status:	Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The position on the body of the primary injury of concern.
Property group:	Crisis event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—bodily location of main injury Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011

Body function

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	320237
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The physiological or psychological function of body system.
Property group:	Physical characteristics

Relational attributes

Data Element Concepts implementing this Property:	Person—body function Community Services, Standard 16/10/2006 Health, Standard 29/11/2006

Body mass index

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269114

Registration status: Health, Standard 01/03/2005

Definition: A measure of body fat that gives an indication of nutritional status. Body mass index is the weight in kilograms divided by the square of the height in meters.

Property group: Health and wellbeing

Source and reference attributes

Origin: Dorland's Illustrated Medical Dictionary 30th ed. Philadelphia: Saunders

Relational attributes

Data Element Concepts implementing this Property:

Adult—body mass index Health, Standard 01/03/2005

Child—body mass index Health, Standard 01/03/2005

Person—body mass index (classification) Health, Standard 01/03/2005

Body mass index recorded indicator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 443079

Registration status: Health, Standard 07/12/2011

Definition: An indicator of whether body mass index (BMI) has been recorded.

Property group: Performance indicators

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property: Person—body mass index recorded indicator Health, Standard 07/12/2011

Body structure

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 320249

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: An anatomical part of the body such as organs, limbs or their components.

Property group: Physical characteristics

Relational attributes

Data Element Concepts implementing this Property: Person—body structure Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Building/complex sub-unit type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269380
Registration status:	Community Services, Standard 30/09/2005 Health, Standard 01/03/2005
Definition:	The specification of the type of a separately identifiable portion within a building/complex, marina, etc. to clearly distinguish it from another.
Context:	Australian addresses.
Property group:	Location characteristics

Source and reference attributes

Submitting organisation:	Health Data Standards Committee
Origin:	Australia Post Address Presentation Standard.

Relational attributes

Data Element Concepts implementing this Property:	Person (address)—building/complex sub-unit type Community Services, Standard 30/09/2005 Health, Standard 01/03/2005 Service provider organisation (address)—building/complex sub-unit type Community Services, Standard 30/09/2005 Health, Standard 04/05/2005

Bundle-branch block status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	343860
Registration status:	Health, Standard 01/10/2008
Definition:	The status of an abnormal conduction through one of the conductive branches which normally supply the right and left ventricles of the heart.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Electrocardiogram—bundle-branch block status Health, Standard 01/10/2008

C-reactive protein level

Identifying and definitional attributes

Metadata item type: Property

Synonymous names: CRP

METeOR identifier: 338236

Registration status: Health, Standard 01/10/2008

Definition: The measured level of the inflammatory marker C-reactive protein.

Property group: Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property: Person—C-reactive protein level (measured) Health, Standard 01/10/2008

C-reactive protein level measured date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	338273
Registration status:	Health, Standard 01/10/2008
Definition:	The date the level of the inflammatory marker C-reactive protein (CRP) is measured.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person—C-reactive protein level measured date Health, Standard 01/10/2008

C-reactive protein level measured time

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	343849
Registration status:	Health, Standard 01/10/2008
Definition:	The time the level of the inflammatory marker C-reactive protein measured.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person—C-reactive protein level measured time Health, Standard 01/10/2008

Caesarean section indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	302129
Registration status:	Health, Standard 29/11/2006
Definition:	Pregnancy resulting in a live birth or a stillbirth.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	National Perinatal Data Development Committee

Relational attributes

Data Element Concepts implementing this Property:	Female—caesarean section indicator Health, Standard 29/11/2006

Cancer staging scheme source

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	296984
Registration status:	Health, Standard 04/06/2004
Definition:	The reference which describes in detail the methods of staging and the definitions for the classification system used in determining the extent of cancer.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Reference documents:	UICC TNM Classification of Malignant Tumours (5th Edition) (1997)

Relational attributes

Data Element Concepts implementing this Property:	Cancer staging—cancer staging scheme source Health, Superseded 07/12/2011 Cancer staging—cancer staging scheme source Health, Standard 07/12/2011

Cancer staging scheme source edition number

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	402076
Registration status:	Health, Standard 07/12/2011
Definition:	The edition number of the reference used for the purpose of staging a cancer. Refers to the reference that describes in detail the methods of staging and the definitions for the classification system used in determining the extent of cancer.
Property group:	Health and wellbeing

Relational attributes

Related metadata references:	Supersedes Cancer staging scheme source edition number Health, Superseded 07/12/2011
Data Element Concepts implementing this Property:	Cancer staging—cancer staging scheme source edition number Health, Standard 07/12/2011

Cancer status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	394063
Registration status:	Health, Standard 07/12/2011
Definition:	Clinical evidence of the presence or absence of cancer. Clinical evidence describes the result of evaluation of a patient's physical condition and prognosis based on information gathered from physical examination, laboratory tests, imaging and the patient's medical history.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Cancer Australia
Reference documents:	Myers T (Editor) 2009. Mosby's Medical Dictionary, 8th Edition. Missouri: Mosby Elsevier page 394

Relational attributes

Data Element Concepts implementing this Property:	Patient—cancer status Health, Standard 07/12/2011

Cancer treatment type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	288143
Registration status:	Health, Standard 04/06/2004
Definition:	The type of cancer treatment provided.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Cardiac catheterisation date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359783
Registration status:	Health, Standard 01/10/2008
Definition:	The date when a catheter is inserted into a chamber or vessel of the heart for diagnostic purposes.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—diagnostic cardiac catheterisation date Health, Standard 01/10/2008

Cardiac catheterisation time

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359770
Registration status:	Health, Standard 01/10/2008
Definition:	The time when a catheter is inserted into a chamber or vessel of the heart for diagnostic purposes.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—diagnostic cardiac catheterisation time Health, Standard 01/10/2008

Cardiovascular disease condition targeted by drug therapy

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269329
Registration status:	Health, Standard 01/03/2005
Definition:	A descriptor of the cardiovascular disease condition for which a drug therapy is being used.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—cardiovascular disease condition targeted by drug therapy Health, Standard 01/03/2005

Cardiovascular disease recorded indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	465944
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a cardiovascular disease has been recorded.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property:	Hospital census (of elective surgery waitlist patients)—census date Health, Standard 01/03/2005

Cerebral stroke due to vascular disease

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269298
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of previous experience of a cerebral stroke due to vascular disease and the recency of the stroke.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—cerebral stroke due to vascular disease Health, Standard 01/03/2005

Cervical screening indicator

Identifying and definitional attributes

Metadata item type: Property

Synonymous names: Pap smear indicator

METeOR identifier: 358912

Registration status: Health, Standard 25/08/2011

Definition: An indicator of whether a cervical screening has been conducted.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Female—cervical screening indicator Health, Standard 25/08/2011

Cessation reason

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269077
Registration status:	Health, Standard 01/03/2005
Definition:	The reason for ending an event or process.
Property group:	Exit/leave from service event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of treatment for alcohol and other drugs—cessation reason Health, Standard 01/03/2005

Chemotherapy completion date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	393546
Registration status:	Health, Standard 07/12/2011
Definition:	The date on which chemotherapy was completed. Chemotherapy is the treatment of disease by means of chemical substances or drugs; the term is usually used in reference to neoplastic disease. Chemotherapy for the treatment of cancer achieves its antitumour effect through the use of antineoplastic drugs that inhibit the reproduction of cancer cells by interfering with DNA synthesis and mitosis. Chemotherapy may involve treatment with a single agent or a combination of two or more drugs that are administered in treatment cycles and according to a prespecified regimen or protocol.
Property group:	Exit/leave from service event

Chemotherapy cycles administered

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 393825

Registration status: Health, Standard 07/12/2011

Definition: The number of cycles of chemotherapy administered.

Chemotherapy is the treatment of disease by means of chemical substances or drugs; usually used in reference to neoplastic disease. Chemotherapy for the treatment of cancer achieves its antitumour effect through the use of antineoplastic drugs that inhibit the reproduction of cancer cells by interfering with DNA synthesis and mitosis.

Chemotherapy may involve treatment with a single agent or a combination of two or more drugs that are administered in treatment cycles and according to a prespecified regimen or protocol.

Chemotherapy cycles reflect the timing, frequency and duration of treatment.

Property group: Service provision event

Diagnosis date of first recurrence as distant metastasis

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	447402
Registration status:	Health, Standard 07/12/2011
Definition:	The date of first recurrence as distant metastatic disease. The term recurrence defines the return, reappearance or metastasis of cancer (of the same histology) after a disease-free intermission or remission. Distant metastasis refers to the spread of cancer of the same histology as the original (primary) tumour to distant organs or distant lymph nodes.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Cancer Australia
Reference documents:	American College of Surgeons 1998. Standards of the Commission on Cancer: Registry Operations and Data Standards (ROADS), Volume II, Commission on Cancer

Relational attributes

Data Element Concepts implementing this Property:	Patient—diagnosis date of first recurrence as distant metastasis Health, Standard 07/12/2011

Diagnosis date of first recurrence as locoregional cancer

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 447405

Registration status: Health, Standard 07/12/2011

Definition: The date of first recurrence as locoregional cancer.

The term recurrence defines the return, reappearance or metastasis of cancer (of the same histology) after a disease free period.

Locoregional recurrence refers to the recurrence of cancer cells at the same site as the original (primary) tumour or the regional lymph nodes after a disease free period.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Cancer Australia

Reference documents: American College of Surgeons 1998. Standards of the Commission on Cancer: Registry Operations and Data Standards (ROADS), Volume II, Commission on Cancer

Relational attributes

Data Element Concepts implementing this Property: Patient—diagnosis date of first recurrence as locoregional cancer Health, Standard 07/12/2011

Diagnosis related group

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269188

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: A resource utilisation classification based on diagnosed conditions, usage of hospital resources, and demographic characteristics of the patient.

Context: The development of Australian refined diagnosis related groups has created a descriptive framework for studying hospitalisation. Diagnosis related groups provide a summary of the varied reasons for hospitalisation and the complexity of cases a hospital treats. Moreover, as a framework for describing the products of a hospital (that is, patients receiving services), they allow meaningful comparisons of hospitals' efficiency and effectiveness under alternative systems of health care provision.

Property group: Service provision event

Relational attributes

Data Element Concepts implementing this Property: Episode of admitted patient care—diagnosis related group
Health, Standard 01/03/2005

Registration status: Health, Standard 25/08/2011

Definition: An indicator of whether a person has ever carried a developing embryo or fetus within their body.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Female—ever been pregnant indicator Health, Standard 25/08/2011

Ever smoked a full cigarette indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	399267
Registration status:	Health, Standard 25/08/2011
Definition:	An indicator of having, in the past, smoked a cigarette in its entirety.
Property group:	Lifestyle characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—ever smoked a full cigarette indicator Health, Standard 25/08/2011

Expenses

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 356286

Registration status: Health, Standard 05/12/2007

Definition: Expenses consisting mainly of wages, salaries and supplements, purchases of goods and services and consumption of fixed capital (depreciation).

Property group: Financial characteristics

Collection and usage attributes

Collection methods: Data are collected and nationally collated for the reporting period—the financial year ending in 30 June each year.

Source and reference attributes

Submitting organisation: Health Expenditure Advisory Committee

Reference documents: Australian Bureau of Statistics 2006. Australian System of Government Finance Statistics: Concepts, sources and methods, 2005. Cat. no. 5514.0.55.001 Canberra: ABS.

Extended leave status in registered profession

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	383409
Registration status:	Health, Standard 10/12/2009
Definition:	Whether a person is on extended leave from their position of employment in the registered profession.
Context:	Employed persons.
Property group:	Labour characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Registered health professional—extended leave status in registered profession Health, Standard 10/12/2009

Extended wait patient indicator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269074

Registration status: Health, Standard 01/03/2005

Definition: An indicator of a patient who has experienced a prolonged wait for care.

Property group: Performance indicators

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Elective surgery waiting list episode—extended wait patient indicator Health, Standard 01/03/2005

Extent of environmental factor influence

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	320232
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The degree to which specified environmental factors influence functioning and disability.
Property group:	Environmental characteristics

Relational attributes

Data Element Concepts implementing this Property:	Person—extent of environmental factor influence Community Services, Standard 16/10/2006 Health, Standard 29/11/2006

Extent of harm from a health-care incident

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 330187

Registration status: Health, Standard 07/12/2011

Definition: The overall effect of a health-care incident in terms of impairment, activity limitation or participation restriction.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Patient—extent of harm from a health-care incident Health, Standard 07/12/2011

Extent of impairment of body function

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	320240
Registration status:	Community Services, Standard 16/10/2006 Health, Standard 29/11/2006
Definition:	The degree of impairment in a specified body function.

Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person—functional stress test performed indicator Health, Standard 01/10/2008

Funding eligibility indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269120
Registration status:	Health, Standard 01/03/2005
Definition:	Whether eligible services are actually funded.
Property group:	Funding characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of care—funding eligibility indicator Health, Standard 01/03/2005

Geographic location

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269234
Registration status:	Community Services, Standard 01/03/2005 Housing assistance, Retired 10/02/2006 Health, Standard 01/03/2005 Early Childhood, Standard 21/05/2010
Definition:	A description of physical location.
Property group:	Location characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Establishment—geographic location Health, Standard 01/03/2005 Service delivery outlet—geographic location Health, Standard 01/03/2005

Geographic remoteness

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 396537

Registration status: Housing assistance, Proposed 01/11/2011
Health, Standard 07/12/2011

Definition: The remoteness of a location, based on the physical road distance to the nearest urban centre and its population size.

Context: Geographic remoteness is essentially a measure of a physical location's level of access to goods and services. Large population centres tend to have a greater range of goods and services available than small centres. Typically, a population centre is not likely to provide a full range of goods and services until its population reaches around 250,000 people.

Property group: Location characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Guide for use:

National health data dictionary specific:

Gross capital expenditure is capital expenditure as reported by the particular establishment having regard to state health authority and other authoritative guidelines as to the differentiation between capital and recurrent expenditure. (A concise indication of the basis on which capital and recurrent expenditure have been differentiated is to form part of national minimum data sets).

National housing assistance data dictionary specific:

Expenditure on the acquisition or enhancement of an asset (excluding financial assets). A non-financial asset is an entity functioning as a store of value, over which ownership may be derived over a period of time, and which is not a financial asset. Capital includes: acquisitions (purchase of properties); construction costs; redevelopment and improvement (of properties); land acquisitions and development; joint ventures.

METeOR identifier:	288666
Registration status:	Health, Standard 04/06/2004
Definition:	Reason for which treatment is provided for a particular condition.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Cancer treatment—intention of treatment Health, Standard 04/06/2004 Patient—intention of treatment Health, Standard 07/12/2011

Inter-hospital contracted patient status

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269338

Registration status: Health, Standard 01/03/2005

Definition: An indicator identifying a patient as being treated as part of a contracted hospital care agreement.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Episode of care—inter-hospital contracted patient status Health, Standard 01/03/2005

International postcode

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 288969

Registration status: Community Services, Standard 30/09/2005
Health, Standard 04/05/2005

Definition: A descriptor for a postal delivery area, aligned with locality, suburb or place.

Property group: Location characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Person (address)—international postcode Community Services, Standard 30/09/2005
Health, Standard 04/05/2005

Service provider organisation (address)—international postcode Community Services, Standard 30/09/2005
Health, Standard 04/05/2005

Interpreter service required status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269289
Registration status:	Community Services, Standard 01/03/2005 Housing assistance, Retired 10/02/2006 Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	An indicator of a need for a translation service.
Property group:	Demographic/social/cultural characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—interpreter service required Community Services, Standard 10/04/2006 Health, Standard 08/02/2006 Tasmanian Health, Proposed 28/09/2011 Person—interpreter service required status (health) Health, Superseded 08/02/2006

Intra-aortic balloon pump procedure date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359618
Registration status:	Health, Standard 01/10/2008
Definition:	The date when an intra-aortic balloon pump is inserted to improve the strength of the hearts contraction.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—intra-aortic balloon pump procedure date Health, Standard 01/10/2008

Intra-aortic balloon pump procedure time

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 359686

Registration status: Health, Standard 01/10/2008

Definition: The time when an intra-aortic balloon pump is inserted to improve the strength of the hearts contraction.

Property group: Service provision event

Relational attributes

Data Element Concepts implementing this Property: Person—intra-aortic balloon pump procedure time Health, Standard 01/10/2008

Intravenous fibrinolytic therapy date

Identifying and definitional attributes

Metadata item type:	Property
Synonymous names:	IV fibrinolytic therapy
METeOR identifier:	284981
Registration status:	Health, Standard 04/06/2004
Definition:	The date of intravenous (IV) fibrinolytic therapy.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—intravenous fibrinolytic therapy date Health, Superseded 01/10/2008 Person—intravenous fibrinolytic therapy date Health, Standard 01/10/2008

Intravenous fibrinolytic therapy time

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 285193

Registration status: Health, Standard 04/06/2004

Definition: The time intravenous (IV) fibrinolytic therapy was first administered.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Acute coronary syndrome data working group

Relational attributes

Data Element Concepts implementing this Property: Person—intravenous fibrinolytic therapy time Health, Standard 04/06/2004

Ischaemic and perfusion outcome result

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 349698

Registration status: Health, Standard 01/10/2008

Definition: Imbalances of relative blood flow to the left ventricular muscle tissue reflected through the ischaemic and perfusion outcomes of a functional stress test.

Property group: Health and wellbeing

Relational attributes

Related metadata references: Supersedes Functional stress test ischaemic result Health, Superseded 01/10/2008

Data Element Concepts implementing this Property: Functional stress test—ischaemic and perfusion outcome result Health, Standard 01/10/2008

Jobseeker status in registered profession

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	383436
Registration status:	Health, Standard 10/12/2009
Definition:	Whether a person is seeking employment in their registered profession.
Property group:	Labour characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Registered health professional—jobseeker status in registered profession Health, Standard 10/12/2009

Killip classification

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 285143

Registration status: Health, Standard 04/06/2004

Definition: Identifies the Killip class, as a measure of haemodynamic compromise.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Person—Killip classification Health, Standard 04/06/2004

Labour augmentation type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269084
Registration status:	Health, Standard 01/03/2005
Definition:	A descriptor of the method used to assist progress of labour.
Property group:	Birth event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Birth event—labour augmentation type Health, Standard 01/03/2005

Labour force status

Identifying and definitional attributes

Metadata item type: Property

Synonymous names: Employment status

METeOR identifier: 269067

Registration status: Community Services, Standard 01/03/2005
Housing assistance, Standard 22/10/2005
Health, Standard 01/03/2005
Homelessness, Standard 23/08/2010

Definition: An indicator of participation in paid employment or economic inactivity.

Property group: Labour characteristics

Relational attributes

Data Element Concepts implementing this Property: Health professional—labour force status Health, Standard 01/03/2005

Person—labour force status Community Services, Standard 01/03/2005
Housing assistance, Standard 01/08/2005
Health, Standard 01/03/2005
Homelessness, Standard 23/08/2010

Registered health professional—labour force status Health, Standard 10/12/2009

Labour force status 30 days prior to imprisonment

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	410612
Registration status:	Health, Standard 25/08/2011
Definition:	Participation in paid employment or economic inactivity 30 days prior to imprisonment.
Property group:	Labour characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Prison entrant—labour force status 30 days prior to imprisonment Health, Standard 25/08/2011

Labour induction type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269085
Registration status:	Health, Standard 01/03/2005
Definition:	A descriptor of the method used to induce labour.
Property group:	Birth event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Birth event—labour induction type Health, Standard 01/03/2005

Labour onset type

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269058

Registration status: Health, Standard 01/03/2005

Definition: A descriptor of the manner in which labour commences.

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Birth event—labour onset type Health, Standard 01/03/2005

Last contact date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269344
Registration status:	Health, Standard 01/03/2005
Definition:	The date on which last contact between a service provider and a patient/client occurred.
Property group:	Exit/leave from service event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Community nursing service episode—last contact date Health, Standard 01/03/2005

Laterality of primary cancer

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269179

Registration status: Health, Standard 01/03/2005

Definition: An indicator of which side of a paired organ is the origin of the primary cancer.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Person with cancer—laterality of primary cancer Health, Standard 01/03/2005

Legal status of prisoner

Identifying and definitional attributes

Metadata item type: Property

Synonymous names: Prisoner custody status; detention status of prisoner

METeOR identifier: 412275

Registration status: Health, Standard 25/08/2011

Definition: The legal basis for detaining a prisoner, determined by warrant or court order/s.

Property group: Legal characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Origin: ABS (Australian Bureau of Statistics) 2010. Prisoners in Australia. Cat. no. 4517.0. Canberra: ABS

Relational attributes

Data Element Concepts implementing this Property: Person—legal status of prisoner Health, Standard 25/08/2011

Prison entrant—legal status of prisoner Health, Standard 25/08/2011

Length of employment in profession

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	375472
Registration status:	Health, Standard 10/12/2009
Definition:	The length of time spent working in the registered profession.
Context:	Registered health labour force
Property group:	Labour characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Registered health professional—length of employment in profession in Australia Health, Standard 10/12/2009

Length of stay

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269031

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: The duration of an episode of care or service event that includes the provision of accommodation and/or residential care.

Property group: Performance indicators

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:

Episode of admitted patient care—length of stay (excluding leave days) Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Episode of admitted patient care—length of stay (including leave days) Health, Standard 01/03/2005

Episode of admitted patient care—length of stay (special/neonatal intensive care) Health, Standard 01/03/2005

Letters of family name

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 349486

Registration status: Community Services, Standard 27/03/2007
Housing assistance, Standard 23/08/2010
Health, Standard 07/12/2011
Early Childhood, Standard 21/05/2010
Homelessness, Standard 23/08/2010

Definition: A specific combination of letters selected from a family name (surname).

Property group: Identifier characteristics

Relational attributes

Data Element Concepts implementing this Property: Person—letters of family name Community Services, Standard 27/03/2007
Housing assistance, Standard 23/08/2010
Health, Standard 07/12/2011
Early Childhood, Standard 21/05/2010
Homelessness, Standard 23/08/2010

Letters of given name

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	314125

Low-density lipoprotein cholesterol level

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 310787

Registration status: Health, Standard 27/10/2005

Definition: The level of the serum cholesterol carried on low-density lipoproteins, approximately 60 to 70 percent of the total serum cholesterol.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Origin: Dorland's Illustrated Medical Dictionary 30th ed. Philadelphia: Saunders

Relational attributes

Data Element Concepts implementing this Property: Person—low-density lipoprotein cholesterol level Health, Standard 01/03/2005

Lower limb amputation due to vascular disease

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269165
Registration status:	Health, Standard 01/03/2005
Definition:	The removal of a toe, forefoot or leg (above or below knee), due to vascular disease.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—lower limb amputation due to vascular disease Health, Standard 01/03/2005

Lymphovascular invasion

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	370612
Registration status:	Health, Standard 06/03/2009
Definition:	Presence or absence of the invasion of the cancer cells into the blood vessels or lymphatic channels.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person with cancer—lymphovascular invasion Health, Standard 06/03/2009

Main activity type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	356578
Registration status:	Community Services, Recorded 04/03/2010 Health, Standard 05/12/2007
Definition:	A descriptor of the main activity type of an organisation.
Property group:	Organisational characteristics

Source and reference attributes

Submitting organisation:	Health Expenditure Advisory Committee

Relational attributes

Data Element Concepts implementing this Property:	Health industry relevant organisation—main activity type Health, Standard 05/12/2007

Main language other than English spoken at home

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269176
Registration status:	Community Services, Standard 01/03/2005 Housing assistance, Standard 22/10/2005 Health, Standard 01/03/2005 Homelessness, Standard 13/10/2011
Definition:	The primary language spoken at home, excluding English.
Property group:	Demographic/social/cultural characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—main language other than English spoken at home Community Services, Standard 01/03/2005 Housing assistance, Standard 10/02/2006 Health, Standard 01/03/2005

Major diagnostic category

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269328
Registration status:	Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The classification of diagnoses (and Australian refined diagnosis related groups) by body system or aetiology.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of admitted patient care—major diagnostic category Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011

Marital status

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269101

Registration status: Community Services, Standard 01/03/2005
Housing assistance, Standard 22/10/2005
Health, Standard 01/03/2005

Definition: An indicator of involvement in a couple relationship or marriage.

Property group: Demographic/social/cultural characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Housing assistance, Standard 10/02/2006
Health, Standard 01/03/2005

Maternal medical condition

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269069
Registration status:	Health, Standard 01/03/2005
Definition:	Pre-existing and concurrent conditions that affect a pregnancy or its outcome.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Female (pregnant)—maternal medical condition Health, Standard 01/03/2005

Maximum stenosis coronary artery

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	344331
Registration status:	Health, Standard 01/10/2008
Definition:	The greatest point of an abnormal narrowing in the coronary artery.
Property group:	Physical characteristics

Relational attributes

Data Element Concepts implementing this Property:	Person—maximum stenosis coronary artery Health, Standard 01/10/2008

MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	441367
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of whether a Medicare Benefits Schedule (MBS) Health Assessment for Aboriginal and Torres Strait Islander People (Item 715) has been received.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property:	Person—MBS Health Assessment for Aboriginal and Torres Strait Islander People (MBS Item 715) indicator Health, Standard 07/12/2011

Medical indemnity claim commencement date

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 329612

Registration status: Health, Standard 07/12/2011

Definition: The date on which a medical indemnity claim commenced, as signalled by a trigger such as the issue of a letter of demand, issue of writ, or an offer made by the defendant to the claimant.

Property group: Legal characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Medical indemnity claim—medical indemnity claim commencement date Health, Standard 07/12/2011

Medical indemnity claim finalisation date

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 329628

Registration status: Health, Standard 07/12/2011

Definition: The date on which a medical indemnity claim was settled, a final court decision was delivered, or the claim file was closed (whichever occurred first).

Property group: Legal characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Steward: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Medical indemnity claim management episode—medical indemnity claim finalisation date Health, Standard 07/12/2011

Medical indemnity claim finalisation mode

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	330104
Registration status:	Health, Standard 07/12/2011
Definition:	The process by which a medical indemnity claim was finalised including state/territory-based complaints processes, court-based alternative dispute resolution processes, court decision, statutorily mandated conference process or discontinuation.
Property group:	Legal characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Steward:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Medical indemnity claim—medical indemnity claim finalisation mode Health, Standard 07/12/2011

Medical indemnity claim identifier

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	329767
Registration status:	Health, Standard 07/12/2011
Definition:	An identifier for each medical indemnity claim, unique within a health authority.
Property group:	Legal characteristics

Number of antenatal care visits

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 426460

Registration status: Health, Standard 12/10/2011

Definition: A count of **antenatal care visits** attended.

The number of antenatal care visits is an indicator of access and use of health care during pregnancy. The antenatal period presents opportunities for reaching pregnant women with interventions that may be vital to their health and wellbeing and that of their infants. Receiving antenatal care at least four times, as recommended by World Health Organization (WHO), increases the likelihood of receiving effective maternal health interventions during antenatal visits (WHO 2011).

Antenatal care visits for women with an uncomplicated pregnancy should include advice, education, reassurance, support and treatment for minor problems of pregnancy, as well as effective screening throughout the pregnancy, to identify problems as they arise, with referral as appropriate (Breeze & Kean 2009).

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: National Perinatal Epidemiology and Statistics Unit

Reference documents: Breeze A & Kean L 2009. Routine antenatal management at the booking clinic. Obstetrics and Gynaecology and Reproductive Medicine 20 (1): 1-6.

Number of positive regional lymph nodes

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 289189

Registration status: Health, Standard 04/06/2004

Definition: The total number of regional lymph nodes examined by a pathologist and reported as containing tumour. A regional lymph node is a lymph node that drains lymph from the region around a tumor.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Person with cancer—number of positive regional lymph nodes Health, Standard 04/06/2004

Number of positive sentinel lymph nodes

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	370545
Registration status:	Health, Standard 06/03/2009
Definition:	The total number of sentinel lymph nodes examined by a pathologist and reported as containing tumour. Sentinel lymph nodes are the first nodes that filter fluid draining away from the area of cancer. The number of lymph nodes with metastasis is important for cancer staging
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person with cancer—number of positive sentinel lymph nodes Health, Standard 06/03/2009

Number of pregnant prisoners

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	365486
Registration status:	Health, Standard 25/08/2011
Definition:	A count of women prisoners carrying a developing fetus, normally in the uterus, anytime over a specified 12 month period.
Property group:	Organisational characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Establishment (prison)—number of pregnant prisoners Health, Standard 25/08/2011

Number of previous caesarean sections

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	298035
Registration status:	Health, Standard 29/11/2006
Definition:	A count of the number of previous caesarean sections.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	National Perinatal Data Development Committee

Relational attributes

Data Element Concepts implementing this Property:	Female—number of caesarean sections Health, Standard 29/11/2006

Number of previous pregnancies

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269051
Registration status:	Health, Standard 01/03/2005
Definition:	A count of previous pregnancies.
Context:	Perinatal statistics: The number of previous pregnancies is an important component of the woman's reproductive history. Parity may be a risk factor for adverse maternal and perinatal outcomes.
Property group:	Health and wellbeing

Collection and usage attributes

Guide for use:

In multiple pregnancies with more than one type of outcome, the pregnancies should be recorded in the following order:

- all live births
- stillbirth
- spontaneous abortion
- induced abortion
- ectopic pregnancy

A pregnancy resulting in multiple births should be counted as one pregnancy.

Where the outcome was one stillbirth and one live birth, count as stillbirth.

If a previous pregnancy was a hydatidiform mole, code as spontaneous or induced abortion (or rarely, ectopic pregnancy), depending on the outcome.

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Female—number of previous pregnancies Health, Standard 01/03/2005

Number of prison entrants

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	412248
Registration status:	Health, Standard 25/08/2011
Definition:	A count of persons entering prison.
Property group:	Organisational characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Establishment (prison)—number of prison entrants Health, Standard 25/08/2011

Number of prisoners released

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	410572
Registration status:	Health, Standard 25/08/2011
Definition:	A count of the persons, held in prison, who have been released.
Property group:	Organisational characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Establishment (prison)—number of prisoners released Health, Standard 25/08/2011

Number of psychiatric care days

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269361
Registration status:	Health, Standard 01/03/2005
Definition:	A count of days of in which specialised psychiatric care was received.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of care—number of psychiatric care days Health, Standard 01/03/2005

Number of psychiatric outpatient clinic/day program attendances

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269353

Registration status: Health, Standard 01/03/2005

Definition: A count of the days on which a psychiatric outpatient clinic or a day program was attended.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Patient—number of psychiatric outpatient clinic/day program attendances Health, Standard 01/03/2005

Number of qualified days

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269081
Registration status:	Health, Standard 01/03/2005
Definition:	A count of the days within an episode of admitted patient care that are designated as having a **newborn qualification status**.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Episode of admitted patient care (newborn)—number of qualified days Health, Standard 01/03/2005

Number of regional lymph nodes examined

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	415982
Registration status:	Health, Standard 07/12/2011
Definition:	A count of the number of regional lymph nodes, which drain lymph from the region around the tumour, examined by a pathologist.
Property group:	Service provision event

Source and reference attributes

Registration status:	Health, Standard 01/10/2008
Definition:	The date when an artificial pacemaker is inserted to regulate the heart beat.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—pacemaker insertion date Health, Standard 01/10/2008

Pacemaker insertion time

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 359657

Registration status: Health, Standard 01/10/2008

Definition: The time when an artificial pacemaker is inserted to regulate the heart beat.

Property group: Service provision event

Relational attributes

Data Element Concepts implementing this Property: Person—pacemaker insertion time Health, Standard 01/10/2008

Palliative care strategic plan indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	288321
Registration status:	Health, Standard 05/12/2007
Definition:	An indicator of the existence of a written strategic plan for palliative care.
Property group:	Performance indicators

Relational attributes

Data Element Concepts implementing this Property:	Administrative health region—palliative care strategic plan indicator Health, Standard 05/12/2007

Parity

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	302011
Registration status:	Health, Standard 29/11/2006
Definition:	A count of previous pregnancies resulting in a live birth or stillbirth.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	National Perinatal Data Development Committee

Relational attributes

Data Element Concepts implementing this Property:	Female—parity Health, Standard 29/11/2006

Partner organisation type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	290699
Registration status:	Health, Standard 05/12/2007
Definition:	The type of organisation with which an organisation has a formal working partnership in place.
Property group:	Organisational characteristics

Source and reference attributes

Submitting organisation:

Relational attributes

Data Element Concepts implementing this Property:	Service provider organisation—partner organisation type Health, Standard 05/12/2007

Patient election status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	339067
Registration status:	Health, Standard 28/11/2006
Definition:	An indicator of whether a person has elected to be treated as either a public or private patient.
Property group:	Funding characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Related metadata references:	Supersedes Elected accommodation status Health, Superseded 28/11/2006
Data Element Concepts implementing this Property:	Episode of admitted patient care—patient election status Health, Standard 28/11/2006

Patient listing status

Identifying and definitional attributes

Metadata item type:	Property
Synonymous names:	Readiness for care
METeOR identifier:	269041
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator a person's readiness to commence an awaited procedure.
Property group:	Service/care urgency

Relational attributes

Data Element Concepts implementing this Property:	Elective surgery waiting list episode—patient listing status Health, Standard 01/03/2005

Patient present status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269111
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of a patient's presence at a service event.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Non-admitted patient service event—patient present status Health, Standard 01/03/2005

Patient/client participation indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	286845
Registration status:	Health, Standard 08/12/2004
Definition:	An indication of participation in a service contact.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Mental health service contact—patient/client participation indicator Health, Standard 08/12/2004

Patients/clients in residence at year end

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269091
Registration status:	Health, Standard 01/03/2005
Definition:	A count of admitted patients/clients in residence at the end of the normal financial year.
Property group:	Performance indicators

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Establishment—patients/clients in residence at year end Health, Standard 01/03/2005

Percutaneous coronary intervention procedure type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359745
Registration status:	Health, Standard 01/10/2008
Definition:	The type of procedure performed during a percutaneous coronary intervention (PCI).
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—percutaneous coronary intervention procedure type Health, Standard 01/10/2008

Period of residence in Australia

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269092
Registration status:	Health, Standard 01/03/2005
Definition:	The length of time lived in Australia.
Property group:	Demographic/social/cultural characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—period of residence in Australia Health, Standard 01/03/2005

Peripheral neuropathy indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269164
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of peripheral nerve disorders of any cause.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—peripheral neuropathy indicator Health, Standard 01/03/2005

Peripheral vascular disease indicator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269093

Registration status: Health, Standard 01/03/2005

Definition: An indicator of the presence of peripheral vascular disease.

Context: Public health, health care and clinical settings.

Property group: Health and wellbeing

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Person—peripheral vascular disease indicator (foot) Health, Standard 01/03/2005

Person identifier

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269369
Registration status:	Community Services, Standard 01/03/2005 Housing assistance, Standard 01/03/2005 Health, Standard 01/03/2005
Definition:	A sequence of characters which identify a person.
Property group:	Identifier characteristics

Source and reference attributes

Submitting organisation:	National minimum data set working parties

Relational attributes

Data Element Concepts implementing this Property:	Person—person identifier Community Services, Standard 25/08/2005 Health, Standard 04/05/2005 Person—person identifier (within establishment/agency) Community Services, Superseded 25/08/2005 Health, Superseded 04/05/2005

Pharmacotherapy type prescribed in hospital

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	344340
Registration status:	Health, Standard 01/10/2008
Definition:	The type of pharmacotherapy prescribed for the treatment of acute coronary syndrome in hospital including the emergency department.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person with acute coronary syndrome—pharmacotherapy type prescribed in hospital Health, Standard 01/10/2008

Pharmacotherapy type taken post discharge from hospital

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	351101
Registration status:	Health, Standard 01/10/2008
Definition:	Pharmacotherapy type taken following discharge from hospital.
Property group:	Health and wellbeing

Relational attributes

Data Element Concepts implementing this Property:	Person with acute coronary syndrome—pharmacotherapy type taken post discharge from hospital Health, Standard 01/10/2008

Physical activity sufficiency status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269095
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of whether a level of activity is sufficiently vigorous to confer a health benefit.
Property group:	Lifestyle characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—physical activity sufficiency status Health, Standard 01/03/2005

Physical departure date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	322593
Registration status:	Health, Standard 24/03/2006 Tasmanian Health, Proposed 28/09/2011
Definition:	The date on which a patient or client physically departs a service or facility.
Property group:	Exit/leave from service event

Source and reference attributes

Submitting organisation:	Australian Government Department of Health and Ageing

Relational attributes

Data Element Concepts implementing this Property:	Emergency department stay—physical departure date Health, Superseded 17/04/2012 Tasmanian Health, Proposed 28/09/2011 Emergency department stay—physical departure date Health, Standard 22/12/2011

Physical departure time

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 322606

Registration status: Health, Standard 24/03/2006
Tasmanian Health, Proposed 28/09/2011

Definition: The time at which a patient or client physically departs a service or facility.

Property group: Exit/leave from service event

Source and reference attributes

Submitting organisation: Australian Government Department of Health and Ageing

Relational attributes

Data Element Concepts implementing this Property: Emergency department stay—physical departure time Health, Superseded 22/12/2011
Tasmanian Health, Proposed 28/09/2011

Emergency department stay—physical departure time Health, Standard 22/12/2011

Place of occurrence

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269393
Registration status:	Health, Standard 01/03/2005
Definition:	The physical location in which an event occurred.
Property group:	Location characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Injury event—place of occurrence Health, Standard 01/03/2005

Planned hospital transfer indicator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 402775

Registration status: Health, Standard 25/08/2011

Definition: An indicator of whether the relocation of a person from an establishment to a hospital was planned or unplanned.

Property group: Transport characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Establishment (prison)—planned hospital transfer indicator Health, Standard 25/08/2011

Pneumococcal disease immunisation indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	460012
Registration status:	Health, Standard 07/12/2011
Definition:	An indicator of immunisation against pneumococcal disease.

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare (AIHW)

Relational attributes

Data Element Concepts implementing this Property:	Person—pneumococcal disease immunisation indicator Health, Standard 07/12/2011

Postal delivery point identifier

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269334
Registration status:	Community Services, Standard 01/03/2005 Health, Standard 01/03/2005
Definition:	A sequence of assigned characters which uniquely identify a postal delivery point.
Property group:	Location characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person (address)—postal delivery point identifier Community Services, Superseded 06/02/2012 Health, Standard 01/03/2005 Service provider organisation (address)—postal delivery point identifier Community Services, Superseded 06/02/2012 Health, Standard 04/05/2005

Postal delivery service type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269382
Registration status:	Health, Standard 01/03/2005
Definition:	The type of distribution service for mail and packages
Context:	Australian addresses.
Property group:	Location characteristics

Source and reference attributes

Submitting organisation:	Health Data Standards Committee

Relational attributes

Data Element Concepts implementing this Property:	Person—postal delivery service type Health, Standard 01/03/2005

Postal delivery service type identifier

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269381

Registration status: Community Services, Standard 06/02/2012
Health, Standard 01/03/2005

Definition: The specification of the identification of a postal delivery service such as General Post Office Box, Community Mail Bag, etc. to clearly distinguish it from another when applicable.

Context: Australian addresses.

Property group: Location characteristics

Source and reference attributes

Submitting organisation: Health Data Standards Committee

Relational attributes

Data Element Concepts implementing this Property: Person (address)—postal delivery service type identifier
Health, Standard 01/03/2005

Postpartum perineal status

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269054

Registration status: Health, Standard 01/03/2005

Definition: An indicator of the condition of the perineum after birth.

Property group: Birth event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Female (mother)—postpartum perineal status Health, Standard 01/03/2005

Pre-vocational training services grants for non-government organisations

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 288095

Registration status: Health, Standard 08/12/2004

Definition: Grants made to non-government organisations for the provision of pre-vocational training services.

Property group: Funding characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Specialised mental health service organisation—pre-vocational training services grants for non-government organisations Health, Standard 08/12/2004

Preferred language

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269244
Registration status:	Community Services, Standard 10/04/2006 Housing assistance, Standard 13/10/2011 Health, Standard 01/03/2005 Homelessness, Standard 13/10/2011 Tasmanian Health, Proposed 28/09/2011
Definition:	The language most preferred for communication.
Property group:	Demographic/social/cultural characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—preferred language Community Services, Standard 10/04/2006 Housing assistance, Standard 13/10/2011 Health, Standard 01/03/2005 Homelessness, Standard 13/10/2011 Tasmanian Health, Proposed 28/09/2011

Pregnancy completion date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269257
Registration status:	Health, Standard 01/03/2005
Definition:	The date on which a pregnancy was completed.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Pregnancy (last previous)—pregnancy completion date Health, Standard 01/03/2005

Pregnancy indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	303950
Registration status:	Health, Standard 22/09/2005
Definition:	An indicator of a developing embryo or fetus within a body.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Origin:	Dorland’s Illustrated Medical Dictionary 30th ed. Philadelphia: Saunders

Relational attributes

Related metadata references:	Supersedes Current pregnancy status Health, Superseded 22/09/2005
Data Element Concepts implementing this Property:	Female—pregnancy indicator Health, Standard 21/09/2005

Pregnancy outcome

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269049
Registration status:	Health, Standard 01/03/2005
Definition:	The end result of a period of pregnancy.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Pregnancy (last previous)—pregnancy outcome Health, Standard 01/03/2005

Premature cardiovascular disease family history status

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269233
Registration status:	Health, Standard 01/03/2005
Definition:	Indicates whether there is a history of early cardiovascular conditions within the family.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—premature cardiovascular disease family history status Health, Standard 01/03/2005

Presentation date

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269321

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: The date on which the patient/client presented for the delivery of a service.

Property group: Entry into service event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Emergency department stay—presentation date Health, Standard 22/12/2011

Health service event—presentation date Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Presentation time

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269146
Registration status:	Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011
Definition:	The time at which a person presents for the delivery of a service.
Property group:	Entry into service event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Emergency department stay—presentation time Health, Standard 22/12/2011 Health service event—presentation time Health, Standard 01/03/2005 Tasmanian Health, Proposed 28/09/2011

Previous opioid pharmacotherapy treatment program indicator

Identifying and definitional attributes

Metadata item type:	Property
Synonymous names:	Opioid replacement program
METeOR identifier:	404735
Registration status:	Health, Standard 25/08/2011
Definition:	An indicator of previous participation in a drug-based opioid dependence treatment program.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—previous opioid pharmacotherapy treatment program indicator Health, Standard 25/08/2011

Previous specialised treatment

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	269308
Registration status:	Health, Standard 01/03/2005
Definition:	An indicator of the receipt of prior care in the same specialty as the current treatment.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Patient—previous specialised treatment Health, Standard 01/03/2005

Primary body function or structure affected

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	330158
Registration status:	Health, Standard 07/12/2011
Definition:	The primary body function or structure alleged to have been affected.
Property group:	Health and wellbeing

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare
Steward:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Patient—primary body function or structure affected Health, Standard 07/12/2011

Primary incident or allegation type

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	425722
Registration status:	Health, Standard 07/12/2011
Definition:	A description of the main event or circumstance that led, or may have led, to unintended or unnecessary harm.
Property group:	Legal characteristics

Prison health clinic visit initiator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 376342

Registration status: Health, Standard 25/08/2011

Definition: The party responsible for initiating contact with the prison health clinic.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Health service event—prison health clinic visit initiator Health, Standard 25/08/2011

Prisoner health discharge summary indicator

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	412258
Registration status:	Health, Standard 25/08/2011
Definition:	An indicator of whether a summary of the health-care provided is on the prisoner's medical file at the time of release from prison. The summary may contain information on the prisoner's medical history including current problems, allergies, scheduled appointments, any investigations (i.e. blood tests, current medications, vaccination record) and contact details for further information on the prisoner.
Property group:	Exit/leave from service event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Person—prisoner health discharge summary indicator Health, Standard 25/08/2011

Prisoner location

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	418449
Registration status:	Health, Standard 25/08/2011
Definition:	The physical location of a prisoner.
Property group:	Accommodation/living characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Health service event—prisoner location Health, Standard 25/08/2011

Prisoner location when service provider was needed, but not utilised

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	418811
Registration status:	Health, Standard 25/08/2011
Definition:	The physical location of a prisoner when they needed to, but did not, engage with a professional who provides a service or care.
Property group:	Service provision event

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Health service event—prisoner location when service provider was needed, but not utilised Health, Standard 25/08/2011

Procedure

Identifying and definitional attributes

Metadata item type: Property

Synonymous names: Clinical intervention; Surgical operation

METeOR identifier: 269052

Registration status: Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Definition: A series of steps performed by a healthcare professional through which a desired result is intended to be accomplished.

Property group: Service provision event

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Reference documents: Dorland I & Newman W.A 2003. Dorland's illustrated medical dictionary, 30th ed. Philadelphia: Saunders.

Relational attributes

Data Element Concepts implementing this Property: Episode of admitted patient care—procedure Health, Standard 01/03/2005
Tasmanian Health, Proposed 28/09/2011

Procedure commencement date

Identifying and definitional attributes

Metadata item type:	Property

Radiation dose administered

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 433489

Registration status: Health, Standard 07/12/2011

Definition: The amount of radiation administered.

Radiotherapy is the treatment of disease by means of ionizing radiation.

The amount or dose of radiation administered is measured in grays. The gray (Gy) is the SI (International System of Units) unit of absorbed radiation dose of ionizing radiation (for example, X-rays), and is defined as the absorption of one joule of ionizing radiation by one kilogram of matter (usually human tissue).

Radiotherapy fractions administered

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 393508

Registration status: Health, Standard 07/12/2011

Definition: The number of radiotherapy fractions or treatment sessions administered.

Radiotherapy is the treatment of disease by means of ionizing radiation.

Administration of the total dose of radiation is spread out over time and delivered to the patient in a number of even parts or treatment sessions (fractions). Although a treatment session may include several treatment portals delivered within a confined period of time, usually a few minutes, it is still considered one fraction.

Recurrent expenditure

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 269132

Registration status: Housing assistance, Standard 01/03/2005
Health, Standard 13/05/2005

Definition: Expenditure which does not result in the acquisition or enhancement of an asset.

Property group: Financial characteristics

Collection and usage attributes

Guide for use: National Housing Assistance Data Dictionary specific:

Recurrent expenditure on goods and services is expenditure, which does not result in the creation or acquisition of fixed assets (new or second-hand). It consists mainly of expenditure on wages, salaries and supplements, purchases of goods and services and consumption of fixed capital (depreciation).

When fees charged for goods and services are offset against recurrent expenditure, the result equates to final consumption expenditure in the Australian Bureau of Statistics' national accounts framework.

Includes:

- Operating expenses
- Tenancy manager revenue and expense components.

Regular client indicator

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 436655

Registration status: Community Services, Standard 06/02/2012
Health, Standard 07/12/2011

Definition: An indicator of whether a client is a regular client of an organisation or agency.

Property group: Client characteristic

Collection and usage attributes

Comments: The definition of a regular client can vary depending on the context and/or collection in which the term is being applied, but generally involves a minimum number of visits to an organisation or agency or uses of a facility, occurring over a specific period of time. For example, in the primary health care context a regular client may be someone who has visited a particular primary health care provider 3 or more times in the last 2 years.

Respite services grants to non-government organisations

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 288749

Registration status: Health, Standard 08/12/2004

Definition: Grants made to non-government organisations for the provision of respite services.

Property group: Funding characteristics

Source and reference attributes

Submitting organisation: Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property: Specialised mental health service organisation—respite services grants to non-government organisations Health, Standard 08/12/2004

Retirement status in registered profession

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	383422
Registration status:	Health, Standard 10/12/2009
Definition:	Whether a person is retired from their position of employment in the registered profession.
Property group:	Labour characteristics

Source and reference attributes

Submitting organisation:	Australian Institute of Health and Welfare

Relational attributes

Data Element Concepts implementing this Property:	Registered health professional—retirement status in registered profession Health, Standard 10/12/2009

Revascularisation percutaneous coronary intervention date

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359586
Registration status:	Health, Standard 01/10/2008
Definition:	The date when percutaneous coronary intervention is performed for subsequent restoration of blood flow.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—revascularisation percutaneous coronary intervention date Health, Standard 01/10/2008

Revascularisation percutaneous coronary intervention time

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	359733
Registration status:	Health, Standard 01/10/2008
Definition:	The time when percutaneous coronary intervention is performed for subsequent restoration of blood flow.
Property group:	Service provision event

Relational attributes

Data Element Concepts implementing this Property:	Person—revascularisation percutaneous coronary intervention time Health, Standard 01/10/2008

Revenue

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 358088

Registration status: Housing assistance, Standardisation pending 30/11/2007
Health, Standard 05/12/2007

Definition: Revenue is income that arises in the course of ordinary activities of an entity and is referred to by a variety of names including sales, fees, interest, dividends and royalties.

Property group: Financial characteristics

Source and reference attributes

Submitting organisation: Health Expenditure Advisory Committee

Origin: ABS 2003. Australian System of Government Finance Statistics: Concepts, Sources and Methods (Cat. no. 5514.0.55.001) EMBARGO: 11:30 AM (CANBERRA TIME) 10/10/2003.

METeOR identifier:	457283
Registration status:	Community Services, Standard 06/12/2011 Health, Standard 07/12/2011 Early Childhood, Standard 09/03/2012
Definition:	A designated region with a pre-determined population range primarily for statistical usage. Based on the Australian Statistical Geography Standard (ASGS) structure of six hierarchical statistical area levels comprised in ascending order. Each level directly aggregates to the level above. This principle continues up through the remaining levels of the hierarchy.

Systemic therapy agent or protocol

Identifying and definitional attributes

Metadata item type:	Property
METeOR identifier:	393613
Registration status:	Health, Standard 07/12/2011
Definition:	The systemic therapy agent or protocol used for treatment. Systemic therapy agents are drugs that travel through the bloodstream and reach and effect cells all over the body. They are administered orally or intravenously. Systemic therapy agents may be administered as single-agent treatments or as a combination of drugs administered according to a prespecified regimen or protocol. A protocol is a precise and detailed plan for therapy that includes the type, quantity, method and length of time of taking the drugs required for any treatment cycle. Systemic therapy agents are encompassed in the treatment modalities **chemotherapy**, **immunotherapy** and **hormone therapy** administered for the treatment of cancer.
Property group:	Service provision event

Systemic therapy procedure

Identifying and definitional attributes

Metadata item type: Property

METeOR identifier: 394647

Registration status: Health, Standard 07/12/2011

Definition: The type of systemic therapy procedure used in treatment.

A systemic therapy procedure is a medical, surgical or radiation procedure that has an effect on the hormonal or immunologic balance of the patient, and refers to haematologic transplant and endocrine procedures. Haematologic transplants are bone marrow or stem cell transplants performed to protect patients from myelosuppression or bone marrow ablation associated with the administration of high-dose chemotherapy or radiotherapy.

Endocrine therapy is cancer therapy that achieves its antitumour effect through the use of radiation or surgical procedures that suppress the naturally occurring hormonal activity of the patient (when the cancer occurs at another site) and, therefore, alter or affect the long-term control of the cancer's growth.

Classifications

Australian and New Zealand Standard Classification of Occupations, First edition, 2006

Identifying and definitional attributes

Metadata item type:	Classification Scheme
Synonymous names:	ANZSCO 1st edition
METeOR identifier:	350882
Registration status:	Community Services, Standard 27/03/2007 Health, Standard 04/07/2007
Definition:	The Australian Bureau of Statistics (ABS) classification for occupations.

Classification structure:

The structure of ANZSCO has five hierarchical levels - major group, sub-major group, minor group, unit group and occupation. The categories at the most detailed level of the classification are termed ‘occupations’. These are grouped together to form ‘unit groups’, which in turn are grouped into ‘minor groups’. Minor groups are aggregated to form ‘sub-major groups’ which in turn are aggregated at the highest level to form ‘major groups’.

These are the same hierarchical levels that are used in ASCO Second Edition and NZSCO 1999.

Conceptual model

ANZSCO is a skill-based classification used to classify all occupations and jobs in the Australian and New Zealand labour markets.

To do this, ANZSCO identifies a set of occupations covering all jobs in the Australian and New Zealand labour markets, defines these occupations according to their attributes and groups them on the basis of their similarity into successively broader categories for statistical and other types of analysis. The individual objects classified in ANZSCO are jobs.

In ANZSCO, occupations are organised into progressively larger groups on the basis of their similarities in terms of both skill level and skill specialisation.

The conceptual model adopted for ANZSCO uses a combination of skill level and skill specialisation as criteria to design major groups which are meaningful and useful for most purposes. The eight major groups are formed by grouping together sub-major groups using aspects of both skill level and skill specialisation. In designing the major groups, intuitive appeal and usefulness in both statistical and administrative applications were also important considerations.

The skill level criterion is applied as rigorously as possible at the second level of the classification, the sub-major group level, together with a finer application of skill specialisation than that applied at the major group level. Each sub-major group is made up of a number of minor groups.

Minor groups are distinguished from each other mainly on the basis of a finer application of skill specialisation than that applied at the sub-major group level. Within minor groups, unit groups are distinguished from each other on the basis of skill specialisation and, where necessary, skill level.

Virtually all unit groups are at one skill level. There are only eight unit groups which contain occupations at more than one skill level. In all but two of these unit groups, the vast majority of jobs classified to the unit group are at one skill level only. Data stored at unit group level can therefore be aggregated by skill level with a high degree of validity.

Within unit groups, the distinction between occupations amounts to differences between tasks performed in occupations. All occupations are at one skill level.

As a result, data classified at the major group level will provide only a broad indication of skill level. Data at the sub-major group level will provide a satisfactory indication of skill level for many analytical purposes. Data classified at the unit group level will provide an accurate indication of skill level. Unit groups can, therefore, be aggregated by skill level to provide an indicative measure of occupations classified by skill level.

Australian Classification of Health Interventions (ACHI) 7th edition

Identifying and definitional attributes

Metadata item type:	Classification Scheme
Synonymous names:	ACHI 7th edn
METeOR identifier:	391343
Registration status:	Health, Standard 22/12/2009
Definition:	The National Centre for Classification in Health classification of health interventions.
Classification structure:	ACHI is comprised of: • Tabular List of Interventions - contains seven character code in the format xxxxx-xx. Generally, the first five characters represent the MBS item number and the last two characters are allocated for each procedural concept derived from the MBS item description. Two appendices are specified: Mapping table; and ACHI codes listed in numerical order. • Alphabetic Index of Interventions - is an alphabetic index to the ACHI Tabular List of Interventions that contains many more procedural terms than those appearing in the ACHI Tabular List.

Definition: The Australian Bureau of Statistics (ABS) classification for the languages spoken by Australians.

Classification structure: The Australian Standard Classification of Languages (ASCL) has a three-level hierarchical structure.

Languages are grouped together into progressively broader categories on the basis of their evolution from a common ancestral language, and on the basis of geographic proximity of areas where a particular language originated.

Collection and usage attributes

Guide for use: The ASCL is intended for use in the collection, aggregation and dissemination of data relating to the language use of the Australian population, or subsets of the population.

Indexes in alphabetical and numerical order are available, see the *Origin:* attribute.

Definition: The Australian Bureau of Statistics framework for statistical geography. The main purpose of the Australian Statistical Geography Standard (ASGS) is the dissemination of geographically classified statistics. It provides a common framework of statistical geography which enables the publication of statistics that are comparable and spatially integrated.

Context: From July 2011, the ABS will progressively replace the current Australian Standard Geographical Classification (ASGC) with the Australian Statistical Geography Standard (ASGS) as its geographical framework.

Classification structure: The ASGS classification structures are split into two broads groups, the ABS Structures and the Non-ABS Structures.

The ABS Structures are hierarchies of regions defined and maintained by the ABS. The regions that comprise the ABS Structures will remain unchanged until the next Census of Population and Housing in 2016.

The Non-ABS Structures are hierarchies of regions which are not defined or maintained by the ABS, but for which the ABS is committed to providing a range of statistics. They generally represent administrative units such as Postcode and Local Government Areas.

The ABS Structures are built directly from mesh blocks. Non-ABS Structures are approximated by mesh blocks, the Statistical Areas Level 1 (SA1s), or the Statistical Areas Level 2 (SA2s).

The ABS Structures comprise six interrelated hierarchies of regions. They are:

- Main Structure
- Indigenous Structure
- Urban Centres and Localities/Section of State Structure
- Remoteness Area Structure
- Greater Capital City Statistical Area (GCCSA) Structure
- Significant Urban Area Structure.

The Non-ABS Structures comprise eight hierarchies of regions which are not defined or maintained by the ABS, but for which the ABS is committed to providing a range of statistics. They generally represent administrative regions and are approximated by mesh blocks, SA1s or SA2s. They are:

- Local Government Areas (LGAs)
- Postal Areas
- State Suburbs
- Commonwealth Electoral Divisions
- State Electoral Divisions
- Australian Drainage Divisions
- Natural Resource Management Regions
- Tourism Regions.

Identifying and definitional attributes

Metadata item type: Classification Scheme

Synonymous names: ICD-10-AM 7th edn

METeOR identifier: 391301

Registration status: Health, Standard 22/12/2009

Definition: The National Centre for Classification in Health classification of diseases and related health problems

Classification structure: ICD-10-AM is comprised of:

- Tabular List of Diseases - contains core three character codes with some expansion to four and five character codes. Two appendices are specified: Morphology of neoplasms; and Special tabulation lists for mortality and morbidity.
- Alphabetic Index of Diseases - consists of three sections: Section I is the index of diseases, syndromes, pathological conditions, injuries, signs, symptoms, problems and other reasons for contact with health services. Section II is the index of external causes of injury. The terms included here are not medical diagnoses but descriptions of the circumstances in which the violence occurred. Section III is the index of drugs and other chemical substances giving rise to poisoning or other adverse effects (also known as the Table of drugs and chemicals).

Source and reference attributes

Origin: National Centre for Classification in Health (NCCH) 2010. The International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM) – Seventh Edition - Tabular list of diseases and Alphabetic index of diseases. The Anatomical, Therapeutic, Chemical Classification System with Defined Daily Doses (ATC/DDD)

Identifying and definitional attributes

Metadata item type:	Classification Scheme
Synonymous names:	The ATC/DDD system
METeOR identifier:	334667
Registration status:	Health, Standard 07/12/2005
Definition:	The ATC/DDD system classifies therapeutic drug utilisation. The purpose of the ATC/DDD system is to serve as a tool for drug utilization research in order to improve quality of therapeutic drug use.
Classification structure:	In the ATC/DDD classification system, drugs are divided into different groups according to the organ or system on which they act and their chemical, pharmacological and therapeutic properties. Drugs are classified into five different levels. Drug consumption statistics (international and other levels) can be presented for each of these five levels.

Collection and usage attributes

Comments:	The Anatomical therapeutic classification (AT) was developed by the European Pharmaceutical Market Research Association (EPhMRA). The ATC/DDD system and the AT classification have the same origin, but are developed for different purposes. Comparative tables are available. The ATC classification used the International Nonproprietary Name (INN) whenever possible.

Source and reference attributes

Reference documents:	The Guidelines for ATC classification and DDD assignment were published for the first time in the current format in 1990. The Guidelines are published in all 3 languages in paper format only. The Index was published as a paper copy in the current format in 1990 for the first time. The Index is published in the following languages and formats: English (all available indexes), German (paper version only), Spanish (paper version only). An online searchable database is also available at http://www.whocc.no/atcddd/.
Revision status:	The system has been used for statistics since 1975.

Years between revisions - 1

Year of last revision - 2004

Latest revision number - 6 for the Guidelines in the current format, 13 for the Index in the current format.

Glossary items

Activity—functioning, disability and health

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Activity

METeOR identifier: 327296

Registration status: Community Services, Standard 01/03/2005
Health, Standard 29/11/2006

Definition: In the context of health, an activity is the execution of a task or action by an individual.

Context: 'Activities and participation' is one of three components that define the concept 'Disability', along with 'Body functions and structures' and 'Environmental factors'. 'Activities and participation' is also encompassed within the concept 'Functioning'.

The concept 'Activity', as defined here and as measured in the metadata item Activity difficulty level code (ICF) N, may be relevant to people and human services not related to disability.

Collection and usage attributes

Comments: Activity limitations are difficulties an individual has in the execution of an activity.

The performance of an activity is what the individual does in his or her current environment. The environment includes all aspects of the physical, social and attitudinal world. Activity limitation varies with the environment and is assessed in relation to a particular environment and in the absence or presence of assistance, including aids and equipment.

In time, a related and more generic data element may be developed. In the meantime, the addition of 'functioning, disability and health' to the concept of 'ability' indicates that the current concept is based on the concept and framework developed by World Health Organization to assist in the classification and description of functioning and disability, as contained in the ICF.

The ICF recognises two constructs that can be used with 'Activities and Participation': performance and capacity. 'Performance' is what the person does in their usual environment. 'Capacity' describes 'an individual's ability to execute a task or an action in a standardised environment, where a standardised environment may be:

- an actual environment commonly used for assessment in test settings; or
- in cases where this is not possible, an assumed environment which can be thought to have a uniform impact' (WHO 2001).

The standardised environment has not been generally operationalised. However, the recognition of these two constructs in the ICF underscores the importance of recording the environment in which activities are being performed.

This glossary item is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002). The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd Ed) ANN{.N[N} and Episode of care additional diagnosis, code (ICD-10-AM 3rd Ed) ANN{.N[N}.

Health, Standard 01/03/2005

Definition: The referential description of a location where an entity is located or can be otherwise reached or found.

Collection and usage attributes

Comments: The following attributes are commonly used in the formation of a full address:

- Address line; (address line is a composite data element containing many attributes of the specific location of a full address - see the current version of the Address line metadata item for further description and a list of its components for addresses located in Australia)
- Address type
- Australian state/territory identifier
- Country identifier
- Non-Australian State/province
- Postal delivery point identifier
- Postcode - Australian
- Postcode - international
- Suburb/town/locality

Some attributes of an address, located within Australia, also provide the elements to determine the **Statistical Local Are**a (SLA). This enables:

- comparison of the use of services by persons residing in different geographical areas,
- characterisation of catchment areas and populations for facilities for planning purposes, and
- documentation of provision of services to clients who reside in other states or territories. The address is also a relevant element in the unambiguous identification of a Health Care Client and a Health Care Provider.

METeOR identifier: 327206

Registration status: Health, Standard 01/03/2005

Definition: Admission is the process whereby the hospital accepts responsibility for the patient's care and/or treatment. Admission follows a clinical decision based upon specified criteria that a patient requires same-day or overnight care or treatment. An admission may be formal or statistical.

Formal admission:

The administrative process by which a hospital records the commencement of treatment and/or care and/or accommodation of a patient.

Statistical admission:

The administrative process by which a hospital records the commencement of a new episode of care, with a new care type, for a patient within one hospital stay.

Context: Admitted patient care

Collection and usage attributes

Comments: This treatment and/or care provided to a patient following admission occurs over a period of time and can occur in hospital and/or in the person's home (for hospital-in-the-home patients).

Admitted patient mental health care service

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	409067
Registration status:	Health, Standard 07/12/2011
Definition:	An admitted patient mental health care service is a specialised mental health service that provides overnight care in a psychiatric hospital or a specialised mental health unit in an acute hospital. Psychiatric hospitals and specialised mental health units in acute hospitals are establishments devoted primarily to the treatment and care of admitted patients with psychiatric, mental or behavioural disorders. These services are staffed by health professionals with specialist mental health qualifications or training and have as their principal function the treatment and care of patients affected by mental disorder/illness.
Context:	Specialised admitted patient mental health services.

Adoption

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327208

Registration status: Community Services, Standard 01/03/2005
Health, Standard 01/03/2005

Definition: Adoption is the legal process by which a person legally becomes a child of the adoptive parents and legally ceases to be a child of his/her existing parents.

Context: Children and family services.

Collection and usage attributes

Comments: The adoption order severs the legal relationship between the biological parents and the child. A new birth certificate is issued to the child bearing the name(s) of his/her adoptive parent(s) as the natural parent(s) and the new name of the child, where a change has occurred.

Ambulatory mental health care service

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 409081

Registration status: Health, Standard 07/12/2011

Definition: An ambulatory mental health care service is a specialised mental health service that provides services to people who are not currently admitted to a mental health admitted or residential service. Services are delivered by health professionals with specialist mental health qualifications or training. Ambulatory mental health services include:

- community-based crisis assessment and treatment teams,
- day programs,
- mental health outpatient clinics provided by either hospital or community-based services,
- child and adolescent outpatient and community teams,
- social and living skills programs,
- psychogeriatric assessment services,
- hospital-based consultation-liaison and in-reach services to admitted patients in non-psychiatric and hospital emergency settings,
- ambulatory-equivalent same day separations,
- home based treatment services,
- hospital based outreach services.

Context: Specialised ambulatory mental health services.

Antenatal care visit

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 461257

Registration status: Health, Standard 12/10/2011

Definition: An intentional encounter between a pregnant woman and a midwife or doctor to assess and improve maternal and fetal well-being throughout pregnancy and prior to labour.

Context: An antenatal care visit may occur in the following clinical settings:

- antenatal outpatients clinic
- specialist outpatient clinic
- general practitioner surgery
- obstetrician private room
- community health centre
- rural and remote health clinic
- independent midwife practice setting including home of pregnant female

Assistance with activities and participation

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	327298
Registration status:	Community Services, Standard 01/03/2005 Health, Standard 29/11/2006
Definition:	The help that a person receives or needs from another person, because of their difficulty in performing an activity or in participating in an area of life.

Context:

'Assistance' is an important subset of Environmental factors that may facilitate (or hinder) the activities or participation of people with disability. Assistance is a key policy and service component in the disability and aged care services field in Australia. Further, it is recognised in the ICF as a crucial factor whose presence (or absence) must be noted when recording measures of functioning and disability.

Recording measures of assistance needed or provided will provide further information about activity limitations.

Collection and usage attributes

Comments:

The concept can be used to describe aspects of the environment. Depending on which environment is present or being considered, the measure of assistance indicates what assistance is currently received (in the current or usual environment) and what would be needed (in an optimum environment). 'Need' more generally relates to environmental factors (including personal assistance, equipment and environmental modifications) that are present in an optimum environment but not in the person's current environment. That is, changes may be needed to environmental factors in order to improve a person's functioning and reduce their disability. While these ideas apply generally to 'Environmental Factors' and the related metadata item, Extent of environmental factors influence code [X]N, the concept of 'Assistance' focuses solely on the factor of personal assistance.

Measures of assistance and need for assistance are under active development in a number of disciplines and service programs. Assistance may be measured in various ways, for instance in relation to duration, frequency and intensity of assistance. Related data elements are therefore likely to emerge in the future.

This glossary item is based on the International Classification of Functioning, Disability and Health (ICF).

The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd Ed) ANN{.N[N} and Episode of care additional diagnosis, code (ICD-10-AM 3rd Ed) ANN{.N[N}.

Average for the counting period

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	373642
Registration status:	Health, Standard 03/12/2008
Definition:	The average for the counting period is calculated by summing all the individual counts and dividing it by the number of periods for which a count was taken. For the reporting year, if a count was taken n times, the average is calculated as the SUM (Count1 + Count2 + ...Countn) DIVIDED by n. A reporting year is a financial year. It begins on 1 July and ends on 30 June of the following year.

Birthweight

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327212

Registration status: Health, Standard 01/03/2005

Definition: The first weight of the fetus or baby obtained after birth. The World Health Organization further defines the following categories:

- extremely low birthweight: less than 1,000 grams (up to and including 999 grams),
- very low birthweight: less than 1,500 grams (up to and including 1,499 grams),
- low birthweight: less than 2,500 grams (up to and including 2,499 grams).

Context: Perinatal

Collection and usage attributes

Comments: The definitions of low, very low, and extremely low birthweight do not constitute mutually exclusive categories. Below the set limits they are all-inclusive and therefore overlap (i.e. low includes very low and extremely low, while very low includes extremely low).

For live births, birthweight should preferably be measured within the first hour of life before significant postnatal weight loss has occurred. While statistical tabulations include 500 gram groupings for birthweight, weights should not be recorded in those groupings. The actual weight should be recorded to the degree of accuracy to which it is measured.

Body functions

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327294

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: Body functions are the physiological functions of body systems (including psychological functions).

Collection and usage attributes

Guide for use: Body functions are organised according to body systems. The term 'body' refers to the human organism as a whole and includes mental or psychological functions.
Body functions are classified in neutral terms. To indicate that there is a problem with a body function requires the use of the impairment extent code to denote the extent or magnitude of the problem together with the body functions code.

Comments: This glossary item is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of the ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd ed) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd ed) ANN{.N[N]}.

Cessation of treatment episode for alcohol and other drugs

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	327302
Registration status:	Health, Standard 01/03/2005
Definition:	Cessation of a treatment episode occurs when treatment is completed or discontinued; or there has been a change in the principal drug of concern, the main treatment type, or the treatment delivery setting.
Context:	Alcohol and other drug treatment services

Collection and usage attributes

Guide for use:

A client is identified as ceasing a treatment episode if one or more of the following apply:

- their treatment plan is completed,
- they have had no contact with the treatment provider for a period of three months, nor is there a plan in place for further contact,
- their principal drug of concern for alcohol and other drugs has changed,
- their main treatment type for alcohol and other drugs has changed,
- their treatment delivery setting for alcohol and other drugs has changed,
- their treatment has ceased for other reasons (e.g. imprisoned, ceased treatment against advice, transferred to another service provider, died, etc.).

Metadata item type:	Glossary Item
METeOR identifier:	327220
Registration status:	Health, Standard 01/03/2005
Definition:	An intervention carried out to improve, maintain or assess the health of a person, in a clinical situation.
Context:	Health services: Information about the surgical and non-surgical interventions provides the basis for analysis of health service usage, especially in relation to specialised resources, for example theatres and equipment or human resources.

Collection and usage attributes

Comments:

Clinical interventions include invasive and non-invasive procedures, and cognitive interventions.

Invasive:

(a) Therapeutic interventions where there is a disruption of the epithelial lining generally, but not exclusively, with an implied closure of an incision (e.g. operations such as cholecystectomy or administration of a chemotherapeutic drug through a vascular access device);

(b) Diagnostic interventions where an incision is required and/or a body cavity is entered (e.g. laparoscopy with/without biopsy, bone marrow aspiration).

Non-invasive:

Therapeutic or diagnostic interventions undertaken without disruption of an epithelial lining (e.g. lithotripsy, hyperbaric oxygenation; allied health interventions such as hydrotherapy; diagnostic interventions not requiring an incision or entry into a body part such as pelvic ultrasound, diagnostic imaging).

Cognitive:

An intervention which requires cognitive skills such as evaluating, advising, planning (e.g. dietary education, physiotherapy assessment, crisis intervention, bereavement counselling).

Clinical review

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327214

Registration status: Health, Standard 01/03/2005

Definition: The examination of a patient by a clinician after the patient has been added to the elective care waiting list. This examination may result in the patient being assigned a different urgency rating from the initial classification. The need for clinical review varies with a patient's condition and is therefore at the discretion of the treating clinician.

Context: Admitted patient care.

Course of radiotherapy treatment

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	448151
Registration status:	Health, Standard 07/12/2011
Definition:	A series of one or more **radiotherapy** treatments prescribed by a radiation oncologist.

Collection and usage attributes

Comments:

A course of radiotherapy treatment should have an associated ready-for-care date and, when treatment starts, a radiotherapy start date.

A patient can receive more than one course of radiotherapy treatment at the same time (i.e. courses which are simultaneous or which overlap). These courses may have the same or different ready-for-care dates and the same or different radiotherapy start dates.

Only a radiation oncologist can prescribe a course of radiotherapy treatment. A prescription is not equal to a course of radiotherapy treatment. A prescription may be for one or more courses of radiotherapy treatment. A prescription outlines the anatomical region/sites to be treated and is for a prescribed dose at a defined volume (fractionation) over a defined period of time.

One course of radiotherapy treatment may cover multiple phases and multiple treatment plans.

The completion of a course of radiotherapy treatment is not relevant to the definition of a course of radiotherapy treatment.

Diagnosis

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327224

Registration status: Health, Standard 01/03/2005

Definition: A diagnosis is the decision reached, after assessment, of the nature and identity of the disease or condition of a patient or recipient of residential care (resident).

Context: Health services:

Diagnostic information provides the basis for analysis of health service usage, epidemiological studies and monitoring of specific disease entities.

Collection and usage attributes

Comments: Classification systems which enable the allocation of a code to the diagnostic information:

- International Classification of Diseases, Tenth Revision, Australian Modification (ICD-10-AM),
- British Paediatric Association Classification of Diseases,
- North America Nursing Diagnosis Association,
- International Classification of Primary Care International,
- Classification of Impairments, Disabilities and Handicaps,
- International Classification of Functioning.

Disability

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327304

Registration status: Community Services, Standard 01/03/2005
Housing assistance, Standard 01/03/2005
Health, Standard 29/11/2006

Definition: Disability is the umbrella term for any or all of: an impairment of body structure or function, a limitation in activities, or a restriction in participation.

Disability is a multi-dimensional and complex concept and is conceived as a dynamic interaction between health conditions and environmental and personal factors (WHO 2001:6).

Collection and usage attributes

Comments: Many different 'definitions' of disability are used in Australia, both in administrative data collections and in Acts of Parliament. The consistent identification of disability in national data collections has been recommended in a number of reports, for instance to enable:

- the monitoring of access to generic services by people with disability;
- the collection of more consistent data on disability support and related services, including data on service use by different groups;
- population data and service data to be related, thereby improving the nation's analytical capacity in relation to the need for and supply of services; and
- improved understanding of the relationship between disability, health conditions and other health outcomes.

Defining disability makes it possible to determine the number of people who are accessing services, both disability specific and generic, and also those with a disability in the general population with unmet need. Better definition of disability will aid better targeting of resources to those in need.

Disability arises from the interaction between health conditions and environmental and personal factors. A health condition may be a disease (acute or chronic), disorder, injury or trauma. Environmental factors make up the physical, social and attitudinal environment in which people live and conduct their lives. Personal factors relate to the individual, such as age, sex and Indigenous status.

The concept 'Disability' can be described using a combination of related metadata items as building blocks.

The metadata items selected may vary depending on the definition of disability used. For example, in hospital rehabilitation, the focus may be on the impairment and **activity** dimensions and in community-based care the focus may be primarily on participation. Some applications may require a broad scope for inclusion (e.g. discrimination legislation). Data collections relating to services will select combinations of the data elements, which best reflect the eligibility criteria for the service.

This glossary item is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd Edn) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd Edn) ANN{.N[N]}.

Emergency department - public hospital

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327228

Registration status: Health, Standard 01/03/2005

Definition: The dedicated area in a public hospital that is organised and administered to provide emergency care to those in the community who perceive the need for or are in need of acute or urgent care.

The emergency department must be part of a hospital and be licensed or otherwise recognised as an emergency department by the appropriate state or territory authority.

An emergency department provides triage, assessment, care and/or treatment for patients suffering from medical condition(s) and/or injury.

Context: Emergency department care.

Collection and usage attributes

Comments: This glossary term has been defined to support the National Minimum Data Set - Non-admitted patient emergency department care. It is not intended as a definitive statement of the role or purpose of an emergency department.

The national definition of an emergency department and the care that is provided in an emergency department is characterised by jurisdictional and local differences. For example, there is no national agreement on the identification and classification of emergency department-related settings such as observation units, short stays units, or the use of 'admitted patient beds' located in an emergency department setting.
Emergency department is therefore defined as a concept, and not necessarily as a physical premises, setting or site.

Source and reference attributes

Environmental factors

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327286

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: Environmental factors make up the physical, social and attitudinal environment in which people live and conduct their lives.

Context: Environmental factors are external to the individual and can have a positive or negative influence on a person's participation as a member of society, on performance of activities, or on a person's body function or structure.

Collection and usage attributes

Guide for use: In the ICF classification scheme Environmental factors are organised to focus on two different levels, individual and societal. Environmental factors interact with the Body structures/Body functions and Activities and participation components.
A person's functioning and disability is conceived as the dynamic interaction between health conditions and environmental and personal factors.

Comments: This glossary item is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]}.

Episode of acute care

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Acute care episode for admitted patients

METeOR identifier: 327230

Registration status: Health, Standard 01/03/2005

Definition: An episode of acute care for an admitted patient is one in which the principal clinical intent is to do one or more of the following:

- manage labour (obstetric),
- cure illness or provide definitive treatment of injury,
- perform surgery,
- relieve symptoms of illness or injury (excluding palliative care),
- reduce severity of illness or injury,
- protect against exacerbation and/or complication of an illness and/or injury which could threaten life or normal functions,
- perform diagnostic or therapeutic procedures.

Context: Admitted patient care.

Functioning

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327292

Registration status: Community Services, Standard 01/03/2005
Health, Standard 29/11/2006

Definition: Functioning is the umbrella term for any or all of: body functions, body structures, activities and participation. Functioning is a multidimensional concept denoting the neutral aspects of the interaction between an individual (with a health condition) and that individual's environmental and personal factors.

Context: An individual's functioning in a specific domain is an interaction or complex relationship between health conditions and environmental and personal factors.

Functioning and disability are dual concepts in a broad framework, with disability focussing on the more negative aspects of this interaction.

Collection and usage attributes

Comments: This glossary term is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an 'umbrella term for disease (acute or chronic), disorder, injury or trauma' (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]}.

Geographic indicator

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327306

Registration status:
Community Services, Standard 01/03/2005
Housing assistance, Standard 22/10/2005
Health, Standard 01/03/2005
Homelessness, Standard 22/10/2005

Definition: A classification scheme that divides an area into mutually exclusive sub-areas based on geographic location.

Some geographic indicators are:

- Australian Standard Geographical Classification (ASGC, ABS Cat No. 1216.0),
- administrative regions,
- electorates,
- Accessibility/Remoteness Index of Australia (ARIA),
- Rural, Remote and Metropolitan Area Classification (RRMA), and
- country.

Context: To enable the analysis of data on a geographical basis. Facilitates analysis of service provision in relation to demographic and other characteristics of the population of a geographic area.

Collection and usage attributes

Comments: Person (address)—Australian postcode (Postcode datafile), code [NNNN] is not included in the above listing, as it is, strictly speaking, not a geographic indicator. Sometimes postcodes are used in the analysis of data on a geographical basis, which involves a conversion to Statistical Local Area (an Australian Bureau of Statistics geographical structure). This conversion results in some inaccuracy of information. However, in some data sets Person (address)—Australian postcode (Postcode datafile), code [NNNN]; is the only geographic identifier, therefore the use of other more accurate indicators (for example, conversion from address line to Statistical Local Area) is not always possible.

Hospital boarder

Identifying and definitional attributes

Metadata item type:	Glossary Item
Synonymous names:	Boarder
METeOR identifier:	327242
Registration status:	Health, Standard 01/03/2005
Definition:	A person who is receiving food and/or accommodation but for whom the hospital does not accept responsibility for treatment and/or care.
Context:	Admitted patient care.

Collection and usage attributes

Guide for use:	A boarder thus defined is not admitted to the hospital. However, a hospital may register a boarder. Babies in hospital at age 9 days or less cannot be boarders. They are admitted patients with each day of stay deemed to be either a qualified or unqualified day.

Hospital-in-the-home care

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	327308
Registration status:	Health, Standard 01/03/2005
Definition:	Provision of care to hospital admitted patients in their place of residence as a substitute for hospital accommodation. Place of residence may be permanent or temporary.
Context:	Admitted patient care.

Collection and usage attributes

Comments:

The criteria for inclusion as hospital-in-the-home include but are not limited to:

- without hospital in the home care being available patients would be accommodated in the hospital,
- the treatment forms all or part of an episode of care for an admitted patient (as defined in the metadata item Admitted patient),
- the hospital medical record is maintained for the patient,
- there is adequate provision for crisis care.

Selection criteria for the assessment of suitable patients include but are not limited to:

- the hospital deems the patient requires health care professionals funded by the hospital to take an active part in their treatment,
- the patient does not require continuous 24 hour assessment, treatment or observation,
- the patient agrees to this form of treatment,
- the patient's place of residence is safe and has carer support available,
- the patient's place of residence is accessible for crisis care,
- the patient's place of residence has adequate communication facilities and access to transportation.

Illicit drug

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Illegal drug

METeOR identifier: 413485

Registration status: Community Services, Standard 06/02/2012
Health, Recorded 15/09/2010

Definition: An illicit drug is defined as any drug which is illegal to possess or use or any legal drug used in an illegal manner, for example:

- a drug obtained on prescription but given or sold to another person to use
- glue or petrol which is sold legally, but is used in a manner that is not intended, such as inhaling fumes
- stolen pharmaceuticals sold on the black market (e.g. Pethidine)

Collection and usage attributes

Comments: The 2007 National Drug Strategy Household Survey report defines illicit drugs as illegal drugs (such as marijuana/cannabis), prescription or over-the-counter pharmaceuticals (such as analgesics/pain-killers or tranquillisers/sleeping pills) used for illicit purposes, and other substances used inappropriately (such as naturally occurring hallucinogens and inhalants).

Impairment of body structure

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327288

Registration status: Community Services, Standard 16/10/2006
Health, Standard 29/11/2006

Definition: Impairments of body structure are problems in body structure such as a loss or significant departure from population standards or averages.

Context: Body structures are classified in ICF in neutral terms. To indicate that there is a problem with a body structure requires the use of the body structures code for the structure affected and the impairment extent code to denote the extent or magnitude of the problem.
The impairment nature and impairment location codes can be used to expand the description of a problem with a body structure.

Source and reference attributes

Origin: World Health Organization (WHO) 2001. International Classification of Functioning, Disability and Health. Geneva: WHO

Australian Institute of Health and Welfare (AIHW) 2003. ICF Australian User Guide Version 1.0. Canberra: AIHW

Comments

This glossary term is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).
The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an ‘umbrella term for disease (acute or chronic), disorder, injury or trauma’ (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]}.

Intensive care unit

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327234

Registration status: Health, Standard 01/03/2005

Definition: An intensive care unit (ICU) is a designated ward of a hospital which is specially staffed and equipped to provide observation, care and treatment to patients with actual or potential life-threatening illnesses, injuries or complications, from which recovery is possible. The ICU provides special expertise and facilities for the support of vital functions and utilises the skills of medical, nursing and other staff trained and experienced in the management of these problems.

Context: Admitted patient care.

Collection and usage attributes

Comments: There are five different types and levels of ICU defined according to three main criteria: the nature of the facility, the care process and the clinical standards and staffing requirements. All levels and types of ICU must be separate and self-contained facilities in hospitals and, for clinical standards and staffing requirements, substantially conform to relevant guidelines of the Australian Council on Healthcare Standards (ACHS). The five types of ICU are briefly described below:

- Adult intensive care unit, level 3: must be capable of providing complex, multisystem life support for an indefinite period; be a tertiary referral centre for patients in need of intensive care services and have extensive backup laboratory and clinical service facilities to support the tertiary referral role. It must be capable of providing mechanical ventilation, extracorporeal renal support services and invasive cardiovascular monitoring for an indefinite period; or care of a similar nature.
- Adult intensive care unit, level 2: must be capable of providing complex, multisystem life support and be capable of providing mechanical ventilation, extracorporeal renal support services and invasive cardiovascular monitoring for a period of at least several days, or for longer periods in remote areas or care of a similar nature (see ACHS guidelines).
- Adult intensive care unit, level 1: must be capable of providing basic multisystem life support usually for

less than a 24-hour period. It must be capable of providing mechanical ventilation and simple invasive cardiovascular monitoring for a period of at least several hours; or care of a similar nature.

- Paediatric intensive care unit: must be capable of providing complex, multisystem life support for an indefinite period; be a tertiary referral centre for children needing intensive care; and have extensive backup laboratory and clinical service facilities to support this tertiary role. It must be capable of providing mechanical ventilation, extracorporeal renal support services and invasive cardiovascular monitoring for an indefinite period to infants and children less than 16 years of age; or care of a similar nature.
- Neonatal intensive care unit, level 3: must be capable of providing complex, multisystem life support for an indefinite period. It must be capable of providing mechanical ventilation and invasive cardiovascular monitoring; or care of a similar nature. Definitions for high-dependency unit and coronary care unit are under development.

Mental health-funded non-government organisation

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327446

Registration status: Health, Standard 07/12/2005

Definition: A private organisation that receives Australian Government and/or State/Territory funding specifically for the provision of community health and related support and information services for people with a mental disorder or psychiatric disability, their carers or the broader community. These include accommodation, advocacy, community awareness, health promotion, counselling, independent living skills, psychosocial, recreation, residential, respite and self-help services.

Collection and usage attributes

Comments: Mental health funded non-government organisations may also provide other services that are not related to mental health programs or activities, and/or undertake mental health research.

Mental health-funded non-government organisations are usually not-for-profit, but can include for-profit organisations.

Neonate

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327284

Registration status: Health, Standard 01/03/2005

Definition: A live birth who is less than 28 days old.

Context: Perinatal.

Collection and usage attributes

Comments: The neonatal period is exactly four weeks or 28 completed days, commencing on the date of birth (day 0) and ending on the completion of day 27. For example, a baby born on 1 October remains a neonate until completion of the four weeks on 28 October and is no longer a neonate on 29 October.

Newborn qualification status

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327254

Registration status: Health, Standard 01/03/2005

Definition: Qualification status indicates whether the patient day within a newborn episode of care is either qualified or unqualified.

Context: Admitted patient care: To provide accurate information on care provided in newborn episodes of care through exclusion of unqualified patient days.

Collection and usage attributes

Guide for use: A newborn qualification status is assigned to each patient day within a newborn episode of care.

A newborn patient day is qualified if the infant meets at least one of the following criteria:

- is the second or subsequent live born infant of a multiple birth, whose mother is currently an admitted patient,
- is admitted to an intensive care facility in a hospital, being a facility approved by the Commonwealth Minister for the purpose of the provision of special care,
- is admitted to, or remains in hospital without its mother.

A newborn patient day is unqualified if the infant does not meet any of the above criteria.

The day on which a change in qualification status occurs is counted as a day of the new qualification status.

If there is more than one qualification status in a single day, the day is counted as a day of the final qualification status for that day.

Comments: All babies born in hospital are admitted patients.

The newborn baby's qualified days are eligible for health insurance benefits purposes and the patient day count under the Australian Health Care Agreements. In this context, newborn qualified days are equivalent to acute days and may be denoted as such.

The days when a newborn baby does not meet these criteria are classified as unqualified (if they are nine days old or less) and should not be counted as patient days under the Australian Health Care Agreements and are not eligible for health insurance benefit purposes.

Organ procurement - posthumous

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	327258
Registration status:	Health, Standard 01/03/2005
Definition:	Organ procurement - posthumous is an activity undertaken by hospitals in which human tissue is procured for the purpose of transplantation from a donor who has been declared brain dead.
Context:	Hospital activity.

Collection and usage attributes

Comments:

This activity is not regarded as care or treatment of an admitted patient, but is registered by the hospital. Diagnoses and procedures undertaken during this activity, including mechanical ventilation and tissue procurement, are recorded in accordance with the Australian coding standards.

Declarations of brain death are made in accordance with relevant state/territory legislation.

Outpatient clinic service

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 336980

Registration status: Health, Standard 04/07/2007

Definition: An examination, consultation, treatment or other service provided in an outpatient setting in a specialty unit or under an organisational arrangement administered by a hospital.

Context: Non-admitted patient service activity, excluding emergency department. Does not include services provided through community health settings (such as community and child health centre).

Collection and usage attributes

Guide for use: This glossary item relates to activity of a clinic. See the Outpatient care National Minimum Data Set Scope statement for observations about use of the term 'clinic' in hospitals.

Source and reference attributes

Submitting organisation: Non-admitted patient NMDS Development Working Party, 2006

Overnight-stay patient

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327256

Registration status: Health, Standard 01/03/2005

Definition: A patient who, following a clinical decision, receives hospital treatment for a minimum of one night, i.e. who is admitted to and separated from the hospital on different dates.

Context: Admitted patient care

Collection and usage attributes

Comments: An overnight-stay patient in one hospital cannot be concurrently an overnight-stay patient in another hospital, unless they are receiving contracted care. If not under a hospital contract, a patient must be separated from one hospital and admitted to the other hospital on each occasion of transfer.

An overnight-stay patient of a hospital (originating hospital) who attends another hospital (the destination hospital) on a contracted basis is to be regarded by the originating hospital as an overnight-stay patient, as if the patient had not left for contracted hospital care.

Treatment provided to an intended same-day patient who is subsequently classified as an overnight-stay patient is regarded as part of the overnight episode.

A non-admitted (emergency/outpatient) service provided to a patient who is subsequently classified as an admitted patient shall be regarded as part of the admitted episode. Any occasion of service should be recorded and identified as part of the admitted patient's episode of care.

Patients who leave of their own accord, die or are transferred on their first day in hospital are not overnight-stay patients.

Palliative care agency

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 356474

Registration status: Health, Standard 05/12/2007

Definition: A palliative care agency is an organisation or organisational sub-unit that provides specialist palliative care and receives Australian or state/territory government funding (including Australian Health Care Agreement funding), or does not provide specialist palliative care but receives Australian Health Care Agreement funding to provide care incorporating a palliative approach or palliative care-related services.

Collection and usage attributes

Guide for use: 'Specialist palliative care' services work substantively in the area of palliative care they would usually provide consultative and ongoing care for people with a life-limiting illness and provide support for primary carers and family members, provide multi-disciplinary healthcare and employ healthcare professionals who have qualifications or experience in palliative care.

Care may be provided in admitted patient and/or community settings. Community settings include outpatient facilities.

A palliative care agency represents the level of an organisation that is responsible for the care provided to clients (i.e. care coordination) regardless of whether the agency provides this care directly or purchases the care on behalf of clients.

Participation - functioning, disability and health

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Participation

METeOR identifier: 327312

Registration status: Community Services, Standard 06/06/2005
Health, Standard 29/11/2006

Definition: In the context of health, participation is involvement in a life situation.

Context: Involvement refers to the lived experience of people in the actual context in which they live. This context includes 'Environmental Factors' - all aspects of the physical, social and attitudinal world.

The individual's degree of involvement can be reflected by this glossary item when combined with Participation extent code (ICF 2001) X and Participation satisfaction level code X.

'Activities and participation' is one of three components that define the concept 'Disability', along with 'Body functions and structures' and 'Environmental factors'. 'Activities and participation' is also encompassed within the concept 'Functioning'.

The concept 'Participation', as defined here and as measured in the metadata items Participation extent code (ICF 2001) X and Participation satisfaction level code X, may be relevant to people and human services not related to disability.

Collection and usage attributes

Comments: Participation restrictions are problems an individual may experience in involvement in life situations.

In time, a related and more generic data element may be developed. In the meantime, the addition of 'functioning, disability and health' to the name of this glossary item indicates that the current concept is based on the concept and framework developed by World Health Organization to assist in the classification and description of functioning and disability, as contained in the International Classification of Functioning, Disability and Health (ICF).

This glossary item is based on the International Classification of Functioning, Disability and Health (ICF). The ICF was endorsed by the World Health Assembly in 2001 as a reference member of the WHO Family of International Classifications and of the Australian Family of Health and Related Classifications (endorsed by the National Health Information Management Group in 2002).

The ICF provides a framework for the description of human functioning and disability. The components of ICF are defined in relation to a health condition. A health condition is an ‘umbrella term for disease (acute or chronic), disorder, injury or trauma’ (WHO 2001). A health condition may be recorded, for example, as Episode of care principal diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]} and Episode of care additional diagnosis, code (ICD-10-AM 3rd edn) ANN{.N[N]}.

Record linkage

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327264

Registration status: Community Services, Standard 01/03/2005
Health, Standard 01/03/2005

Definition: A process, technique or method that enables the bringing together of two or more records that are believed to belong to the same individual.

Context: Record linkage may facilitate improved service provision, treatment or case management to individual clients.

Collection and usage attributes

Comments: Linkage can occur across data systems or within data systems and may be done by using a range of identifiers.

For statistical purposes, including planning, research or the measurement of service or program outcomes, record linkage facilitates separating multiple items clustered around individuals from total counts (for example, double counting of clients can be reduced when calculating total numbers of clients across several agencies).

The proposed use of a linkage key in the Home and Community Care program (HACC) Minimum Data Set is intended to make it possible to count the number of HACC clients (without counting clients more than once) and the services which they receive. The Commonwealth-State Territory Disability Agreement National Minimum Data Set is using the statistical linkage key based on that for the HACC Minimum Data Set.

Reserve

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 460218

Registration status: Health, Standard 07/12/2011

Definition: The dollar amount that is the best current estimate of the likely cost of a claim when closed.

Context: The reserve allows an insurer or self-insurer to monitor its potential financial liability with respect to a claim. The setting of a reserve marks an acknowledgement by an insurer or self-insurer that it may incur costs in closing a claim.

Collection and usage attributes

Comments: An insurer or self-insurer can obtain an estimate of its potential liability for finalising claims that are still open by adding up the outstanding reserve amounts for its claims that are still open. Accordingly, the reserve amounts set against open claims are important for an insurer or self-insurer in its budgeting and funds management.

Resident

Identifying and definitional attributes

Metadata item type:	Glossary Item
METeOR identifier:	327198
Registration status:	Health, Standard 01/03/2005
Definition:	A person who receives residential care intended to be for a minimum of one night.
Context:	Specialised mental health services (Residential mental health care).

Collection and usage attributes

Comments:	A resident in one residential mental health service cannot be concurrently a resident in another residential mental health service. A resident in a residential mental health service can be concurrently a patient admitted to a hospital.

Residential mental health care service

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 373049

Registration status: Health, Standard 02/12/2009

Definition: A residential mental health service is a service that is considered by the state, territory or commonwealth funding authorities as a service that:

- has the workforce capacity to provide specialised mental health services; and
- employs suitably trained mental health staff to provide rehabilitation, treatment or extended care on-site:

    to consumers residing on an overnight basis;

    in a domestic-like environment; and
- encourages the consumer to take responsibility for their daily living activities.

These services include those that employ mental health trained staff on-site 24 hours per day and other services with less intensive staffing (but the trained staff must be on site for a minimum of 6 hours a day and at least 50 hours per week).

Suitably trained residential mental health care staff may include:

- individuals with Vocational Education and Training (VET) qualifications in community services, mental health or disability sectors;
- individuals with tertiary qualifications in medicine, social work, psychology, occupational therapy, counselling, nursing or social sciences; and
- individuals with experience in mental health or disability relevant to providing mental health consumers with appropriate services.

Context: Specialised residential mental health services.

Revenue (other revenue)

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Other revenue

METeOR identifier: 357543

Registration status: Health, Standard 05/12/2007

Definition: All other revenue received by the establishment that is not included under patient revenue or recoveries (but not including revenue payments received from state or territory governments). This would include revenue such as investment income from temporarily surplus funds and income from charities, bequests and accommodation provided to visitors.

See text relating to offsetting practices. Gross revenue should be reported (except in relation to payments for inter-hospital transfers of goods and services).

Revenue (patient)

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: Patient revenue

METeOR identifier: 357539

Registration status: Health, Standard 05/12/2007

Definition: Patient revenue comprises all revenue received by, and due to, an establishment in respect of individual patient liability for accommodation and other establishment charges. All patient revenue is to be grouped together regardless of source of payment (Commonwealth, health fund, insurance company, direct from patient) or status of patient (whether inpatient or non-inpatient, private or compensable). Gross revenue should be reported.

Revenue (recoveries)

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 357541

Registration status: Health, Standard 05/12/2007

Definition: All revenue received that is in the nature of a recovery of expenditure incurred. This would include:

- income received from the provision of meals and accommodation to members of staff of the hospital (assuming it is possible to separate this from income from the provision of meals and accommodation to visitors);
- income received from the use of hospital facilities by salaried medical officers exercising their rights of private practice and by private practitioners treating private patients in hospital; and
- other recoveries such as those relating to inter-hospital services where the revenue relates to a range of different costs and cannot be clearly offset against any particular cost.

Generally, gross revenues should be reported but, where inter-hospital payments for transfers of goods and services are made, offsetting practices are acceptable to avoid double counting. Where a range of inter-hospital transfers of goods and services is involved and it is not possible to allocate the offsetting revenue against particular expenditure categories, then it is acceptable to bring that revenue in through recoveries.

Same-day patient

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327270

Registration status: Health, Standard 01/03/2005

Definition: A same-day patient is a patient who is admitted and separates on the same date, and who meets one of the following minimum criteria:

- that the patient receive same-day surgical and diagnostic services as specified in bands 1A, 1B, 2, 3, and 4 but excluding uncertified type C Professional Attention Procedures within the Health Insurance Basic Table as defined in s.4 (1) of the *National Health Act 1953* (Commonwealth),
- that the patient receive type C Professional Attention Procedures as specified in the Health Insurance Basic Table as defined in s.4 (1) of the *National Health Act 1953* (Commonwealth) with accompanying certification from a medical practitioner that an admission was necessary on the grounds of the medical condition of the patient or other special circumstances that relate to the patient.

Context: Admitted patient care.

Collection and usage attributes

Comments: Same-day patients may be either intended to be separated on the same day, or intended overnight-stay patients who left of their own accord, died or were transferred on their first day in the hospital.

Treatment provided to an intended same-day patient who is subsequently classified as an overnight-stay patient shall be regarded as part of the overnight episode.

Non-admitted (emergency or outpatient) services provided to a patient who is subsequently classified as an admitted patient shall be regarded as part of the admitted episode. Any occasion of service should be recorded and identified as part of the admitted patient's episode of care.

Data on same-day patients are derived by a review of admission and separation dates.

Separation

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 327268

Registration status: Health, Standard 01/03/2005

Definition: Separation is the process by which an episode of care for an admitted patient ceases. A separation may be formal or statistical.

Formal separation:

The administrative process by which a hospital records the cessation of treatment and/or care and/or accommodation of a patient.

Statistical separation:

The administrative process by which a hospital records the cessation of an episode of care for a patient within the one hospital stay.

Context: Admitted patient care.

Collection and usage attributes

Comments: This treatment and/or care provided to a patient prior to separation occurs over a period of time and can occur in hospital and/or in the person's home (for hospital-in-the-home patients).

While this concept is also applicable to non-Admitted patient care and welfare services, different terminology to 'separation' is often used in these other care settings.

Transgender

Identifying and definitional attributes

Metadata item type: Glossary Item

METeOR identifier: 398610

Registration status: Community Services, Standard 06/02/2012
Health, Standard 25/08/2011

Definition: A transgender person is a person who:

(a) identifies as a member of a different sex by living, or seeking to live, as a member of that sex; or

(b) has identified as a member of a different sex by living as a member of that sex; whether or not the person is a recognised transgender person.

Collection and usage attributes

Comments: A person's sex may change during their lifetime as a result of surgical procedures known alternatively as sex change, gender reassignment, transsexual surgery, transgender reassignment or sexual reassignment. Throughout this process, which may be over a considerable period of time, sex could be recorded as either male or female.

Urban Centre

Identifying and definitional attributes

Metadata item type: Glossary Item

Synonymous names: UC

METeOR identifier: 467399

Registration status: Health, Standard 07/12/2011

Definition: A population cluster of 1,000 or more people.

Context: Urban Centres, together with Localities, make up the Urban Centre/Locality (UC/L) structure maintained by the Australian Bureau of Statistics (ABS) as part of the Australian Standard Geographical Classification (ASGC).

A **Locality** is a population cluster of between 200 and 999 people. For statistical purposes, people living in Urban Centres are classified as urban while those in Localities are classified as rural.

Companion guide

What are the national data dictionaries?

The national data dictionaries contain standard data definitions and data elements for use in any Australian community services, health, or housing and homelessness data collection. The National Community Services Data Dictionary, the National Health Data Dictionary, and the National Housing Assistance Data Dictionary are the authoritative source of information about endorsed national metadata standards and provide the basis for consistent national collection and reporting. The national metadata standards are approved by the Australian Government and all state and territory relevant community services and health departments, as well as the Australian Bureau of Statistics (ABS) and the Australian Institute of Health and Welfare (AIHW). This work is funded under the auspices of the Community and Disability Services Ministers' Advisory Council (CDSMAC), the Australian Health Ministers' Advisory Council (AHMAC), and the Housing Ministers' Advisory Committee (HMAC).

Where possible, metadata standards in the dictionary are consistent with other national standard classifications to ensure overall comparability of national data. The ABS is the source of many key socioeconomic classifications used in data collections, for example, the Australian Standard Classification of Languages (ASCL), the Australian Standard Geographical Classification (ASGC) and the Australian and New Zealand Standard Classification of Occupations (ANZSCO).

The data dictionaries have been downloaded from METeOR, which is an online metadata registry for developing, registering and disseminating metadata based on the second edition of the international standard ISO/IEC 11179 Information Technology-Metadata registries in 2003 (ISO/IEC 11179:2003). For more information about METeOR, see the METeOR section on page 3566. The national community services and health data dictionaries are also available online at <http://meteor.aihw.gov.au>.

Governance

The national community services, health, and housing data dictionaries are, respectively, initiatives under the National Community Services Information Infrastructure Agreement; the National Health Information Agreement; and the National Housing and Homelessness Information Infrastructure Agreement.

Under these agreements, all parties agree to ensure that the collection, compilation and interpretation of national information are appropriate and carried out efficiently. This requires agreement on definitions, standards and rules for collecting information, and on guidelines for coordinating the access, interpretation and publication of national community services and health information.

Why use metadata standards?

Making data count

Metadata standards promote the quality, accuracy, interpretability, reliability, relevance, interchange ability, transparency, currency, accessibility, coherence and comparability of data and information.

Without metadata standards there is the potential for data to fail to measure what it is supposed to measure, or not be comparable across collections or over time.

Metadata standards enable consistent and comparable reporting of information about services, including describing what services are available, where they are located and how much they cost. Such standards also achieve consistency when reporting about people, for instance, who delivered a service and when, who received the service, and what happened to them as a result.

By making endorsed metadata standards readily available, users are assured that they can use these standards with confidence and that they will enable the maximum reuse of their data for future research: 'create once, use often'.

How are metadata standards developed?

Creating metadata standards is part of data development**.** Data development is the process of building a data set for a specific purpose. For example, one might wish to build a data set that supports research into cancer diagnoses, treatment and outcomes, or one that supports statistical reporting about the functioning of hospital emergency departments.

Data development demands a clear understanding of why the data are needed; for example, to underpin the design and evaluation of community services policy, or to assess the performance of services, or to support research into social inclusion.

It also requires an assessment of the practicalities of collecting the data. Building almost any data set will demand the assembly of data from multiple sources. Thus there must be an understanding of the diverse information systems from which data are drawn, and there must be an effort to apply or develop common standards for concepts, classifications, terminologies, data values and so on.

The quality of data, including its consistency and comparability, is enhanced when metadata standards are used to support the collection and use of a data set.

Metadata standards development process

Stage 1: Project proposal

A submission is made to the relevant data committee outlining:

- the purpose and scope of the project
- a business case for adoption
- details of national consultation, including the composition of the data working group, (comprising members with expertise in the subject area of the data development project)

- the nominated project manager responsible for managing the data development project
- expected time frames for completion of the data development project.

Stage 2: Data development

The project manager works with the AIHW's METeOR and Metadata Unit and the data working group to develop the metadata items that will be stored in the national metadata registry system, METeOR.

Data collected for national reporting purposes must be defined in a standardised way. The standard adopted for community services data is the International Standards Organisation's metadata registry standard (ISO/IEC 11179:2003).

For more information about the data development process, see the AIHW publication *A guide to data development*, available at: <http://www.aihw.gov.au/publications/index.cfm/title/10422>.

Stage 3: Metadata standards review

The AIHW's METeOR and Metadata Unit undertakes a quality assurance review of the proposed metadata standards. This involves assessing all metadata standards for issues such as technical integrity, compliance with ISO/IEC 11179 and consistency with other standards, and the clarity of the content.

During this stage, the project manager receives feedback, makes adjustments and reports back to the data working group if required.

Stage 4: Endorsement of metadata standards

Once a final metadata assessment has been conducted, and the METeOR and Metadata Unit has provided a certification of the quality of the metadata standards, the metadata is submitted to the relevant endorsing body for final endorsement as a national standard.

Registration status progression

The registration status is the value assigned to a metadata item as it progresses through the standards development and review process. The registration statuses in METeOR are:

Proposed

- A developer has submitted this item for consideration by the METeOR registrar.

Recorded

- The METeOR registrar has conducted an initial technical review and determined that the item meets basic quality criteria.

Candidate

- The item has been compliance checked by the METeOR registrar and is ready for further development or review by the data developer.

Standardisation pending

- The item has undergone a final compliance check by the METeOR registrar and the data working group has recommended the item to a registration authority for approval as a standard.

Standard

- The item has been endorsed by a registration authority as a national data standard.

Superseded

- A registration authority has superseded this item with another standard.

Retired

- The item has been nominated by registration authority as retired.

Not progressed

- The item will no longer be considered by the registrar, a data committee or a registration authority.

Who benefits from using metadata standards?

Information managers use standard formats and definitions to support the receipt, transfer, storage and management of data.

Program managers use data standards as the basis for describing information requests (that is, data required under formal service or funding agreements, and contracts); measuring service activity, client flows, client characteristics and service usage; understanding demand; better planning of services; describing unmet need (need comparability of population and survey data); and understanding ways to integrate service delivery, resulting in better targeting and usage of services and ultimately cost savings.

Researchers use data standards as the common language to support survey work, as well as to integrate data from other sources.

Policy makers need aggregated information for future policy, management and funding decisions, that is, information to support comparisons across jurisdictions, programs and sectors.

Statisticians use data standards for interpreting and analysing data, analysing results, linking data sets for statistical purposes, and carrying out time series analysis (over a period of time) and longitudinal studies (over a period of time within groups).

Metadata structure

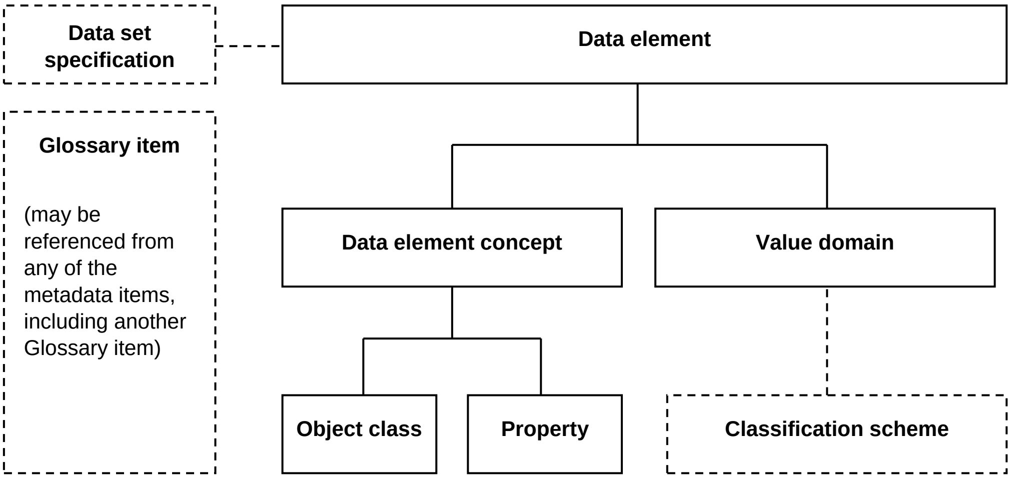
The metadata standards are based on the 2003 version of the ISO/IEC 11179 international standard for metadata registries. Part three of the standard is a model for a metadata registry and the formulation of metadata items.

There are six types of metadata defined by ISO/IEC 11179 that have been applied to METeOR and the data dictionaries:

- Object class
- Property
- Data element concept
- Data element
- Value domain
- Classification scheme.

The structure underlying a data element in the dictionary is illustrated in Figure 1.

Types of metadata



Data set specification
Data element
Glossary item
(may be referenced from any of the metadata items, including another Glossary item)
Data element concept
Value domain
Object class
Property
Classification scheme

Note: Dashed lines show metadata types that are additional to, or different from, the ISO/IEC standard.

Figure 1: The ISO/IEC 11179 model of metadata representation

Components of data elements

The things that we want to know about include ideas (knowledge), persons, organisations, the environment and events. These things are termed *Object classes*. Some examples of Object classes are ‘Person’, ‘Dwelling’ and ‘Service provider organisation’. A characteristic of the Object class is known as a *Property*. It is normally the item of interest. For example, the Object class ‘Person’ can have properties such as ‘Sex’ and ‘Date of birth’.

A *Data element concept* is defined as a concept created by the union of an Object class and a Property. Only one Object class and one Property can be joined for each Data element concept, for example, ‘Person—date of birth’.

As can be seen from Figure 1, a *Data element* is formed when a Data element concept is represented in the real world by a set of values (a *Value domain*).

A Value domain specifies how something is to be represented. A Value domain can specify:

- the range of permitted values, for example, a measure of weight in grams represented by three numeric characters
- all permissible values as a set of codes, for example, ‘Code 1 Female’, ‘Code 2 Male’
- the values referenced from a nationally or internationally endorsed classification, such as all codes in the Australian Standard Classification of Languages 2011, or all activity

codes listed in the International Statistical Classification of Diseases and Related Health Problems, 10th revision, Australian Modification, 7th edition.

A *Glossary item* defines the meaning of a term within a specific context. Examples of Glossary items include 'Adoption' and 'Family'. These are not currently defined as Object classes but their meaning must be clarified as part of the data development process.

Data set specifications

A data set specification (DSS) is a grouping of a number of Data elements and the conditions under which they are collected. A DSS defines:

- the scope of the collection, that is, the population that is the target of the data development
- the level at which the data will be collected and reported
- whether the inclusion of each Data element is mandatory, optional or conditional, and the sequence in which Data elements are included.

National minimum data sets

A national minimum data set (NMDS) is a type of DSS, made up of a minimum set of Data elements agreed by the national community services or health information groups for mandatory collection and reporting at a national level. An NMDS may include data elements that are also included in another NMDS.

An NMDS is contingent upon a national agreement to collect uniform data and to supply it as part of the national collection, but does not preclude agencies and service providers from collecting additional data to meet their own specific needs.

An example of an NMDS is the Juvenile Justice NMDS, which is used to obtain information about young people under juvenile justice supervision in Australia.

Non-mandatory data set specifications

DSSs are data sets that are not mandated for national collection and reporting, but are recommended as best practice.

For example, the Diabetes (clinical) Data Set Specification is a non-mandatory data set that aims to ensure national consistency in relation to defining, monitoring and recording information on patients diagnosed with diabetes.

Integration of data elements in data dictionaries

The national community services and health data dictionaries contain about 100 integrated data items that can be used consistently across the community services and health sectors. This is especially important for services that straddle sector boundaries, such as aged care, mental health, drug and alcohol services, and services for people with a disability.

Examples of integrated data items are:

Accuracy indicator, code AAA

Activity and participation life area, code (ICF 2001) AN[NNN]

Address line, text [X(180)]

Informal carer existence indicator, code N

Interpreter service required, yes/no code N

Labour force status, code N

Organisation name, text [X(200)]

Formulation of good data standards

1. **A metadata item must have, at least, a name and a definition.**
2. **A metadata item can have an explicitly stated context within which the definition has meaning.**
3. **The name of the standard version of the metadata item must follow certain criteria:**
   - the name must be unique within the context of the metadata item
   - the name must be stated in the singular
   - the name must reflect the concept being defined
   - the name must avoid the use of abbreviations or acronyms other than those widely accepted (for example radar, laser, pH)
   - the name should avoid the use of words that imply a preselected single instance.
4. **Definition rules and guidelines**

   A definition must:

   - be stated in the singular
   - state what the concept is, not only what it is not
   - be stated as a descriptive phrase or sentence(s)
   - contain only commonly understood abbreviations
   - be expressed without embedding definitions of other data or underlying concepts.

   A data definition should:

   - be expressed without embedding rationale, functional usage, domain information or procedural information
   - state the essential meaning of the concept
   - be precise and unambiguous
   - be concise
   - be able to stand alone
   - avoid circular reasoning
   - use the same terminology and consistent logical structure for related definitions
   - contain information appropriate for the type of metadata item being defined
   - use a preferred term to represent the definition of a concept specified elsewhere in the document
   - pass the substitution test.
5. **Context should be closely linked to definition.**

6. **Information must be included in a metadata item attribute only if it is appropriate for that attribute or metadata item.**

   - Context
     - Metadata can exist within a specific context.
     - Only information that is relevant to the environment or framework within which the definition for the metadata item is valid must be included in the Context attribute.
     - The contexts of two metadata items must be compatible when the definition of one metadata item references a term defined in another.
   - Guide for use information must be included in any metadata item only if it is intended to provide advice or interpretation on how to use the particular metadata item or data collected using the metadata item.
     - In metadata items other than Data elements, Guide for use information should be about how to use the item itself and not about any data that can be collected or used.
     - Data elements can also include information about how to use or interpret the data in the Guide for use.
   - The Collection methods attribute must only include information about how data is to be collected. The following metadata items must not have a metadata attribute of Collection methods:
     - Object class
     - Property
     - Data element concept
     - Value domain
     - Glossary item.
   - Permissible values in a Value domain must:
     - be exhaustive within the set
     - be made into an exhaustive set of values by adding an ‘Other’ to aggregate all other possibilities not covered by the stated set of values
     - be mutually exclusive within the set
     - be a true representation of the concept defined in the Data element.
   - When allocating code values:
     - avoid the use of a code value for ‘Other’ that is contiguous with the last code in the sequence of permissible values or that, in any other way, does not provide for inclusions in the future
     - wherever possible, avoid the use of a coded value for ‘Other’ that may be commonly used as a Supplementary value.
   - Supplementary values
     - Supplementary values must not be included in a Value domain unless it is necessary.
     - Do not include valid permissible values in the Supplementary values attribute of a Value domain.
     - Avoid the use of values that are contiguous with the last code in the permissible value sequence.

- To limit variations in the meaning within a specific data collection, use a default Supplementary value meaning of 'Not stated/inadequately described'.
- When using more than one Supplementary value, use a logical set.
- It is appropriate that the Supplementary value field size is the same number of characters as the permissible value.
- Consistent use of Supplementary codes/values across the Data elements in a data set should be applied.
- In non-enumerated Value domains (that is, those without defined value meanings, such as in a measurement) the Supplementary value used should not be a valid permissible value.

7. **Always use a standard format for referencing publications and not a mixture of referencing methods.**

METeOR

METeOR is the AIHW's online metadata registry.

It integrates and presents information about:

- the National Community Services Data Dictionary
- the National Health Data Dictionary
- the National Housing Assistance Data Dictionary
- national minimum data sets
- data set specifications
- performance indicator specifications.

It includes:

- data search and browse tools that allow navigation of data standards of varying levels of endorsement and across the community services, health and housing assistance sectors
- data view, collation and download tools
- data development tools, including areas in which multiple data developers may collaborate on the development of data standards
- data submission tools that enable data developers to submit draft metadata standards for consideration as national standards
- data management tools that allow the registrar to change the registration status of metadata standards under authorisation of one or more registration authorities
- comprehensive guidelines for developing and reviewing metadata.

METeOR is based on the 2003 version of the ISO/IEC 11179, Information Technology—Metadata registries. This standard was applied to provide a detailed registry architecture in which metadata standards can be better defined, navigated and managed throughout the data development lifecycle. METeOR is an internet-based application accessible through the web address <http://meteor.aihw.gov.au>.

Data Element Technical Names

Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service service provider type, occupation code (ANZSCO 1st edition) N[NNN]{NN} 85

Establishment (prison)—Aboriginal community controlled health organisation or Aboriginal medical service visitation frequency, code N 87

Establishment—accrued mental health care days, total N[N(7)] 89

Person—activity and participation life area, code (ICF 2001) AN[NNN] 92

Injury event—activity type, code (ICD-10-AM 7th edn) ANNNN 96

Injury event—activity type, non-admitted patient code N[N] 98

Birth event—setting of birth (actual), code N 100

Person—acute coronary syndrome procedure type, code NN 102

Person with acute coronary syndrome—type of acute coronary syndrome related clinical event experienced, code N[N] 106

Person—acute coronary syndrome related medical history, code NN 111

Person—acute coronary syndrome risk stratum, code N 116

Patient—additional body function or structure affected, body function or structure code N[N] 120

Health-care incident—additional clinician specialty involved in health-care incident, clinical specialties code N[N] 123

Episode of care—additional diagnosis, code (ICD-10-AM 7th edn) ANN{.N[N]} 131

Medical indemnity claim—additional incident or allegation type, health-care code NN[N] 134

Person (address)—address line, text [X(180)] 141

Service provider organisation (address)—address line, text [X(180)] 144

Address—address site name, text X[50] 148

Person (address)—address type, code N 150

Service provider organisation (address)—address type, code N 153

Administrative health region—region name, text [A(80)] 155

Administrative health region—palliative care strategic plan indicator, yes/no code N 156

Episode of admitted patient care—admission date, DDMMYYYY 158

Episode of admitted patient care—admission time, hhmm 160

Episode of admitted patient care—patient election status, code N 162

Specialised mental health service—admitted patient service unit identifier, XXXXXX 165

Specialised mental health service—admitted patient service unit name, text XXX[X(97)] 167

Person—age, total years N[NN] 169

Female—age at first pregnancy, total years N[N] 171

Person—age range, code NN 172

Person—alcohol consumption frequency, AUDIT alcohol consumption frequency code N 175

Person—alcohol consumption frequency (self-reported), code NN 177

Person—alcohol consumption amount (self-reported), total standard drinks NN 179

Person—alcohol consumption status recorded indicator, yes/no code N 182

Specialised mental health service—ambulatory service unit identifier, XXXXXX 184

Specialised mental health service—ambulatory service unit name, text XXX[X(97)] 186

Birth event—anaesthesia administered, code N 188

Birth event—analgesia administered, code N 190

Person—angina status, Canadian Cardiovascular Society code N 192

Person—angiotensin converting enzyme inhibitors therapy status, code NN 194

Female—number of antenatal care visits, total N[N] 196

Elective surgery waiting list episode—anticipated accommodation status, code N 198

Birth—Apgar score (at 1 minute), code NN 200

Birth—Apgar score (at 5 minutes), code NN 201

Registered health professional—principal area of practice, dental code NN 203

Registered health professional—principal area of practice, midwifery code NN 207

Registered health professional—principal area of practice, nursing code NN 210

Registered health professional—principal area of practice, psychology code NN 214

Person—area of usual residence, geographical location code (ASGC 2011) NNNNN 217

Person—area of usual residence, statistical area level 2 (SA2) code (ASGS 2011) N(9) 220

Person—aspirin therapy status, code NN 224

Person—need for assistance with activities in a life area, code N 226

Prison entrant—at risk of suicide or self-harm indicator, yes/no code N 229

Address—Australian postcode, code (Postcode datafile) {NNNN} 231

Person—Australian state/territory of birth, code N 234

Person—Australian state/territory identifier, code N....237

Establishment—Australian state/territory identifier, code N....240

Jurisdiction—Australian state/territory identifier, code N 244

Service provider organisation—Australian state/territory identifier, code N 246

Address—Australian state/territory identifier, code AA[A] 248

Occupied bed—hospital in the home care, average number of beds N[NNN.N] 250

Available bed—overnight-stay admitted care, average number of beds N[NNN.N] 252

Available bed—residential mental health care, average number of beds N[NNN.N] 255

Available bed—same-day admitted care, average number of beds N[NNN.N] 257

Available bed—neonatal admitted care (Non-special-care), average number of beds N[NNN.N]....261

Episode of care—behaviour-related risk factor intervention, code NN....264

Episode of care—behaviour-related risk factor intervention purpose, code N....266

Person—beta-blocker therapy status, code NN 268

Birth—birth order, code N....270

Birth event—birth plurality, code N....272

Birth—birth weight, code N 274

Person—birth weight recorded indicator, yes/no code N....276

Person—bleeding episode status, Thrombolysis in Myocardial Infarction (TIMI) code N 277

Person—blindness, code N....279

Person—blood pressure measurement result less than or equal to 130/80 mmHg indicator, yes/no code N 281

Person—blood pressure measurement result recorded indicator, yes/no code N....283

Person—blood pressure (diastolic) (measured), millimetres of mercury NN[N] 284

Person—blood pressure (systolic) (measured), millimetres of mercury NN[N] 288

Person—blow to the head indicator, yes/no/not stated/inadequately described code N....291

Person—bodily location of main injury, code NN 292

Person—body function, code (ICF 2001) AN[NNNN]....295

Person—body mass index recorded indicator, yes/no code N....299

Adult—body mass index (measured), ratio NN[N].N[N] 301

Adult—body mass index (self-reported), ratio NN[N].N[N] 305

Child—body mass index (measured), ratio NN[N].N[N] 309

Child—body mass index (self-reported), ratio NN[N].N[N] 313

Person—body mass index (classification), code N[.N] 317

Person—body structure, code (ICF 2001) AN[NNNN] 322

Person (address)—building/complex sub-unit type, code A[AAA] 326

Service provider organisation (address)—building/complex sub-unit type, code A[AAA] 328

Electrocardiogram—bundle-branch block status, code N 331

Person—C-reactive protein level (measured), total milligrams per litre N[NN].N 333

Female—caesarean section indicator (last previous birth) code N 335

Cancer treatment—non-surgical cancer treatment completion date, DDMMYYYY 337

Cancer treatment—non-surgical cancer treatment start date, DDMMYYYY 338

Cancer staging—cancer staging scheme source edition number, code N[N] 339

Person with cancer—distant metastasis status, M stage (UICC TNM Classification of Malignant Tumours, 7th ed) code X[XX] 341

Person with cancer—regional lymph node metastasis status, N stage (UICC TNM Classification of Malignant Tumours, 7th ed) code X[XX] 344

Person with cancer—extent of primary cancer, stage grouping other, code X[XXXXX] 347

Person with cancer—primary tumour status, T stage (UICC TNM Classification of Malignant Tumours, 7th ed) code X[XXX] 349

Person with cancer—extent of primary cancer, TNM stage (UICC TNM Classification of Malignant Tumours, 7th ed) code X[XX] 352

Patient—cancer status, code N 355

Cancer treatment—cancer treatment type, code N[N] 357

Cancer treatment—target site for cancer treatment, code (ICD-10-AM 7th edn) ANN{.N[N]} 360

Cancer treatment—target site for cancer treatment, code (ICDO-3) ANN 361

Organisation—capital consumption expenses, total Australian currency NNNNN.N 362

Person—cardiovascular disease recorded indicator, yes/no code N 365

Person—cardiovascular medication taken (current), code N 367

Hospital service—care type, code N[N].N 369

Non-admitted patient service event—care type, subacute (derived) code N 377

Specialised mental health service organisation—carer participation arrangements status (carer consultants employed), code N 380

Specialised mental health service organisation—carer participation arrangements status (carer satisfaction surveys), code N 382

Specialised mental health service organisation—carer participation arrangements status (formal complaints mechanism), code N 384

Specialised mental health service organisation—carer participation arrangements status (formal participation policy), code N 386

Specialised mental health service organisation—carer participation arrangements status (regular discussion groups), code N 388

Person—carer responsibility indicator, yes/no/not stated/inadequately described code N 390

Person—cataract status, code N 392

Elective care waiting list episode—category reassignment date, DDMMYYYY..........394

Hospital census (of elective surgery waitlist patients)—census date, DDMMYYYY 396

Person—government funding identifier, Centrelink customer reference number {N(9)A}..........397

Person—cerebral stroke due to vascular disease (history), code N..........399

Female—cervical screening indicator, yes/no/not stated/inadequately described code N 401

Person—nature of impairment of body structure, code (ICF 2001) N 403

Cancer treatment—chemotherapy completion date, DDMMYYYY 407

Cancer treatment—chemotherapy cycles administered, number of cycles N[NN] 409

Cancer treatment—chemotherapy start date, DDMMYYYY..........412

Person—chest pain pattern, code N 414

Person—high-density lipoprotein cholesterol level (measured), total millimoles per litre [N].NN..........416

Person—low-density lipoprotein cholesterol level (calculated), total millimoles per litre N[N].N..........418

Person—cholesterol level (measured), total millimoles per litre N[N].N 420

Person—chronic condition indicator, yes/no code N..........422

Person—chronic obstructive pulmonary disease recorded indicator, yes/no code N..........424

Medical indemnity claim management episode—class action indicator, yes/no code N..........426

Health professional—occupation, code ANN..........428

Episode of treatment for alcohol and other drugs—client type, code N..........432

Patient—clinical emergency indicator, yes/no code N 434

Person—clinical evidence status (acute coronary syndrome related medical history), yes/no code N 435

Person—clinical procedure timing, code N 439

Health-care incident—clinical service context, code N[N] 440

Health-care incident—clinical service context, text X[X(39)] 445

Elective surgery waiting list episode—clinical urgency, code N 446

Person—clopidogrel therapy status, code NN 448

Specialised mental health service—co-location with acute care hospital, code N 450

Patient—compensable status, code N 452

Address—complex road name, text X[45] 454

Address—complex road number 1, road number X[6] 456

Address—complex road number 2, road number X[6] 458

Address—complex road type, code AA[AA] 460

Birth event—complication, code (ICD-10-AM 7th edn) ANN{.N[N]} 467

Pregnancy (current)—complication, code (ICD-10-AM 7th edn) ANN{.N[N]} 469

Episode of admitted patient care—condition onset flag, code N 471

Person—congenital malformation, code (ICD-10-AM 7th edn) ANN{.N[N]} 475

Person—congenital malformation, code (BPA 1979) ANN.N[N] 477

Specialised mental health service organisation—consumer committee representation arrangements, code N 479

Specialised mental health service organisation—consumer participation arrangements (consumer consultants employed), code N 481

Specialised mental health service organisation—consumer participation arrangements (consumer satisfaction surveys), code N 483

Specialised mental health service organisation—consumer participation arrangements (formal complaints mechanism), code N 485

Specialised mental health service organisation—consumer participation arrangements (formal participation policy), code N 487

Specialised mental health service organisation—consumer participation arrangements (regular discussion groups), code N 489

Contracted hospital care—organisation identifier, NNX[X]NNNNN 491

Episode of care (procedure)—contracted procedure flag, code N 492

Hospital—contract role, code A 494

Hospital—contract type, code N 495

Contracted hospital care—contracted care commencement date, DDMMYYYY 497

Contracted hospital care—contracted care completed date, DDMMYYYY 498

Service provider organisation—coordinator of volunteers indicator, yes/no code N 499

Person—coronary artery bypass graft location, code N 501

Person—coronary artery disease intervention (history), code N 502

Person—coronary artery stenosis location, code N 505

Person (address)—country identifier, code (SACC 2011) NNNN 507

Person—country of birth, code (SACC 2011) NNNN 509

Registered health professional—country of employment in registered profession, Australia/other country code N 513

Laboratory standard—upper limit of normal range for creatine kinase isoenzyme, total units per litre N[NNN] 515

Person—creatine kinase isoenzyme level (measured), total units per litre N[NNN] 517

Person—creatine kinase myocardial band isoenzyme level (measured), index code X[XXX] 519

Person—creatine kinase myocardial band isoenzyme level (measured), total kCat per litre N[NNN] 521

Person—creatine kinase-myocardial band isoenzyme level (measured), total micrograms per litre N[NNN] 523

Person—creatine kinase myocardial band isoenzyme level (measured), total nanograms per decilitre N[NNN] 525

Person—creatine kinase myocardial band isoenzyme level (measured), percentage N[NNN] 527

Person—creatine kinase-myocardial band isoenzyme level (measured), total units per litre N[NNN] 529

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total units per litre N[NNN] 531

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, index code X[XXX] 533

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total kCat per litre N[NNN] 535

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total micrograms per litre N[NNN] 537

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, total nanograms per decilitre N[NNN] 539

Laboratory standard—upper limit of normal range for creatine kinase myocardial band isoenzyme, percentage N[NNN] 541

Person—creatinine serum level, total micromoles per litre NN[NN] 543

Person—current opioid pharmacotherapy treatment program indicator, yes/no code N 546

Person—current smoking status indicator, yes/no/not stated/inadequately described code N 548

Person—cardiovascular disease condition targeted by drug therapy, code NN....550

Date—accuracy indicator, code AAA....552

Person—C-reactive protein level measured date, DDMMYYYY 558

Person—creatine kinase myocardial band isoenzyme measured date, DDMMYYYY 559

Person—creatinine serum level measured date, DDMMYYYY 560

Health-care incident—date health-care incident occurred, DDMMYYYY....561

Person with acute coronary syndrome—acute coronary syndrome related clinical event date, DDMMYYYY 563

Person—date of birth, DDMMYYYY....564

Episode of treatment for alcohol and other drugs—treatment cessation date, DDMMYYYY 569

Episode of admitted patient care (newborn)—date of change to qualification status, DDMMYYYY....571

Episode of treatment for alcohol and other drugs—treatment commencement date, DDMMYYYY....572

Pregnancy (last previous)—pregnancy completion date, DDMMYYYY 574

Person—coronary artery bypass graft date, DDMMYYYY....576

Person—date of death, DDMMYYYY 577

Patient—diagnosis date, DDMMYYYY....579

Patient—diagnosis date of cancer, DDMMYYYY 580

Patient—diagnosis date (first recurrence of cancer), DDMMYYYY 582

Patient—diagnosis date of first recurrence as distant metastasis, DDMMYYYY 583

Patient—diagnosis date of first recurrence as locoregional cancer, DDMMYYYY 586

Person—diagnostic cardiac catheterisation date, DDMMYYYY 589

Electrocardiogram— electrocardiogram date, DDMMYYYY....590

Community nursing service episode—first contact date, DDMMYYYY....591

Episode of care (community setting)—first service delivery date, DDMMYYYY 593

Functional stress test—test date, DDMMYYYY 595

Person—implantable cardiac defibrillator procedure date, DDMMYYYY....596

Person—intra-aortic balloon pump procedure date, DDMMYYYY 597

Person—intravenous fibrinolytic therapy date, DDMMYYYY 598

Community nursing service episode—last contact date, DDMMYYYY...............................600

Patient—date of last contact, DDMMYYY..602

Person—most recent stroke date, DDMMYYYY 604

Person—non-invasive ventilation administration date, DDMMYYYY................................605

Person—acute coronary syndrome symptoms onset date, DDMMYYYY 606

Person—pacemaker insertion date, DDMMYYYY 608

Person—primary percutaneous coronary intervention date, DDMMYYYY.........................609

Episode of admitted patient care (procedure)—procedure commencement date, DDMMYYYY 610

Health service event—referral to rehabilitation service date, DDMMYYYY 612

Person—rescue percutaneous coronary intervention date, DDMMYYYY 613

Person—revascularisation percutaneous coronary intervention date, DDMMYYYY 614

Non-admitted patient emergency department service episode—triage date, DDMMYYYY 616

Ventricular ejection fraction test—test date, DDMMYYYY...618

Health service event—presentation date, DDMMYYYY 619

Emergency department stay—presentation date, DDMMYYYY..621

Person—troponin level measured date, DDMMYYYY..623

Establishment—number of day centre attendances, total N[NNNN] 624

Person with cancer—degree of spread of a cancer, code N 626

Person—government funding identifier, Department of Veterans' Affairs file number AAXXNNNNA 629

Episode of care—funding eligibility indicator (Department of Veterans Affairs), code N...633

Person—dependency in activities of daily living (bathing), code N.....................................635

Person—dependency in activities of daily living (bed mobility), code N 637

Person—dependency in activities of daily living (bladder continence), code N 639

Person—dependency in activities of daily living (bowel continence), code N 641

Person—technical nursing care requirement (day-time), total minutes NNN 643

Person—dependency in activities of daily living (dressing), code N 646

Person—dependency in activities of daily living (eating), code N..648

Person—technical nursing care requirement (evening), total minutes NNN.......................650

Person—dependency in activities of daily living (extra surveillance), code N 653

Person—technical nursing care requirement (infrequent), total minutes NNN 655

Person—dependency in activities of daily living (mobility), code N 658

Person—technical nursing care requirement (night-time), total minutes NNN 660

Person—dependency in activities of daily living (toileting), code N 663

Person—dependency in activities of daily living (transferring), code N 665

Person—diabetes mellitus status, code NN 667

Person—diabetes therapy type, code NN 671

Episode of admitted patient care—diagnosis related group, code (AR-DRG v 6) ANNA 674

Person—level of difficulty with activities in life areas, code (ICF 2001) N...........................677

Prison entrant—distress related to current imprisonment indicator, yes/no/not applicable code N 681

Division of general practice—organisation identifier, NNN 683

Person—dyslipidaemia treatment with anti-lipid medication indicator (current), code N 684

Person—electrocardiogram Q waves indicator, yes/no code N 686

Prison entrant—education attendance status 30 days prior to imprisonment, education attendance status code N...688

Electrocardiogram—new Q waves indicator, yes/no code N 691

Electrocardiogram—lead V4R presence indicator, yes/no code N 693

Electrocardiogram— ST-segment-elevation in lead V4R indicator, yes/no code N...695

Electrocardiogram—change location, code N 697

Electrocardiogram—change type, code N 699

Person (address)—electronic communication address, text [X(250)] 702

Service provider organisation (address)—electronic communication address, text [X(250)] 704

Person (address)—electronic communication medium, code N...706

Service provider organisation (address)—electronic communication medium, code N 708

Person (address)—electronic communication usage, code N..710

Emergency department stay—transport mode (arrival), code N 712

Non-admitted patient emergency department service episode—clinical care commencement date, DDMMYYYY 714

Non-admitted patient emergency department service episode—clinical care commencement time, hhmm...718

Non-admitted patient emergency department service episode—service commencement date, DDMMYYYY 722

Non-admitted patient emergency department service episode—episode end date, DDMMYYYY 725

Non-admitted patient emergency department service episode—episode end time, hhmm....727

Emergency department stay—physical departure date, DDMMYYYY 729

Emergency department stay—physical departure time, hhmm 732

Non-admitted patient emergency department service episode—episode end status, code N....734

Non-admitted patient emergency department service episode—service commencement time, hhmm....736

Non-admitted patient emergency department service episode—waiting time (to hospital admission), total hours and minutes NNNN 740

Emergency department stay—waiting time (to commencement of clinical care), total minutes NNNNN....742

Organisation—employee related expenses, total Australian currency NNNNN.N....744

Person—labour force status, acute hospital and private psychiatric hospital admission code N 747

Registered health professional—labour force status, registered health professional code N....749

Person—labour force status, public psychiatric hospital admission code N....751

Person—environmental factor, code (ICF 2001) AN[NNN]....754

Episode of residential care—episode end date, DDMMYYYY....758

Episode of residential care—episode end mode, code N....759

Episode of residential care—episode start date, DDMMYYYY....761

Episode of residential care—episode start mode, code N....762

Person (male)—erectile dysfunction, code N 763

Establishment—organisation identifier (Australian), NNX[X]NNNNN....765

Establishment—organisation identifier (state/territory), NNNNN....768

Establishment—sector, code N 769

Establishment—establishment type, sector and services provided code AN.N{.N}....771

Person—estimated glomerular filtration rate (eGFR) recorded indicator, yes/no code N 777

Female—ever been pregnant indicator, yes/no/not stated/inadequately described code N 779

Person—ever smoked a full cigarette indicator, yes/no/not stated/inadequately described code N 781

Registered health professional—extended leave status in registered profession, code N 783

Elective surgery waiting list episode—extended wait patient indicator, code N 785

Patient—extent of harm from a health-care incident, code N[N] 787

Person—extent of participation in a life area, code (ICF 2001) N 790

Injury event—external cause, code (ICD-10-AM 7th edn) ANN{.N[N]} 794

Injury event—external cause, non-admitted patient code NN 796

Injury event—human intent of injury, code NN 800

Person (name)—family name, text X[X(39)] 802

Health service event—fasting indicator, code N 809

Service provider organisation—feedback collection indicator, yes/no code N 811

Service provider organisation—feedback collection method, code N 813

Person—fibrinolytic drug administered, code N 815

Person—fibrinolytic therapy status, code NN 816

Registered health professional—principal field of medicine, medical practitioner code N 818

Pregnancy—first day of the last menstrual period, date DDMMYYYY 820

Health service event—first service contact date, DDMMYYYY 821

Person—first language spoken, code (ASCL 2011) NN{NN} 823

Prison entrant—first time in prison or juvenile detention indicator, yes/no code N 826

Person (address)—floor/level type, code A[A] 828

Service provider organisation (address)—floor/level type, code A[A] 830

Person—foot deformity indicator, code N 831

Person—foot lesion indicator (active), code N 834

Person—foot ulcer indicator (history), code N 836

Person—foot ulcer indicator (current), code N 838

Person—formal community support access indicator (current), code N 840

Person—consumption of 6 or more standard drinks on one occasion, AUDIT consumption of 6 or more standard drinks code N 842

Establishment (mental health)—full-time equivalent staff (paid), total N[NNN{.N}] 844

Establishment—full-time equivalent staff (paid) (administrative and clerical staff), average N[NNN{.N}] 847

Establishment—full-time equivalent staff (paid), average N[NNN{.N}] 849

Establishment—full-time equivalent staff (paid) (carer consultants), average N[NNN{.N}] 852

Establishment—full-time equivalent staff (paid) (consultant psychiatrists and psychiatrists), average N[NNN{.N}]....854

Establishment—number of individual session occasions of service for non-admitted patients (pathology), total N[NNNNNN]....1178

Establishment—number of individual session occasions of service for non-admitted patients (pharmacy), total N[NNNNNN]....1181

Establishment—number of individual session occasions of service for non-admitted patients (radiology and organ imaging), total N[NNNNNN]....1183

Service contact—group session status, individual/group session indicator code ANN.N....1186

Birth—birth weight, total grams NNNN....1187

Person—extent of environmental factor influence, code (ICF 2001) [X]N....1189

Person—influenza immunisation indicator, yes/no code N....1194

Person—informal carer existence indicator, code N....1195

Patient—initial visit since diagnosis indicator (diabetes mellitus), code N **1199**

Health service event—prison health clinic visit initiator, code N **1201**

Client—injecting drug use status, code N **1202**

Person with acute coronary syndrome—bleeding location, instrumented code N(N) **1204**

Episode of admitted patient care—intended length of hospital stay, code N **1207**

Birth event—setting of birth (intended), code N.. **1209**

Registered health professional—intended years in profession, total years NN **1211**

Patient—intention of treatment, code N **1213**

Cancer treatment—intention of treatment, code N **1215**

Episode of care—inter-hospital contracted patient status, code N...Error! Bookmark not defined.

Episode of care—inter-hospital contracted patient status, code N **1217**

Person—interpreter service required, yes/no code N **1220**

Feedback and contact details

The development of the data dictionaries is an ongoing process, reliant on the support and input of a range of data development groups to expand its scope and utility.

The data committees welcome feedback on existing metadata standards in the data dictionaries, and also submissions (either for new data items, modifications to existing items, or information on your data development activities).

Please feel free to contact the AIHW by any of the means listed below.

METeOR and Metadata Unit

For further information about the data dictionaries and for any comments and suggestions about national standards development processes, please contact the METeOR and Metadata Unit at the AIHW.

Phone: (02) 6244 1000

Fax: (02) 6244 1299

Email: datadevelopment@aihw.gov.au

Data Development Hotline

Phone: (02) 6244 1222

AIHW secretariat

For further information about the national data committees and their processes, contact the Executive Unit at the AIHW.

Phone: (02) 6244 1033

Fax: (02) 6244 1111

Further information can also be obtained from the Committees page on the AIHW website: <http://www.aihw.gov.au/committees/index.cfm>.

The National Health Data Dictionary provides national standards for the broader health sector. This update reflects changes to data standards between 1 July 2010 and 30 April 2012. During this time 10 data set specifications, 23 data element clusters, 177 data elements, one classification and 20 glossary items have been added. Twelve national minimum data sets, two data set specifications, 96 data elements, five classifications and three glossary items have been superseded, and three national standards have been retired since Version 15 of the NHDD was published.

National Health Data Dictionary Version 16, 2012
